- 55070 17. It is a sad comment on our age that it seems so incomprehensible to many that anyone should ever have been punished just for adultery. Conspiracies or other political machinations have to be discovered as the 'real' causes of events. See A. Ferrill, 'Augustus and His Daughter: a Modern Myth', in C. Deroux (ed.), *Studies in Latin Literature and Roman History II* (Collection Latomus 168: Brussels, 1980), 332-46, for a similar dispute concerning the 'real' reason for the exile by Augustus of his daughter Julia to the island of Pandateria in 2 B.C. A recent exception is G. Marasco, 'Constantino e le uccisioni di Crispo e Fausta (326DC)', *Rivista di Filologia e di Istruzione Classica* 121 (1993), 297-317, who argues that Crispus and Fausta were executed not so much for adultery, but for incest; I thank Prof. T. G. Elliott for drawing this last to my attention.
- 55075 18. P. Guthrie, 'The Execution of Crispus', *Phoenix* 20 (1966), 325-31.
- 55080 19. Pohlsander, art. cit. (n. 14), 105-6.
20. Pan. Lat. 1A refers to Minervina, the mother of Crispus, as Constantine's wife, which seems proof that he was legitimate. In general, see Barnes, op. cit. (n. 2), 36, 42-3; also, J. E. Grubbs, *Law and Family in Late Antiquity: the Emperor Constantine's Marriage Legislation* (Oxford, 1995), 306-7.

33. From the translation by B. Jackson, *Nicene and Post-Nicene Fathers III*.
34. See F. Yeghli, *Baths and Bathing in Classical Antiquity* (Cambridge, Mass., 1992), 352-5.
35. There is some dispute over the exact location of these baths. Eusebius (KC4.61) claims that Constantine visited the hot baths of his own city, by which he must mean Constantinople, while Zonaras (Epit. 13.4.25-27) claims that he sailed across to visit hot springs at Soteropolis in Asia Minor. It is possible that he visited both.
- 55120 36. On the life, works, and nachleben of Soranus, see A. E. Hanson, 'Soranus of Ephesus: Methodicorum Princeps', in W. Haase and H. Temporini (edd.), *ANRW II.37.2* (Berlin, 1994), 968-1075.
- 55125 37. The following passages of translation are from O. Temkin, *Soranus' Gynecology* (Baltimore, 1956).
38. Suet. Domit. 22.
39. See E. Eyben, 'Family Planning in Graeco-Roman Antiquity', *AncSoc* 11/12 (1980/81), 582; also, W. V. Harris, 'Child-Exposure in the Roman Empire', *JRS* 84 (1994), 1-22. 40. E.g., Jerome, Ep. 22.13; Basil, Ep. 188 Canon 2.
- 55130 41. Barnes, op. cit. (n. 2), 44, on C.Th. 9.38.1 and Porphyrius, Carm. 10.
42. Eyben, art. cit. (n. 39), 62-74.
43. A number of other imperial ladies were probably available also to help Helena if she so required, including Eutropia, Fausta's own mother, and Constantia, Constantine's sister. On the last, see now H. A. Pohlsander, 'Constantia', *AncSoc* 25 (1994), 151-67.
- 55135 44. Imperial ladies, even Christians, were no less likely to be aware of various methods of contraception or abortion than any other group. E.g., Eusebia, wife of Constantius II (337-

61), was alleged to have tricked Helena, the wife of Julian Caesar, into drinking a potion that caused her to miscarry (Amm. 16.10.18). Theodora, the wife of Justinian I (527–65), was alleged to have had many abortions during her years as an 'actress' (Proc. Anec. 9.19, 17.16).
 45. Eus, VC 3.42–6. Grant, op. cit. (n. 27), 115, refers to 'Constantine's dispatch of his mother Helena to the Holy Land, in the hope of expiation'.
 46. On Fausta's location, see, e.g., Barnes, op. cit. (n. 23), 221; Drijvers, art. cit. (n. 22), 506. On Crispus' journeys and residence, see Barnes, op. cit. (n. 2), 83–4.
 47. The evidence for the imperial journeys of the period 283–337 has been collected by Barnes, op. cit. (n. 2), but there is no evidence that anyone else happened ever to visit Pola other than Crispus. The same is true of the period 337–361, on which see Barnes, Athanasius and Constantius: Theology and Politics in the Constantinian Empire (Cambridge, Mass., 1993), 218–228, with one exception, the ex-Caesar Gallus who passed near Pola on his way to exile at Flanona on a nearby island (Amm. 14.11.20; Cons. Constant, s.a. 354; Soc. HE 2.34).
 48. Other 4th-century exiles to the Dalmatian islands include the ex-magister officiorum Florentius in 361 (Amm. 22.3.6), and the ex-proconsul of Africa Hymetius c.371 (Amm. 28.1.23).
 49. See Barnes, 'Two Senators Under Constantine', JRS 64 (1975), 40–9, on Firm. Mat. Math. 2.29.10. 50. So Pohlsander, art. cit. (n. 14), 104, argues that Crispus was 'confronted by an imperial emissary and allowed to choose the means of death'.
 51. Eutr. Brev. 10.6.1; Epit. 41.7; Zos. HN 2.28. The claim that Licinius was trying to raise a revolt once more, Soc. HE 1.4, seems simply a propaganda effort by Constantine, or his flatterers, to justify this crime.
 52. Philost. HE 4.1; Art. Pass. 15.
 53. See, e.g., P. White, 'The Authorship of the Historia Augusta', JRS 57 (1967), 115–33; T. Honore, 'Scriptor Historiae Augustae', JRS 77 (1987), 156–76. The Historia Augusta is usually dated by means of its perceived dependency upon a variety of late antique texts which include works by Eunapius, Claudian, and Vegetius. Unfortunately, though, the dates of composition of many of these works are themselves subject to dispute. English-speaking scholars generally date its composition c. 395.
 54. See H. W. Bird, 'Diocletian and the Deaths of Carus, Numerian and Carinus', Latotnus 35 (1976), 123–32.
 55. Aur. Viet. De Caes. 39.11; Eutr. Brev. 9.20; Epit. 37.7–8.
 56. From the Loeb translation by D. Magie, The Scriptores Historiae Augustae III (Cambridge, Mass., 1932), 443–5.
 57. See, e.g., R. Syme, Ammianus and the Historia Augusta (Oxford, 1968), passim.
 58. See R. Turcan, 'Heliogabale précurseur de Constantin?', BAGB (1988), 38–52; G. Fowden, 'Constantine's Porphyry Column: the Earliest Literary Allusion', JRS 81 (1991), 119–31. 59. Fowden, art. cit. (n. 58), 120, on V. Heliogab. 13–14.
 60. That prostitutes often entertained their clients at the baths is sufficient proof that male and female could tolerate the same water. In general, see R. Bowen Ward, 'Women in Roman Baths', HThR 85 (1992), 125–47; also c. Dauphin, 'Brothels, Baths, and Babes: Prostitution in the Byzantine Holy Land', Classics Ireland 3 (1996), 47–72.
 61. See A. Chastagnol, 'Etudes sur la Vita Can IX: Non est meus', in G. Bonamente and F. Paschoud (edd.), Historiae Augustae Colloquium Genevense: Atti dei Convegni sulla Historia Augusta II (Bari, 1994), 89–99, esp. 92, on adultery, and 98, on Crispus and Fausta.
 62. See Chastagnol, 'Etude sur la Vita Can VIII: Carin et Elagabal', in J. Straub (ed.), Bonner Historia-Augusta-Colloquium 1979–81 (Bonn, 1985), 99–113. 63. Pohlsander, art. cit. (n. 14), 103, rejects the possibility that Fausta died by accident in her bath on the basis that Constantine did not restore her memory, or honour her with 'a splendid funeral, orations, and monuments'. But accidents continue to happen even to people deep in disgrace.

Fifty Bibles of Constantine

It is speculated that this commission may have provided motivation for the development of the canon lists and that Codex Sinaiticus and Codex Vaticanus are possible surviving examples of these Bibles. There is no evidence among the records of the First Council of Nicaea of any determination on the canon; however, Jerome, in his Prologue to Judith, makes the claim that the Book of Judith was "found by the Nicene Council to have been counted among the number of the Sacred Scriptures".

[circa 330]
 See for example: [Great uncial codices](#)

Constantine I (reigned 306–337) adopted Christianity as his system of belief after the Battle of Milvian Bridge in 312. His victorious legions fought under the "labarum", a standard with the first two Greek letters of Christ's name (XP). In 313 the Edict of Milan legalised Christianity alongside other religions allowed in the Roman Empire. In 325 the First Council of Nicaea signalled consolidation of Christianity under an orthodoxy endorsed by Constantine, and though this did not make

other Christian groups outside the adopted definition illegal, the dissenting Arian bishops were initially exiled. But Constantine reinstated Arius just before the heresiarch died in 336 and exiled the Orthodox Athanasius of Alexandria from 335 to 337. In 380 Emperor Theodosius I made Christianity the Roman Empire's official religion (see State church of the Roman Empire, Byzantine Empire and the Goths) and did enforce the edict. In 392 Theodosius passed legislation prohibiting all pagan cultic worship.

During the 4th century, however, there was no real unity between church and state: in the course of the Arian controversy, Arian or semi-Arian emperors exiled leading Trinitarian bishops, such as Athanasius (335, 339, 356, 362, 365) Hilary of Poitiers (356), and Gregory of Nyssa (374); just as leading Arian and Anomoean theologians such as Aëtius (fl. 350) also suffered exile.

Towards the end of the century, Bishop Ambrose of Milan made the powerful Emperor Theodosius I (reigned 379–395) do penance for several months after the massacre of Thessalonica (390) before admitting him again to the Eucharist. On the other hand, only a few years later, Chrysostom, who as bishop of Constantinople criticized the excesses of the royal court, was eventually banished (403) and died (407) while traveling to his place of exile.

The Fifty Bibles of Constantine

were Bibles in the original Greek language commissioned in 331 by Constantine I and prepared by Eusebius of Caesarea. They were made for the use of the Bishop of Constantinople in the growing number of churches in that very new city. Eusebius quoted the letter of commission in his Life of Constantine, and it is the only surviving source from which we know of the existence of the Bibles.

It is speculated that this commission may have provided motivation for the development of the canon lists and that Codex Sinaiticus and Codex Vaticanus are possible surviving examples of these Bibles. There is no evidence among the records of the First Council of Nicaea of any determination on the canon; however, Jerome, in his Prologue to Judith, makes the claim that the Book of Judith was "found by the Nicene Council to have been counted among the number of the Sacred Scriptures". According to Eusebius, Constantine I wrote him in his letter:

I have thought it expedient to instruct your Prudence to order fifty copies of the sacred Scriptures, the provision and use of which you know to be most needful for the instruction of the Church, to be written on prepared parchment in a legible manner, and in a convenient, portable form, by professional transcribers thoroughly practised in their art.

About accomplishing the Emperor's demand:

Such were the emperor's commands, which were followed by the immediate execution of the work itself, which we sent him in magnificent and elaborately bound volumes of a threefold and fourfold form.

This is the usual way in which Eusebius' text is translated, but there are more possibilities, because the phrase "ἐν πολυτελῶς ἡσκευμένοις τεύχεσιν τρισσὰ καὶ τετρασσὰ διαπεψφάντων ἡμῶν" has many meanings:

Three or four codices were prepared at a time – Kirsopp Lake and Bernard de Montfaucon;

Codices were sent in three or four boxes – F. A. Heinichen;

Codices were prepared in with three or four folios – Scrivener;

Text of the codices was written in three or four columns per page – Tischendorf, Gebhardt, and Gregory, Kirsopp Lake;

Codices were sent by threes or fours.

Some codices contained three gospels (Matthew, Mark, and Luke) but others included four gospels (including John) – Eduard Schwartz.

Athanasius of Alexandria referred to another request of producing Bible manuscripts: "I sent to him volumes containing the holy Scriptures, which he had ordered me to prepare for him". Athanasius could have received this request between 337–339.

Constantin von Tischendorf, discoverer of Codex Sinaiticus, believed that Sinaiticus and Vaticanus were among these fifty Bibles prepared by Eusebius in Caesarea.

According to him, they were written with three (as Vaticanus) or four columns per page (as Sinaiticus). Tischendorf's view was supported by Pierre Batiffol.

Frederick Henry Ambrose Scrivener rejected Tischendorf's speculation because of differences between the two manuscripts. In Sinaiticus, the text of the Gospels is divided according to the Ammonian Sections with references to the Eusebian Canons,

- 55275 but Vaticanus used the older system of division. Vaticanus was prepared in a format of 5 folios in one quire, but Sinaiticus had 8 folios. According to Scrivener, Eusebian Bibles contained three or four folios per quire (Scrivener used a Latin version of Valesius). Scrivener stated that the Eusebian is unclear and should not be used for a doubtful theory.
- 55280 Westcott and Hort argued the order of biblical books on the Eusebian list of the canonical books, quoted by Eusebius in "Ecclesiastical History" (III, 25), is different from every surviving manuscript. Probably none of the 50 copies survive today.
- 55285 Caspar René Gregory believed that Vaticanus and Sinaiticus were written in Caesarea, and they could belong to the Eusebian fifty. According to Victor Gardthausen Sinaiticus is younger than Vaticanus by at least 50 years.
- 55290 Kirsopp Lake states "copies of three and four columns" is grammatically sound, but there appears not to be good evidence for this technical use of the words. "Sending them by threes or fours" is the most attractive, but there is no evidence that τρισσα can denote "three at a time". Regarding "in three or four columns per page," there is only one known manuscript written in that way - Sinaiticus. Sinaiticus has a curious spelling of the word κραβατιος as κραβακτιος; Sinaiticus spells Ισραηλειτης as Ισδραηλειτης, Vaticanus as Ισραηλειτης; these forms have been regarded as Latin, and they can find in papyri from Egypt. There is no other known Greek district in which these forms were used. The argument for a Caesarean origin of these two manuscripts is much weaker than Egyptian.
- 55295 According to Heinrich Schumacher, Eusebius instead prepared fifty lectionaries, not Bibles.
- 55300 Skeat argued that Sinaiticus was a first attempt to produce a full Bible in fulfillment of Constantine's order but was abandoned before completion in favor of a more compact form (then languishing in Caesarea until salvaged in the sixth century), while Vaticanus was one of the fifty Bibles actually delivered to Constantinople.
- 55305 Kurt Aland, Bruce M. Metzger, Bart D. Ehrman doubt that Sinaiticus and Vaticanus were copied by Eusebius on the Constantine order.

The Rubrics of the First Book of Lactantius Firmianus's
On the Divine Institutes Against the Pagans Begin

- 55310 This very rare work by Lucius Caecilius Firmianus Lactantius is one of the first books printed in Italy and the first dated Italian imprint. It was produced by the German typographers Conrad Sweynheym and Arnold Pannartz, who established a printing press in 1465 at the Benedictine abbey of Subiaco, near Rome. According to the colophon, the book was completed "In the year of Our Lord 1465, in the second year of the papacy of Paul II, the thirteenth indiction and the last day but two of the month of October. In the venerable monastery of Subiaco". Sweynheym and Pannartz moved to Rome in 1467 and by 1475 had printed 50 books, including works by church fathers and classical Roman authors. This volume contains the seven books of Lactantius's most important work, Divinarum institutionum libri VII (The divine institutions), and two minor works by the same author. Born in North Africa late in the third century AD, Lactantius was a teacher of rhetoric who, after his conversion, wrote works patterned after classical models that explained Christianity in ways intended to appeal to educated Romans still practicing the traditional religions of their empire. Written between 303 and 311, Divinarum institutionum argues the futility of pagan belief and the logic and truth of Christianity. The beginning of the volume contains a table of nine explanatory commentaries introducing the texts that follow. Throughout most of the book, the first letters of paragraphs are in red or blue, and the beginnings of chapters are handwritten in red. Initial capital letters illuminated with gold leaf open each of the nine books within the work. The volume was bound in gold-tooled red morocco leather in the middle of the 19th century.

Vervolging en de kunst van het tussen de regels schrijven:

- De vita beata, Lactantius en de Grote Christenvervolging
- 55335 Pastristici en historici hebben tot nu toe geen aandacht gehad voor Boek 7 (De vita beata) van de Divinae Institutiones van Lactantius. Dat boek, geschreven tussen 306 en 310, lijkt een pastiche van eindtijd-profetieën. Maar indien men het als een soort ex eventu profetie situeert in de ruimere context van de kritiek van Porphyrius van Tyr op het Boek Daniël, blijken de aanvallen op de twee regerende "beesten" te verwijzen naar de Keizers Diocletianus en Galerius, die zonet de "Grote
- 55340

Christenvervolging" hadden ingezet. In lijn hiermee kan men bovendien suggereren dat de "goddelijke koning" die de wereld zal redden en zijn alleenheerschappij zal vestigen voor een nieuw millennium niemand anders is dan Constantijn, die sinds 306 het noordwestelijke deel van het Rijk regeerde.

THE GENERAL COUNCIL IN THE FOURTH CENTURY

55370 ACADEMIC THESIS FOR THE OBTAINING OF THE DEGREE OF DOCTOR OF HOLY THEOLOGY AT THE ROMAN CATHOLIC UNIVERSITY OF NIJMEGEN, BY THE AUTHORITY OF THE ACTUAL RECTOR MAGNIFICUS PROF. B.H.D. HERMESDORF, PROFESSOR IN THE FACULTY OF LAW, ACCORDING TO A DECISION OF THE SENATE TO BE PUBLICLY DEFENDED IN THE AUDITORY OF THE UNIVERSITY ON FRIDAY 13 JULY 1945 AT 4 O'CLOCK IN THE AFTERNOON BY MONALD GOEMANS O.F.M. BORN IN HILLEGOM

55375 PROBLEM AND OBJECTIVE
Introduction

That no council can exist as "ecumenical" without a "cooperation" of the visible Supreme Head of the Church, the Bishop of Rome, is a truth that no Catholic can and will doubt. However, when Catholic scholars, dogmatists, canonists and historians
55380 want to determine in more detail what that cooperation of the Pope must consist of or has existed in the course of history, one encounters, besides great agreement and irrefutable certainty, not only different formulations of one and the same thing, but also divergent and even opposing opinions. Both, both the different formulations and the divergent, even opposing opinions, form an obstacle to a clear insight, a
55385 clouding becomes inevitable, moreover, because the authors repeatedly use vague expressions, do not seem to distinguish sufficiently between the various issues, even to confuse them or on the other hand want to make distinctions that give the impression of belonging more to dialectics than to logic. The following definition, given by J. Forget, of the concept of "ecumenical council": "An ecumenical or
55390 universal council is a solitary assembly of the universal eves, called upon and under authority and the presidency of the Roman Pontiff to liberate and legislate in common on matters of interest to the Christian faith"1), may sound ever so clear, concrete and distinct, but in reality this definition cannot boast of these so necessary characteristics. For if this definition is to claim to be correct, it must be
55395 applicable to the councils which are accepted as "ecumenical". From a historical point of view, however, numerous difficulties must arise, and the definition appears not only to be expressed in general terms, but even to be open to question, perhaps even incomplete. If we confine ourselves for the time being to the "cooperation" of the Pope, as described in the definition, then the historian is faced with the thorny
55400 question: was there any question of a convocation at the first eight General Councils held in the East by the Pope? Or also for this problem: how can the demand for papal presidency be reconciled with the facts of the second General Council in 381 in Constantinopel, where successively Meletius of Antioch presided, after his death Gregory of Nazianzus and after his abdication Nectarius of Constantinopel? Or with
55405 the facts of the fifth General Council in 553 also in Constantinopel, which was held against the wishes and without any cooperation of Pope Vigilius? Indeed, without the

Pope no General Council and that is undoubtedly firmly anchored in the above definition. But that the influence which the Pope has actually exercised on the Ecumenical Councils in the course of history has not always fully corresponded to the above requirements, is admitted by the same author, J. Forget, when he continues: "It is true that, in order to be ecumenical without restriction, it means that I have always been through my convocation, my celebration and the plurality of powers; but in all cases, according to my appreciation and traditional terminology, a council is not ecumenical, as it is not universal, that it is the legal representation, the authorized body of the whole Church; or, if you don't want to wait until the end of the day, you don't have to worry about it; And because of the intervention of the superior suffragans, the guarantee of *autorité absolue et universelle des décisions*. "De la vient que certains councils sont considérés comme ecuméniques pour partie seulement de leurs décrets, le concours ou l'approbation du saint-siège ayant manqué pour le reste" 2).

Here, then, a distinction is apparently made between General Councils "sans restriction aucune", to which the above-mentioned definition applies, and General Councils, to which not all of these characteristics are present and which are therefore general in a broader sense. For this category of General Councils, the terms "la représentation juridique, l'organe autorisé de toute l'Église, l'intervention du chef suprême, parce qu'elle garantira l'autorité absolue et universelle des décisions" apparently serve as a definition. The convocation and the meeting itself may, if necessary, lack something, as long as the deficiency is then supplemented by that "cooperation" (concours) of the Pope, which consists in the approval, by which the decisions first receive an absolute and universal authority. This view seems to be in accord with the historical facts, at least when we read the judgment of the impartial historian, the Anglican Herbert Scott, who wrote in 1928: "It appears that what in the opinion of the Easterns of these centuries [before the Eastern Schism] made a Council to be reckoned ecumenical was ratification and confirmation by the Pope" 3). It is, however, difficult to assume that only the ratification and confirmation of the Pope stamps a council as an "ecumenical". The ratification and confirmation by the Bishop of Rome, even if they take place in forma sollemni, of the decisions of a particular council, do indeed give such decisions a universal force, valid for the entire Church, but do not make such a council itself an ecumenical one. The representation of the entire Church of Christ by the Fathers present is also one of the requirements. The latter is also indicated by the dogmatists in various words as a requirement; for example, Forget speaks of the "assemblée solennelle des évêques de tout l'univers". But then another difficulty immediately arises. What should one think of the words: "the bishops of the whole world", when at the first eight Councils held in the East only four or six or ten from the whole West were present and represented? Or what should one think of the Second General Council at Constantinople in 381, at which not even a single Western bishop was invited, present or represented? Yet another condition is defined by Forget with the words: "pour délibérer et légiférer en commun sur les choses qui intéressent la chrétienté entière". Now, however, it is not immediately obvious what matters are that belong to the interest of the whole of Christendom. In itself, every matter concerning faith or morals is of importance to the whole of Christendom. But not every matter concerning faith or morals calls forth a General Council, nor does it have to do so. The solution, after all, of a question may be urgent for a certain region, where this question is the centre of attention, and thus certainly justify a regional synod, but when that question remains limited within narrower boundaries, a General Council will rightly be absent, even if it concerns faith or morals. Circumstances will have to show whether the integrity of faith and the purity of morals of the whole of Christendom are at stake or only of a smaller group; as is self-evident, it will often be difficult to draw a fixed boundary. How easily different questions are confused may be seen from the following words of Forget: "pour être oecuménique sans restriction aucune, il doit l'être à la fois par sa convocation, sa célébration et la plénitude du pouvoir". This fullness of power is not a constitutive element of a General Council, but an essential consequence, a consequence in particular of the fact that the authorities of the entire Church are present and represented. A Council is not general partly because of the fullness of power, but on the contrary: possesses the fullness of power because of its generality.

The difficult to determine boundary, which according to Forget's definition should be drawn between matters of importance to the entire Christendom and only to a certain part, is no longer fortunately in the definition of a General Council given by a

dogmatist like H. Dieckmann: "est conventus legitimus omnium episcoporum ad deliberandas et decernendas res ecclesiasticas", or a little further "res et quaestiones, quae spectant ad Ecclesiam" 4). When Dieckmann now asks himself in concrete terms what is "required" to be able to call a council ecumenical, he immediately makes a distinction between the quaestio iuris and the quaestio facti. With regard to the General Councils which have already taken place, he acknowledges the existence of a threefold difficulty, namely: the absence of all bishops numerically or physically, the apparent absence of virtually all bishops, necessary for the General Council to be the representation of the universal teaching authority of the Church, and finally the absence of complete agreement among the assembled. In order to resolve the quaestio iuris, Dieckmann follows the prescriptions of canon law 5), firstly with regard to the share of the bishops (can. 223-226), secondly with regard to the share of the Pope (can. 222 and can. 227).

As regards the number of bishops present, it is necessary and sufficient that the assembled bishops represent the entire teaching authority of the Church. Here already Dieckmann is forced to note that a distinction must be made between councils which are general from the beginning and others which, by virtue of their convocation, must rather be called particular councils, but which are later elevated to the dignity of General Council 6). As far as general consent is concerned, the majority of votes are recognized as sufficient for a decision with infallible force.

Passing on to the part of the Bishop of Rome, Dieckmann has much more opportunity to rely on canon law, since this defines the papal functions much more precisely. In the first place, the Pope, and indeed he alone and exclusively, has the right to convene a General Council, in accordance with canon 222, § 1: "Dari nequit Oecumenicum Concilium quod a Romano Pontifice non fuerit convocatum". Here, however, a difficulty arises for us again. Undoubtedly the Pope has the right to convene a General Council, and that exclusively, since He alone is the visible Supreme Head of the entire Church. But it is another matter whether the Pope must always make use of that right, and whether the convocation by the Pope belongs to the necessities, the requirements of a General Council. And this is nevertheless the question which the author wants to solve. Apparently two questions are confused here, although it must be admitted that both are closely related. History also shows that the first eight General Councils were not convened by the Pope, but by the Emperor. Dieckmann does not ignore this and tries to explain these facts by appealing to a development in knowledge about the Primacy and about the rights resulting from it, as well as to the possibility that the Pope has explicitly or tacitly delegated the "right of convocation" to the Emperor, which can happen, for example, by the fact that the Pope recognizes a council convened by the Emperor. Then, however, it seems more correct to speak of a delegation, not as regards the "right of convocation", but as regards the "convocation"; thus one has the right distinction between the right to convene, the jus convocandi, and the actual convening, the convocare, and the above-mentioned confusion of the two issues is avoided. The jus convocandi belongs to the Pope by the nature of the matter, the exercise of that right or better the mere convocare can also be done by others.

In the second place Dieckmann mentions the leadership and the chairmanship as elements that belong to the Pope, in accordance with canon 222, § 2: "Eiusdem Romani Pontificis est Oecumenico Concilio per se vel per alios praeesse, res in eo tractandas ordinemque servandum constituere ac designare, Concilium ipsum transferre, suspendere, dissolvere". All this belongs to the task of the Pope "with the same supreme right". Like the previous, this right also flows from the nature of the matter itself. But here again one may ask whether a distinction should not be made between the right and its exercise.

The third right which belongs to the Pope is the right of confirmation, in accordance with the paragraph of canon 222 just quoted: "Eiusdem Romani Pontificis est... eiusque decreta confirmare". Here Dieckmann notes that "this is the most important right of all." After all, there were councils which were not convened by the Bishop of Rome; others at which he did not preside; but there was never a General Council which would not derive and has not derived its universal authority from the confirmation by the Bishop of Rome 7). Why then in the foregoing speak of the convocation and the leadership as requirements, if these may be lacking if need be? "Requirements" nevertheless evoke the concept of necessity, of essential element, when one treats the requirements as an explanation of a definition. An essential element is something that must be present, if the thing itself is to be present.

That confirmation is an essential element and therefore indispensable, can be beyond doubt; confirmation is equivalent to the vote of the Pope and without the papal vote

one can never speak of a decision taken by the entire Church teaching authority, which is possible if another bishop were to refuse to give his vote. And only when papal confirmation is present and one can therefore speak of a decision of the entire Church teaching authority, will the Council decision have a definitive or infallible force, in accordance with canon 227: "Concilii decreta vim definitivam obligandi non habent, nisi a Romano Pontifice fuerint confirmata et eius iussu promulgata".

That confirmation is indeed the essential element, if not the only essential element among the various possible influences of the Pope, could also be illustrated by Dieckmann's own words concerning the Council of Constantinople 381. The author states that only Eastern bishops were present at this Council; "this synod was only later recognized as ecumenical" 8). A little further on the author explains himself further by writing that some synods were only later elevated to the dignity of ecumenical synod, "such as Constantinople I by the immediately following approval of Pope Damasus and the Western bishops" 9). We find the same thing again when Dieckmann writes that Constantinople I was not ecumenical as regards the convocation, but "later as generally recognized because of the recognition by Pope Damasus and the bishops of the West" 10). However necessary the confirmation of the Pope may be, it seems from the words just quoted that this alone is not sufficient; the ecumenical dignity, indeed, is derived not only from the approval of the Pope, but also from that of the Western bishops; now, these, added to the signature of the Eastern bishops present at that Council, together form the recognition of the entire Church's teaching authority. And this recognition then elevates the Council to an ecumenical one.

To elevate the Council to an ecumenical one. Would it not be more correct to say that this recognition of the entire Church's teaching authority gives infallible force to the decisions and thus makes this Council a Council at which decisions were made which later acquired infallible force? In this context, reference may also be made to the less fortunately chosen terminology of *decretum vere conciliare universale* 11) in the sense of "infallible" Council decision. It would be preferable to speak of *decretum vere conciliare infallibile* or of *decretum vere conciliare universale et itaque infallibile*. The awareness that doctrinal decisions on faith and morals issued by a General Council possess the privilege of infallibility and the naturally associated universally binding force for the entire Church, seems to be so firmly anchored in the Catholic mentality and these conciliar decisions seem to have grown together into such a natural whole with their infallibility that the distinction between the otherwise very closely connected concepts of "ecumenicity" and "infallibility" of a General Council practically fades away. As a result, one comes to use both terms either side by side as two terms of virtually one and the same concept or simply interchangeably. While the "infallibility" of the decisions of a General Council is a consequence of the fact that these decisions were made by a Council that is the representation of the entire Church teaching authority, and is therefore a consequence of "ecumenicity". The treatise has so far been a critical rendering of Dieckmann's exposition, in the following it may be permitted to make some remarks on the method used by the author; this method, which is also the one usually used, can be formulated briefly as a dogmatic exposition based on the data of the *Codex Iuris Canonici*. While a collaboration between scholars of different disciplines is to be welcomed, the way in which in this case the dogmatician relies on the data of canon law seems to us incorrect and also fatal. Incorrect, because the provisions of the *Codex* do not want to indicate anything more than the requirements of and the conditions for a General Council from Pentecost 1918, a regulation of the future and not an assessment of the past. The *Codex* is not a book of dogmatics, nor does it want to be, and it is an incorrect view of the dogmatist when he draws his dogmatic doctrine, which must also be true in the past, from and lets it rest on the *Codex*. There are, however, various canons in the *Codex* that can be indicated, which contain the official formulation of one or another doctrine, have a dogmatic content; here canon law has been taken over from dogmatics. In that case, however, they are dogmatic provisions not because they are in the *Codex*, but because this is evident from elsewhere. It therefore remains the only correct method for the dogmatician to appeal, not to the *Codex*, but to the same source of dogmatics from which the compilers of the *Codex* also drew when adopting a dogmatic provision among the canons. The method is fatal, because it is due to this that the dogmatician in his exposition loses sight of the real question of the "requirements" or "essential elements" of a General Council and starts talking about the "rights" of Pope and Concilium Fathers, in accordance with the terminology of the Code. At the same time, one overlooks the fact that the Code does not mention a distinction between that which is of divine right and that which is only of ecclesiastical right, or between that which

necessarily follows from the nature and essence of the matter and therefore must be present at all times and that which for some external reason has been determined in the past or is determined for the future and therefore does not always have to be true in all General Councils in order to be able to speak of an Ecumenical Council. With regard to the doctrine of the General Councils, various questions can therefore be raised, all of which culminate in the further determination concerning the required "cooperation" of the Pope. And although it is certain on the one hand that the vote or confirmation of the Pope is required in order to be able to speak of a true universal conciliar decision, and on the other hand that doctrinal decisions of an Ecumenical Council on faith and morals possess the privilege of infallibility, the question has not yet been resolved unanimously among dogmatists as to who or what in concrete terms is the bearer of that awesome authority. Are these the pastors, gathered and assembled from all quarters, precisely through their union with the Pope and only insofar as they are united with him, so that ultimately the Pope is the only adequate bearer of infallibility, or do the bishops enjoy the special guidance of the Holy Spirit, who protects them from error and even from the possibility of error, together with the Pope, so that besides the Pope, the universal ecclesiastical teaching authority, in which the Pope is necessarily included, is also the bearer of infallibility. Since the history of the Councils, which are in fact considered ecumenical, offers valuable data showing what is required in order to be able to speak de jure of a General Council 12) and since the history of the tradition surrounding the concept of "General Council" may with equal right claim consultation as a source of valuable data, the aim that is set out below is to conduct a purely historical investigation into the facts and into the views of the fourth century which can shed light on the questions surrounding the concept of "Ecumenical Council". This formulation already implies that this historical research will mainly, although not exclusively, concern itself with the two Councils that are recognized as the only General Councils of this period: the Council of Nicea in 325 and the Council of Constantinople in 381. The facts and opinions concerning other councils or synods are examined, because they too can contribute to a correct explanation. The research therefore opens with an overview of the synods before the year 325, among which not a single General Council was held; a separate chapter is devoted to such important synods as Sardica 343 and Rimini-Seleucia 359. When it comes to questions concerning the concept of "Ecumenical Council", as is self-evident after all that has been said, the focus will be on the questions of ecumenicity, infallibility and the bearer of infallibility. Here the historical research is again concentrated on the question of whether in the 4th century the Pope was considered the subject of infallibility, as Forget 13) and many others assume or whether on the contrary the thesis of F. X. Funk 14) is historically founded! according to which the General Council itself, in other words the assembled bishops together with the Pope, possessed this authority according to the view of that time.

CHAPTER I SYNODS BEFORE THE YEAR 325

Terminology and Nature

A detailed theory of the General Council will not yet be expected from the Church Fathers and ecclesiastical writers of the 4th century, the first century in which General Councils occur. It is therefore necessary to unearth their views on the concept of "General Council" from more or less loose sayings, from indirect indications, from the line of conduct with regard to the General Council and of particular synods, from the various events. Valuable data can also be hidden under the perhaps colorless-seeming terminology that the sources use when they deal with General Councils on the one hand and with particular synods on the other. It is therefore important to investigate the way in which various synods before the year 325, all particular, are described. There is an essential difference between a General Council and a particular council. This is already apparent from the difference in authority. The authority of the first is infallible, that of the second is not. The investigation of the terminology is therefore connected with a sketch of the nature of the particular synods that took place before the first General Council of Nicea in 325.

When one reads through the texts of the already numerous synods before the year 325, the sobriety immediately stands out as a characteristic feature. Not so much as regards the number of texts. For, even if the historian lacks a detailed account of most synods from the early times of the Church and has the authentic Acts of only one of those synods, he can still, with a careful investigation, compile a collection of a respectable number of texts, taken from immediate sources. The sobriety that is

striking is especially that in the terminology. The expressions are of a monotonous sameness, without any embellishment or variation.

When Eusebius of Caesarea writes about the Easter Controversy at the end of the 2nd century: "On this matter there were synods and meetings of bishops, and all
55675 unanimously established by means of letters an ecclesiastical regulation for all the faithful... Even now there is a letter in circulation from those who at that time met in Palestine, under the chairmanship of Theophilus, bishop of the community in Caesarea, and Narcissus, bishop of that in Jerusalem" 1), then he has gathered together almost the entire repertoire of terminology concerning the synods before the
55680 year 325, both the repertoire of the writers before Nicea and those after Nicea. An older witness is Polycrates of Ephesus, who in a letter to Pope Victor also reports on the Easter controversy: "I could also mention the bishops present who requested me to convene it, and whom I did convene; whose names - if I must write them - are of a great number" 2).

This sobriety in terminology applies not only to the less important or almost unknown synods from the earliest times (2nd century), but also to the most well-known, the most important and the often very busy synods from the 3rd and the beginning of the 4th century. St. Cyprian writes in connection with the heretic baptismal controversy over a nefarious one in Cathago, held around the year 220 3), the following": "Our
55690 opinion that those who come from heresy to the Church must be baptized is nothing new and unexpected with us, given the fact that many years and a long time ago under Agrippinus, of last memory, very many bishops have met and established this" 4).

Concerning the Synod of Carthage in April or May 251, as well as a synod in Rome in the same year, the following words flow from the pen of the same Father of the
55695 Church, Cyprian: "According to what had been previously agreed upon, especially when there would be an opportunity to meet together (facultas in unum conveniendi) due to the end of the persecution, we bishops ... have assembled in large numbers ... And if perhaps the number of bishops in Africa is not considered large enough, we have also written to Rome about this matter, to our fellow bishop Cornelius, who himself, after
55700 a council of very many fellow bishops [cum plurimus coepiscopis habito concilio], agreed with us in the same conviction" 5). The synodal letter of Carthage 253, which was written by Cyprian and signed by sixty-six bishops, is entitled: "Cyprian and the other fellow bishops, who were present at the council in the number of sixty-six, to Brother Fidus, greetings); in the letter one can read: "Now concerning the matter of

children, that according to your words they should not be baptized within two or
55705 three days of their birth and that the ancient law of circumcision should be observed, so that according to your opinion no newborn should be baptized and sanctified within eight days: quite different is the view of our council"?) Regarding the heretic baptismal council in Carthage during the spring of the year 256, at which
55710 seventy-one bishops from proconsular Africa and Numidia were present»), the synodal letter to Pope Otephanus writes: "In order to settle certain matters and to examine them thoroughly by common agreement, we have deemed it necessary, dear brother, to convene and hold a council, at which very many priests came together and much was discussed and carried out" 9). From these letters it appears that both Cyprian and
55715 the assembled bishops call their meeting a "council" without further ado. Even more simply in a letter to Pope Lucius: "Cyprian with his fellow bishops to Brother Lucius, hail" 10).

The oldest authentic document of synodal Acts known to us, entitled: Sententiae
55720 episcopomm numero lxxxvii de haeretias baptizandis, which gives an official report of the synod of Carthage on 1 September 256 11), at which no fewer than eighty-five bishops were present 12), states very matter-of-factly that on 1 September several bishops from the provinces of Africa, Numidia and Mauretania had assembled in Carthage with priests and deacons, while a very large part of the people was also present, and after the letter of Jubaianus to Cyprian had been read, as well as that
55725 of Cyprianus to Jubaianus on the baptism of heretics and what the same Jubaianus had subsequently written back to Cyprian, Cyprian spoke ... " 13). Bishop Crescens Cirta appears to be the most elegiac, when he introduces his vote as follows: "After to such a company [tanto coetu] of holy confreres in the Priesthood the letters have been read from our beloved Cyprianus to Jubaianus and to Stephanus 14), which contain
55730 so much in them of holy testimonies of predecessors from divine scriptures, that we all rightly, gathered together [adunati] by Cod's grace, must agree, I give as my vote... 15).

Cyprianus and his fellow fighters speak together in simple words about these
55735 important and, as far as the number of people present, large synods are concerned, Cyprian writes just as simply in his numerous private letters about the other synods in Carthage, which for the area of Africa from the middle of the 11th century seem to

belong to an annual or even semi-annual institution and at which the bishops of three provinces: Africa proconsularis, Numidia and Mauretania, met 16). The contemporary, Bishop Dionysius of Alexandria, writes in a letter to Pope Sixtus about the various heretic baptismal councils: "And consider the weight of the matter. For indeed, as I hear, it has been decided in the largest synods of bishops on this subject, that those who join heresies must first become catechumens, then wash and purify themselves again from the stain of the old and impure leaven" 17).

Later, post-Nicene writers also display a similar simplicity towards these synods. One of the many examples from the Church History of Eusebius opened this series of texts 18). In the case of St. Augustine, too, one must again make a choice from much material, since Augustine repeatedly speaks of the Carthaginian synods in connection with Donatism. Dealing with the heretic baptismal controversy, the bishop of Hippo says: "Indeed, he [Cyprian] says that not one, but two or more councils were held on this question, African ones nonetheless. And he mentions that at one of them there were seventy-one bishops..." 19). Augustine reproaches the Donatists for sowing discord against the intention of Cyprian, to whom they appeal: "What can you say, that you even dare to appeal to Saint Cyprian, as if he, a defender in great measure of Catholic unity and peace, were the author of your schism? Take care [Augustine addresses the Donatist Cresconius] in the first place to be in the Church which, as is certain, Cyprian kept and preached; and only then have the mischief to name Cyprian as the inventor of your conception: first of all imitate the affectionate love and humility of Cyprian, and first come then bring up with the Council of Cyprian 20). Elsewhere Augustine writes: "Let those [the Donatists], by whom unity is assailed by an appeal to this council, listen carefully to how much unity must be loved according to this council 21). Referring to this same Council of Carthage, 1 September 256, at which eighty-five bishops were present, Augustine writes extensively about the gesta concilii, the "acts of the council" 22).

Among the legion of texts about this Carthaginian meeting in his seven books De Baptismo contra Donatistas, the synod is called a "holy council" only once: "I for one believe that the Catholic bishop Cyprian, the Catholic martyr, who, in order to find favor in the eyes of God, – humbled himself in everything according as he was more respected, uttered nothing at all, especially in the holy council of his fellow bishops [in sancto praesertim concilio collegarum], but what he had in his heart" 23). Vincent of Lerin asks: "What authority does this African council or decree possess 24)? In De viris illustribus, Jerome gives the following testimony about Bishop Dionysius of Alexandria: "He agreed with the decision of Cyprian and the African synod about the rebaptism of heretics." 25)

At a synod convened by Pope Cornelius in Rome in the year 251 for the purpose of settling the Novatian question, Eusebius says: "A very large synod was assembled at Rome for this matter, bishops to the number of sixty, and many more priests as well as deacons" 26). Despite the large number of people present and the special importance, since this concerns a Roman synod convened by a Pope, Eusebius does not use any special epitheta ornantia, any more than in the following quotation: "There are still in circulation among us letters from Cornelius, the bishop of Rome, to Fabius, the bishop of the Antiochene Church, which make known the proceedings concerning the Roman synod and the views of all in Italy, Africa and the regions therein" 27). About the same synod Jerome also writes in simple words in De viris illustribus: "Cornelius ... wrote a letter to Fabius, bishop of the Church of Antioch, about the synod at Rome, in Italy and Africa, and another about Novatian and those who have apostatized; a third about the proceedings of the Roman synod" 28). When Bishop Dionysius of Alexandria, in his struggle against the Sabellian heresy, was suspected of preaching the opposite heresy, that the Son was only a creature and not co-existent with the Father, and an accusation was even brought against his namesake Pope Dionysius, this Pope convened a synod in Rome in the year 259 or 260 29). About this the later Athanasius writes: "the synod in Rome expressed its dissatisfaction" 30).

The synodal letter of the synod at Antioch in the year 268 31), at which no fewer than seventy to eighty bishops were present 32), Eusebius introduces with the following words: "With unanimous decision therefore the pastors assembled thereupon wrote [ol èm xauxó auyKEKpoxr|pévoi noipévec;] a letter to the bishop of Rome, Dionysius, and Maximus, the bishop of Alexandria, and sent it around to all the provinces" 33). The address of the synodal letter itself is not more abundant: "To Dionysius and Maximus ... and to the whole Catholic Church under heaven, Helenus and Hymenaeus ... and all the other bishops and priests and deacons, who live with us in neighboring cities and under the ðovt]" 34). In the letter itself it says once: "But while we were together auveXrjXuSóxcov]" 35). Theodoret of Cyrus also says that "they

met at a synod" 36), Athanasius, Basil and bishop Alexander of Alexandria observe the same simplicity 37).

55805 We still have the canons of the council at Elvira (around 300) 38). Without any addition of "holy synod" or anything of the sort, fifty-eight canons of the total number of eighty-one introduce the decision with "it is decided" [placuit] or "it pleases us" [placet]; the other canons lack even this 39). The sources speak no differently about the synod of Alexandria in 306; about the meeting of seventy

55810 Donatist bishops at Carthage in 312; about the synod in the Lateran Palace in Rome from 2 to 4 October 313, convened at the invitation, if not by order, of Constantine I to put an end to the schism in Africa, under the presidency of Pope Miltiades, while in addition three Gallic and fifteen Italian bishops acted as judges, all of whom acquitted Caecilian of Carthage and condemned Donatus of Casae-Nigrae. With this

55815 last-mentioned council, however, the troubles in Africa had not yet ended. The Donatists continued to trouble the emperor with their complaints against Caecilian, and Constantine, irritated, simply referred them to the decision of the Roman synod. In reply, the Donatists indicated that only a few bishops had pronounced their judgment; they also claimed that they had not been sufficiently heard in Rome 40); at

55820 his wits' end 41), Constantine decided that the question should be finally settled at a great meeting of bishops, which he convened on 1 August 314 at Arles 42). One of his letters of invitation 43) has been preserved, addressed to Chrestus, the bishop of Syracuse. After a complaint about the failure of the synod at Rome, because in conflict with the fraternal harmony the discord in Africa continued to exist,

55825 Constantine writes: "Therefore it fell upon me to try, whether that which should have come to an end after the decision already issued by voluntary agreement, could now find a conclusion by a gathering of many. Since we have ordered [ἐκςΧεόααρεν] very many bishops from various and innumerable places to assemble [ουβεΧοειν] in the city of Arles before the 1st of August, we also thought it necessary to write to you,

55830 asking you to go to the aforementioned place before the same day, so that ... you, both by your steadfastness and by the unanimous and unanimous view of the other congressmen [ἐὰν ἄλλοι; Χονχφjq xcbv ουviόvxcov ὁποιjiόxου Καl ὁπόippovoq αυέαεοq], that which has hitherto been frivolously continued in a shameful, mutual strife, may at last be brought back to the due respect in faith as well as to brotherly harmony,

55835 after all the delegates sent by those who are now divided into two parties, whom we have also ordered to appear, have been heard" 44). Constantine rightly speaks in his letter of "very many bishops from innumerable places". There are traditions according to which no fewer than six hundred bishops were gathered in Arles 45). Ellies du Pin 46) however believes that the number should

55840 be limited to thirty-three bishops, because the synodal letter to Pope Sylvester 47) does not mention more in the title and also the persons-list, which is found in various manuscripts, has this number 48). Notwithstanding this relatively limited number of bishops, all the provinces of the empire, under Constantine, were represented at this Council. For besides the thirty-three bishops of the synodal

55845 letter, the list of persons mentions a respectable number of priests and deacons, some as attendants of their bishop, others as representatives and proxies of their absent bishops, so that one can count forty-six, perhaps forty-seven seats. Pope Sylvester is also represented at this Council, according to the signatures of two priests, Claudian and Vitus, as well as by two deacons, Eugenius and Cyriacus 49).

55850 From the fact that the name of Bishop Marinus of Arles appears first in the synodal letter, one may well infer that he held the presidency. With Marinus of Arles there are also: Acratius of Trier, Theodorus of Aquileia, Proterius of Capua, Vocius of Lyon, Caecilianus of Carthage, Reticius of Autun, Ambitatusus of Reims, Merocles of Milan, Adelphius of London, Maternus of Cologne, Liberius of Merida in Spain.

55855 Indeed, the Church provinces of the West: Gaul, Italy, Dalmatia, Africa, Spain and Britain, were present in Arles. The Pope was also represented and if one may fully accept the signature even in an impressive way; a stronger representation than that same Pope Sylvester had at Nicea, where only two priests fulfilled the legateship, stronger also than at the Council of Sardica in 343, where Pope Julius was also

55860 represented by only two priests. Notwithstanding the controversy, the extreme limits of which as far as the number of bishops is concerned are far apart, the number of those present can be called respectable. The Synod of Arles is undoubtedly one of the first really great councils in Church history, if one considers not only the number of those present but also the provinces represented. However, this council cannot be

55865 called ecumenical for the simple reason that the Eastern patriarchates did not participate in it, they had not been invited; they would even have been virtually unaware of the existence of a Donatist question, according to the testimony of Saint Augustine). However, it has been claimed that Saint Augustine considered this synod

55870 to be an ecumenical one, in which case an appeal has been made to his writing *De*
Baptismo contra Donatistas, where he calls Arles a "concilium plenum" 51) and to
his *Epistola xliiii*, where this synod is characterized as a "plenum Ecclesiae
universae concilium" 52). Let it be permitted here to leave aside the question of
55875 whether Augustine has the Synod of Arles in mind in these texts 53) and also of the
question of what is meant in these texts by the expressions *concilium plenum* and
plenum Ecclesiae universae concilium 54); these questions belong to an
investigation of the view of St. Augustine on the Ecumenical Council.
At present it is more interesting whether the contemporaries themselves regarded
Arles as an ecumenical synod. And this is not apparent anywhere. The type of
convocation letters sent around by Constantine can be seen above in his letter to
55880 Chrestus of Syracuse 55). Even though Constantine says that he invited bishops from
various and almost unmentionably many provinces, this expression is also justified
when sending convocation letters only to the numerous bishops of the West between
London and Syracuse, between Cologne and Carthage. Moreover, it is not apparent
anywhere in this letter that Constantine wants an "ecumenical", a "world" synod, a
55885 synod in which also the various, extensive areas of the East would be represented; in
fact they were not present. This is a major difference with the letter of convocation
of Constantine, which concerns Nicea, in which the emperor states as one of the
reasons why he chose Nicea as a meeting place: "so that the bishops from Italy and
the rest of Europe can more easily go there 56); besides the East, the entire West,
55890 the entire Church was invited to participate. The letter of convocation of Arles, on
the contrary, does not speak of the East and from the actual circumstances, among
other things the sole representation of Western bishops, it clearly follows that
Arles was intended as a Western council; but then also a council at which the entire
West had to be present.

55895 Neither do the two synodal letters 57) to Pope Sylvester give any indication that
Arles was considered ecumenical by contemporaries. The opening of the shorter synodal
letter does not differ from that of the synodal letters of earlier councils; it reads
very simply: "To the much beloved Pope Silvester, Marinus, Acratius, ... Epictetus,
eternal salvation in the Lord" 58). And then the letter continues: "Bound together by
55900 the common bond of love and by the unity of the mother, the Catholic Church, we have
been led [adducti] by the command of the most pious emperor to the city of Arles, and
from there we greet you, glorious Pope, with the respect due ... And if you, most
beloved brother, had considered it of such great importance to be present at this
most glorious spectacle, then we certainly believe that a stricter judgment would
55905 have been pronounced against them [the Donatists]; while our assembly [coetus noster]
would have rejoiced with still greater joy, if You had spoken rightly with us... and
since we have come together from different provinces [cum diversae sint provinciae ex
quibus advenimus], there are accordingly also different matters, which according to
our judgment must be considered. In the presence of the Holy Spirit and His Angels,
55910 it has pleased us [placuit ergo, praesente Spiritu Sancto et angelis eius] to bring
forward for judgment, from the matters which greatly interested each one separately,
those which deal with the present peace. It has also pleased everything to You, who
have the greatest dioceses governs, to write and especially to make known to all by
you. As for our opinion, we have added it to the writing of our lowliness [scripto
55915 nostrae mediocritatis]" 59). The fact that the "jubilant" bishops use the solemn
terms of "such a glorious spectacle", "in the presence of the Holy Spirit and His
Angels", does indicate the awareness of the special character of this council, as the
first council at which the entire West is present.

The second synodal letter to Pope Silvester, which literally and exclusively contains
55920 the canons and addresses the Pope only in the preamble and the first canon, begins as
follows: "To the most holy brother, Mr. Silvester, Marinus or the assembly of
bishops, who were together in the place of Arles. What we have decided in common
decision [Quid decrevimus communi consilio], we make known to you, beloved, so that
all may know what they have to do in the future" 60). In the twenty-two canons of
55925 Arles, added to this letter, "placuit" is always used without more, for example in
the third canon: "De his qui arma proiciunt in pace, placuit abstinere eos a
communione" 61). At the end of the first-quoted synodal letter, the contents of the
canons are briefly stated and there too, placuit is used without more. The synodal
letter of Nicea I will sound more resonant with its "the holy synod", "the great and
55930 holy synod" 62) and six canons of the twenty, also with their "the great and holy
synod" 63). Also the letter by Constantine after the Council of Arles to the bishops,
in which the emperor complains about the heretics, who had appealed to the emperor's
judgment, while the judgment of the priests had to be considered as from God himself:
sacerdotum iudicium ita debet haberi, ac si ipse Dominus residens iudicet, this

letter also contains nothing special 64). How completely different is Constantine's ardent conviction expressed in his letter after the Council of Nicea written to various Churches 65)!

From the foregoing the conclusion may be drawn that the Council of Arles was indeed an important council and was also regarded as such by contemporaries, but that there is no question of a "world synod", a General Council with its characteristic features, not even in the thinking of contemporaries. When the Church could breathe freely after the death of Maximinus in the summer of the year 313, at the same time as the Council of Arles, several "assemblies of bishops" also took place in the East 66). One of the first and best known is the Council of Ancyra, the capital of Galatia, held between Easter and Pentecost in the year 314 67), at which eighteen bishops from almost all the Asian provinces were present. The canons of this council have been preserved both in Greek text and in various old Latin translations 68). While two codices bear the heading: "Canons of the Synod of Ancyra" 69), the best Greek manuscripts bear the following heading: "Canons of the Blessed Fathers, who met at Ancyra: which, however, are of an older date than the canons promulgated at Nicea, but are second in rank because of the authority of the ecumenical synod" 70). These canons also always have very simply: "it has pleased" or: "it pleases" [sokel or bet] 71). In the sixth canon we read: "As for those who ... have now joined on the occasion of the synod ... it has pleased ... If there are, however, those who have been admitted to penance before this synod ..." 72).

It is therefore very striking that in these twenty-five canons there is only one mention of "the holy synod [q ayia aóvoöoc;] and the most remarkable and strange, not to say inexplicable thing, is that this represents the first and only case before Nicea. In the seventeenth canon it is stated: "Those who have lived as if without reason [i.e. have committed the sin of bestiality] and have become unclean [leper] and have made others unclean [leper], must, according to the decree of the holy synod, pray under the xei-Pa^oPévoucl" 73). In vain will one look for an explanation of this fact in commentators such as Balsamom, Zonaras and Aristenus, or also Beveridge 74); it does not even seem to have occurred to them, because none of them draws attention to this remarkable fact. Nor does Hefele-Leclercq, who, especially in the French edition of Leclercq, always draws attention to all kinds of small details, always relying on an extensive literature 75). One also searches in vain with X. Le Bachelet, while he draws attention specifically to this canon because of the term "Xeipa^oPévous" 76). The same applies to the extensive Baronius 77). The canon collection of Isidorus Mercator does not speak of "the holy synod", but simply gives placuit, "it has been pleased" or "it has been decided" 78), as does the Prisca versio 79). That of Dionysius Exiguus, on the other hand, has "the holy synod, [q ayia aóvoöoc; sancta synodus 80), as well as the reading in Ceillier, who, however, in his commentary pays no attention to this peculiarity 81). Constantinus Harmenopulus has rendered the text freely: "'O aXoyeuoapEvoc;, Kal Xeitpot; &>v, r) XeTtpcáoag, év Totq euxeóßco" 82), Tillemont does not point this out either 83), nor does Van Espen in his extensive commentary on this canon 84). It is of course possible that the Synod of Ancyra used the term "the holy synod" for the first time in history; it seems more likely to us, however, that this synod, like all its predecessors and entirely in accordance with its own terminology in the sixth canon 85), also spoke simply of "the synod" or even of "it has pleased" in its seventeenth canon. The presently occurring "fj ayia auvobog" would then have to be regarded as a later addition either of the word "ayia" or of the entire expression "fj ayia auvobog"; This addition is quite understandable if one takes into account the fact that the canons of this synod have not been preserved separately, but only in council collections which were compiled after the General Council of Nicea and in which this latter Council always occupied the first place 86); the compiler or copyist of these collections could very well, consciously or unconsciously, have inserted this terminology into the seventeenth canon of Ancyra, under the influence of the preceding canons of Nicea, in which reference is made several times to "the holy synod", as well as under the influence of the fact that after Nicea the terminology "the holy synod" became more and more common also for smaller, particular synods. Going further, one can posit the possibility that there were old Greek manuscripts of these council collections in which the collector left the original "fj ouvo&oq" or, other Greek manuscripts in which the collector used "fj ayia aóvoboc;", which explains why the two oldest Latin translations, the versio Isidoriana and the versio Prisca, have simply "it has been decided", the other manuscripts of the Latin translations "the holy synod". The synod at Neo-Caesarea, the capital of the Pontus Polemoniacus, held a little later than that of Ancyra, provides no material for this

investigation in its fifteen canons; even the otherwise so common "it has pleased", "ἐβόη,ε" does not occur.

Meanwhile, with the rise of Arianism, the eve of Nicaea is approaching. Already around 323 87) Arius was condemned by a great synod in Alexandria, at which about a hundred bishops from Egypt and Libya were present, convened by the Alexandrian bishop Alexander. After this synod Alexander sent a letter to numerous bishops 88), in which the head of the Alexandrian Church wrote: "Since the followers of Arius asserted this... we met with the bishops of Egypt and Libya, almost a hundred in number, and pronounced condemnation against them" 89). And in a letter to his namesake, Alexander of Constantinopel, one can read: "We have therefore unanimously [uapijitjtpei] expelled them from the Church, which reveres the divinity of Christ" 90). In the same letter the request is made not to admit "these people, condemned by the brotherhood" 91) into communion. Still further Alexander speaks simply of "our fellow servants" 92) and indicates that letters were sent in all directions to all Egypt and Thebais, to Libya and the Pentapolis, to Syria, Lycia and Pamphylia, to Asia, Cappadocia and neighbouring regions. Later writers speak of this synod in a similar manner. Thus the historian Socrates: "Hearing and seeing these events, Alexander was enraged; and after he had called a synod [ouvebpiov] of many bishops, he condemned Arius and those who adhered to his doctrine" 93). The historian Sozomenus uses such terms as: "he [Alexander] sat down as judge with the clerics" 94); "after another synod had been held" 95). St. Epiphanius states in his catalogue of heretics: "This [Arius] reached his zenith in the time of the holy bishop Alexander, the successor of Peter, who sent this Arius amid much commotion and condemned by means of a great synod" 96). In very general terms this synod is indicated by St. Athanasius as follows: "The Arians, who were expelled for impiety by Alexander, of blessed memory, the former bishop of Alexandria" 97). Elsewhere this Church Father says: "These [Arians] were declared heretics thirty-six years ago" 98). Sozomenus also speaks of a synod in Bithynia, held by the followers of Arius. "And when they had assembled a synod in Bithynia, they wrote everywhere to the bishops to hold fellowship with the followers of Arius as orthodox believers and to bring about that Alexander also should enter into fellowship with them" 99). A similar synod must also have been held at Caesarea in Palestine 100). Probably in the year 324 another synod was held in Alexandria, at which Ossius of Cordova 101), who had already reached the age of sixty-seven, must have been present. At this synod the priest Colluthus, who claimed for himself the power to administer Holy Orders, was deposed. 102) In his Apologia contra Arianos Athanasius includes a letter from priests and deacons from Mareotis, in which it is written: "But behold, because he [Colluthus] assumed such a title, he was deposed from his [priestly] office at the synod assembled in Alexandria, in the presence of our Father Ossius" 103). Much later Patriarch Photius testifies: "[Philostorgius says] that before the synod of Nicea Alexander, the bishop of Alexandria, came to Nicomedia and found Ossius of Cordova with the bishops present with him and with synodal votes he worked on the Son "to confess to the Father and also to expel Arius" 104). The entire terminology with regard to the particular synods before Nicea, taken together, shows such colorless expressions as convenire in unum, coire, cogere et celebrare concilium, advenire, adunati, concilium, synodus, coetus noster, visum est, placuit, statuere, οὐκ ὀρθόδοξοι, περὶ τῶν ἁγίων, αὐτοκαταλείπει, οὐκ ἐκ τῆς ἐκκλησίας, ἀνόμοιοι, ἀνόμιμοι, οὐκ ἐκ τῆς ἐκκλησίας, ἀνόμοιοι, ἀνόμιμοι. Special epitheta ornantia are completely absent, with one exception: the seventeenth canon of the council at Ancyra in the year 314 with its "the holy synod" 105).

If one now asks for the reasons why these meetings of bishops were held in the various church provinces, Tertullian gives the first answer: "Moreover, in the Greek countries in certain places councils are held from all the churches, whereby both the more important matters are dealt with in common and the representation of everything that is called Christian is celebrated in a venerable manner. And how right it is to gather together under the good omen of faith from all sides around Christ! See, how good and pleasant it is when brothers are united together [Ps. CXXXII, 1]; you can perhaps only sing this text when you are eating a good meal with more people. These meetings, however, first devote themselves to the stations and other fasts and thus know how to mourn with the mourners and then to rejoice with those who rejoice" 106). The seriousness and importance of the issues caused the bishops to meet to consult together. The Church was faced with such a matter when, under the pressure of persecution, many had renounced their faith and wished to be received back into the ecclesiastical community in more peaceful times. This was a burning problem, especially in Africa in the middle of the 11th century, not in one or another diocese, but in all three provinces: Africa proconsularis, Numidia and Mauretania.

The Primas Africae, St. Cyprian, did not feel responsible, if he were to decide alone and on the question of the lapsi; he considered himself obliged to call together his fellow bishops for this purpose in order to make a joint decision. On the occasion of the synod held at Carthage in the spring of the year 251, he wrote to Bishop Antonian: "It was necessary to write to you about this now, so that you would know, that I have acted nothing frivolously, but, entirely in accordance with the position previously expressed in my letters, have referred everything to the common decision of our council and that I had not had any intercourse with any of the lapsi beforehand, when there was still an opportunity to receive not only forgiveness, but even the crown. Afterwards, however, as the agreement with my fellow bishops and the interest of uniting our brothers and healing the wound required, I yielded to the circumstances of the time and I thought I had to provide for the salvation of many. And now I do not deviate from what was once decided in our council by common agreement" 107). A judgment of several bishops will be more mature and correct and therefore carry more weight. Before the Council of Carthage, held on the fifteenth of May 252, Cyprian reported to a number of bishops who had asked him for advice about three who had fallen through weakness: "Since you have written to me to discuss this matter thoroughly with several fellow bishops and because such an important matter requires a more extensive deliberation, one that is of greater importance because many seek their cooperation... I will discuss this more deeply with each of them" 108).

In this way the bishops were able to form their own Church-province through the surf. Accordingly, Pope Cornelius received a letter from Africa, in which he read: "For since it has been determined by all of us, as is just and just, that the cause of each should be heard there, where the fault has been committed, and to each shepherd a portion of the flock has been entrusted, which each has to govern and guide, while he must render an account to God of his actions, those over whom we are appointed should not seek refuge hither and thither, nor seek to break the concord of the bishops by their crafty and lying recklessness, but should plead their cause there, wherever they may find accusers and witnesses of their crime." 109) It was therefore not from fear of lack of jurisdiction that two Spanish Churches 110) turned to Africa to express their opinion on the matter of the apostate Spanish bishops, Basilides and Martialis; but they did this, according to Cyprian, in order to receive comfort and reinforcement, which would be especially welcome to them, because Basilides and Martial had already taken refuge in Rome with Pope Stephen, whom they had succeeded in winning over. And in the same way the council at Carthage, autumn 254, did not think of examining this question again, completely independently. The synodal letter, written by Cyprian and co-signed by thirty-six other bishops, contains the following words: "You [the two Spanish Churches] have expressed the wish that you would receive an answer on this matter and that your justified and at the same time necessary concern would be relieved either by the comfort or by the help of our judgment. But your request already contains the answer not so much in our advice, as in the divine precepts" 111).

There have been several councils in Africa that have dealt with the heretic baptismal controversy. This question belonged to the "more important matters" mentioned by Tertullian, on which a common deliberation was to be held. That this was the prevailing view is evident not only from the fact of these heretical baptismal councils, but also from the words of a synodal letter signed by seventy-one bishops to Pope Stephen of the synod held at Carthage in the spring of 256: "In order to regulate certain matters and to examine them thoroughly by common consultation, we have deemed it necessary, dear brother, to convene and hold a council, at which a great many priests came together" 112). The baptism of heretics is emphasized in the remainder of the letter and is the only point of discussion; the members of the council express their opinion that they must communicate their decision on this matter to the Pope. Dionysius of Alexandria also judges the heretical baptismal controversy to be a matter of great importance and supports this opinion by appealing to the fact that great heretical baptismal councils have been held. He writes to Pope Xistus: "And note the weight of the matter. Indeed, because decisions have been made on this subject at the greatest synods of bishops" 113).

In addition to the numerous councils, especially in Africa, on lapsi and heretical baptism, there have been others that had as their subject the Easter controversy, heretical or at least very dangerous opinions such as those of Origen, Privatus, Beryllus of Bostra, the hypnopsychites, the Millenarians, Paul of Samosate, Meletius of Lycopolis, the Donatists and Arius and his followers; even bishop Dionysius of Alexandria was accused of heresy in the Logos doctrine in Rome and asked by a synod

- for a written explanation. Schismatics such as Felicissimus, Novatianus, Nepos were condemned at councils. In Africa, at a synod in the early 11th century, the question was discussed whether clerics were allowed to take on the task of tutor or curator testamenti, which was answered in the negative and this prohibition was tightened up again at the council of Carthage in 249. The agenda of the synod in Alexandria in 324 included the celebration of Easter, the Meletian schism and the condemnation of Colluthus.
- During this period, then, synods were held at Rome, in Africa, at Alexandria, in Arabia, in Palestine, Achaia, Cilicia and Phrygia, Galatia and Cappadocia, in Spain and Gaul, synods at which bishops, either from the same province or from different neighbouring provinces, came together to deliberate on ecclesiastical interests, which were of various kinds, very important ones like heretical baptism and less important ones like tutorship, interests in the doctrinal and disciplinary fields, and to judge various persons, priests like Origen and Colluthus and also bishops like Privatus of Lambesia, Paul of Samosate and the orthodox Dionysius of Alexandria 114).
- Striking is the often repeated expression of the ultimate agreement of the assembled bishops. How often does Cyprian point out that the decisions were made "unanimously"! In the footsteps one encounters in the sources: omnes uno consensu, de consensu communi, quid decrevimus communi consilio, de communi conlatione, universi iudicavimus, $\rho\delta\iota\ \Upsilon\upsilon<\eta\pi\beta>\ \acute{\epsilon}\nu\ \text{KOivfjq yvcbpqc}$;, $\text{blo}\epsilon\ \acute{\epsilon}\rho\iota\text{ijjoyoo}\ \text{K}\acute{\alpha}\lambda\ \acute{\omicron}\text{pcxppovoc}$; $\alpha\upsilon\upsilon\acute{\epsilon}\alpha\epsilon\text{ocoq},\ \alpha\acute{\omicron}\text{ptpcovov}\ \text{qj}\text{rjcpov}\ \acute{\epsilon}\lambda\text{,eveyK}\acute{\omicron}\text{VTEq}$.
- Once the bishops had jointly determined their position and made their decisions [decreta or placita], then these pronouncements possessed authority [decreti nostri auctoritas] and the force of law, which was also the case for pronouncements made by predecessors [ab antecessoribus nostris statutam sententiam] 115). The bishops were also subject to the decisions which they themselves had made jointly. Does not Cyprian say that he and his fellow bishops were deeply indignant when they heard that Bishop Geminius Victor, on his deathbed, had appointed the priest Geminius Faustinus as executor of his will, "while it had already been decided earlier at a council of bishops that no one should appoint any of the clerics or servants in God's House as tutor or curator for his estate" 116)? Therefore, for this bishop, who acted "against the norm recently established by priests in a council," no Holy Mass may be offered or publicly prayed in the Church, "so that the decision of the priests may be observed by us." 117)? And the sixty-six bishops at the council of Carthage in 253 reproached Therapius, Bishop of Bulla, for having reconciled one of his priests, named Victor, with the Church without demanding sufficient penance; this meant a violation of the rule established by the council of 251: "And this grieves us deeply, that the authority of our decision has been set aside" 118). Regarding the action taken with regard to the already mentioned Spanish bishops, Basilides and Martialis 119), the synodal letter of 254 writes that such people cannot stand at the head of Christ's Church nor may they offer the Holy Sacrifice of the Mass "especially since our fellow bishop Cornelius has already previously decided with us and with literally all the bishops throughout the world that such people may indeed be admitted to penance, but must be kept away from ordination as clerics and from the priestly office" 120). Dionysius of Alexandria does not want to detract from the decisions on heretical baptism that were taken at so many councils, for example in Iconia and Synnada 121). Apparently, the Egyptian bishop Meletius, who was deposed at a synod in Alexandria at the beginning of the 4th century for various crimes, also considered the pronouncement to be of such force that he did not seek it from another authority, but simply renounced obedience, so that Athanasius could later testify: "Meletius, however, did not have recourse to another synod, nor did he endeavor to defend himself for posterity; he caused a schism" 122). The Council of Arles, which expressed its regret that the Pope had not been present 123), made its decision known "so that all would know what they must observe and observe in the future" 124). Nevertheless, people were convinced that the pronouncements of particular synods were not decisions that could no longer be changed: infallibility, an absolute, always and everywhere valid force, cannot be attributed to them. Is this already indirectly evident from the fact that on exactly the same subject, on which a decision had already been made, a council was held several times without protest and in different parts of the world and even in the same ecclesiastical province 125), this can be demonstrated very clearly and directly from the words spoken by Cyprian on September 1, 256, in the presence of more than eighty bishops at the opening of the third council held by him on the baptism of heretics. "You have heard, most beloved colleagues, what our fellow bishop Jubaianus has written to me to consult our lowliness about the illicit and unholy baptism of heretics and what I have written

back to him, namely my judgment that we have already pronounced once and again and often: that the heretics who wish to be received into the Church must be baptized and sanctified with the baptism of the Church ... '. It now remains for each of us to express our opinion on this matter separately, not pronouncing judgment or condemnation on anyone or denying the right of community to anyone if he is of a different opinion" 126). Although the question had already been decided several times and the decision taken several times had the force of law, the matter was once again dealt with in its entirety and every bishop present was still free to maintain whatever he thought fit concerning the validity of heretical baptism, so that any possible proponent of the validity, in deviation from the previous decisions, would not incur excommunication 127). A position that cannot be reconciled with an infallible pronouncement. About the synod at Carthage in the spring of the year 251, at which the attitude towards the lapsi was determined, Cyprian wrote in a later circular: "And if the number of bishops in Africa is perhaps not considered large enough, we have also written to Rome about this matter, to our fellow bishop Cornelius" 128); at the council at Rome in the autumn of the year 251, the Pope agreed with the decision of the African synod. A decision of a particular synod, even if it had the force of law, was still subject to further scrutiny.

CHAPTER II THE FIRST GENERAL COUNCIL AT NICEA IN 325

It is difficult to determine who or to whom the initiative for the first General Council belonged. If a synodal letter in Syriac is indeed a translation of an authentic document, a synod must have been held in Antioch in the winter of 324 to 325 1). Fifty-six bishops 2) from Palestine, Arabia, Phoenicia, Coelesyria, Cilicia and Cappadocia were assembled under the chairmanship of Eusebius of Isauria. They had to choose a new bishop for Antioch, since Philogonius had died on 24 December 324; their choice fell on Eustathius, bishop of neighbouring Beroea and kindred spirit of Alexander of Alexandria. The opportunity was also used to condemn the heresy of Arius and to make a confession of the true faith. Three of those present, Theodotus of Laodicea, Narcissus of Neronias, and Eusebius of Caesarea in Palestine, refused to sign the formula; the synod excluded them from the community, although not definitively, since they were given time and opportunity to come to their senses. A synodal letter was sent in all directions, especially to the "bishops of Italy, who belonged to the See of the great Rome". These Western bishops sent back a letter approving the decree of faith of Antioch 3). The phrase from the synodal letter, in which the provisional character of the excommunication of the three bishops is expressed, reads as follows: "And you must also know this, that because of the great brotherly love of the synod we have given these persons time to repent and to acknowledge the truth until the great synod of priests at Ancyra" 4). Based on this information, some have thought that the proposal for a General Council originated with the Fathers of the Antiochene synods 5). However, from the text just quoted one can read no more than that already at the end of the year 324 the plan was known to hold a General Council at Ancyra 6) because of the Arian doctrines and that the invitations had most probably already been sent and received by the Eastern bishops; however, this synodal letter says nothing about the initiative. According to Sulpicius Severus, Ossius of Cordova is the author of the Nicene Council 7). Philostorgius seems to regard Alexander of Alexandria as the main driving force, in collaboration with Ossius and other bishops 8).

Usually, however, the initiative is attributed to Emperor Constantine; the emperor as initiator is also the representation given by the eyewitness and oldest church historian, Eusebius. He writes: "Thereupon he [the emperor], as if taking the field against him [Arius] with a phalanx of God, assembled an ecumenical synod by urging the bishops of all regions with honorable letters to hasten" 9). However, one must not lose sight of the fact that Eusebius in this writing, *De Vita Constantini*, is not primarily a historian but a panegyrist; for the eulogist there is a real danger of exaggeration, which is why it is very possible that Eusebius was the great and the of course, for the world more conspicuous part of Constantine has made into an exclusive role.

A combination of the different reports perhaps brings us closest to the actual course of events. The situation indeed threatened to become serious. The heresy of Arius was in itself devastating for Christianity: it denied after all one of the fundamental principles of Christianity, the true Godhead of Christ. Moreover, Arianism meant a rationalization of faith, the battle waged by pure reason against the spirit of faith 10), the battle of a mentality, entangled in the remains of pagan views against the pure Christian mentality. Several bishops, priests and believers had already been affected by this pernicious tendency and heretical doctrine and despite a

56265 condemnation at the Council of Alexandria, a particular synod, the evil continued to
 proliferate. In addition to this danger to the true religion, there was a danger to
 the State. Recently, since the death of Licinius in 324, the unity of the Empire had
 been restored and order and peace could enter under the sole rule of Constantine, who
 56270 was well-disposed towards the Christians. Now, however, the danger of a conflict of
 faith, of sharp religious disputes threatened; unity in the Church would be over.
 With that, the newly acquired unity, peace and order in the State would also come to
 an end. Under these circumstances, both the ecclesiastical authorities and the head
 of State had to feel drawn to take energetic measures to exorcise the evil spirits.
 The appropriate, already existing means was: a council of bishops. Was it not
 56275 obvious, after the failure of the particular synod in Alexandria, and now that unity
 in the entire Church and the entire State was at stake, to convene a meeting of the
 bishops from the entire Church and the entire State, a world meeting or "ecumenical"
 synod? For the first time in the history of the Church, external circumstances made
 such a meeting possible. Moreover, a world meeting would not only be the only
 56280 effective measure, but also a solemn manifestation of the unity so much desired by
 the emperor and the bishops. The idea of such a world meeting must therefore have
 hung in the air, as it were, in the given circumstances, and must have occurred
 spontaneously to several people. 11). In a personal contact between the emperor and
 Ossius of Cordova, between Ossius and Alexander of Alexandria, between these persons
 56285 and other bishops, who were all disappointed in the more private attempts, it is
 therefore quite natural that the desirability and the possibility of a world meeting
 were discussed on both sides. The initiative is then not to be attributed to one
 person, but to the spontaneous, common idea of all of them who were involved in the
 fight against the Arian heresy and focused on the unity of Church and State; in the
 56290 first place one thinks of Ossius, Alexander and Constantine. The transformation of
 the idea into action, of the initiative into reality, must be attributed to the only
 person who was practically able to bring together the bishops of the entire world:
 the emperor; hence the panegyrist Eusebius was tempted to mention only Constantine,
 so that one gets the impression that everything originated from the emperor alone.
 56295 However, the emperor brought the Council together after and as a result of the
 exchange of ideas with leading figures in the Church; probably Ossius, who had a
 personal interview with the emperor in the year 324 and was sent to Alexandria with
 an imperial letter on the Arian question, was Constantine's principal adviser, so
 that Sulpicius Severus was allowed to mention Ossius in particular as the arranger of
 56300 the General Council; the text of Sulpicius Severus must not be interpreted in the
 sense that Ossius was the sole arranger. Philostorgius rightly mentions a third
 leading figure, namely Alexander of Alexandria; insofar as Philostorgius makes it
 clear that Alexander collaborated with other persons, he represents the actual
 situation more accurately than the other sources.
 56305 That Ancyra was indeed originally determined as the meeting place, is evident from
 the convocation letter of Emperor Constantine. This letter has been preserved in the
 oldest Syriac version of the Nicene canons, by Marouta, bishop of Maipherkat,
 produced at the instigation of the Patriarch Isaac of Seleucia-Ctesiphon (4th
 century). After this letter is announced with the words: "Letter of Emperor
 56310 Constantine to the sixty bishops", the text follows: "It is, I think, known to all,
 that nothing is so dear to my heart as piety towards God. Although at first I thought
 it good to convene a synod of bishops in the city of Ancyra in Galatia, it has now
 appeared to me for many reasons more expedient to convene the synod in the city of
 Nicea in Bithynia 12), and so that the bishops from Italy and the rest of Europe can
 56315 more easily go there, and because the weather there is milder and healthier, and so
 that I myself can be present and take part in the proceedings. And therefore, dear
 brethren, I communicate to you as my will, that all shall meet as soon as possible in
 the aforesaid city, namely Nicea. Every one of you, taking into account the great
 interest, may hasten, as has been said, to come without delay, to take part in the
 56320 discussions in person. May God protect you, dearly beloved brethren" 13).

This letter of convocation shows that it was Emperor Constantine who called the first
 General Council of Nicea, and he alone. Constantine apparently acted on his own
 authority and regarded the convocation as a matter which was rightfully his as
 56325 basileus and on which he decided independently. The empress does not let the idea
 even hint in her letter that the approval or action on the orders of a second and in
 particular of the Bishop of Rome would in fact be present or required. The other
 initiators such as Ossius and Alexander of Alexandria are not even mentioned; they
 may have suggested the idea of the desirability of a general synod, but the
 56330 convocation of such a synod belongs to the emperor and is not done on the orders of

others 14).

Various other statements by Emperor Constantine about the Council of Nicea reflect the same train of thought. In his speech to the synod Constantine says: when I heard of the ecclesiastical discord, I thought I should attend to this matter; I also wished to use my resources and therefore "I called them all together without delay" 15). In a letter to the Alexandrian Church Constantine also writes that he called the synod at Nicea "by the inspiration of God" 16); even here the emperor does not speak of the cooperation or consent of the Bishop of Rome, any more than in his circular letter to the Churches 17) and in his later letter to the Church of Nicomedia 18).

The Council itself also knows nothing else than that it was brought together by the grace of God and the care of the basileus, beloved of God, Constantine 19).

Constantine's contemporary Eusebius of Caesarea bears witness to the same view when he simply mentions that the emperor called an Ecumenical Synod 20). In the same way, the later historian Socrates says that the emperor "called together an ecumenical synod, inviting the bishops of all regions by letters to meet at Nicea of Bithynia" 21). The same can be found in Sozomenus 22), Theodoret 23) and in the continuation of the Eusebian Church History by Rufinus 24). According to the latter historian, the emperor convenes the assembly "at the wish of the priests" *ex sacerdotum sententia*. Who these priests, or rather bishops, are, Rufinus does not mention. But here one feels compelled to think especially of Ossius and Alexander of Alexandria, whose desire for the definitive means of a General Council has already been demonstrated. If the historical circumstances preceding Nicea already give the legitimate

presumption that Rufinus means Alexander and Ossius with the expression *ex sententia sacerdotum*, written not before the year 403, this presumption becomes certain when one reads the testimonies of Epiphanius and Sulpicius Severus. In the years 374-377 Epiphanius already wrote: "But soon Constantine, of blessed memory, assembled a synod in the city of Nicea at the zealous urging of Alexander, the holy bishop of Alexandria" 25). At the same time as Rufinus, Sulpicius Severus wrote in his

Chronicles that Ossius was the author of the Nicene Council, which means that it must be meant that Ossius belonged to the *auctores intellectuales* 26). That Pope Silvester would also have been included among those "sacerdotes" is not apparent anywhere and is very unlikely, since Constantine convened the Council during his stay in the East and the Pope would not have followed him there. Moreover, if Pope Silvester were indeed among the number of bishops at whose request Constantine convened the Council, the silence of all sources about this special advisor becomes puzzling and inexplicable. However, even if one wants to see the Pope included in Rufinus' words, the text is still not conclusive for the recognition of a papal right of approval. Rufinus only speaks of "wish", not of approval; and then about different bishops, not about the Pope alone, which would have to be the case if one wants to read the recognition of the papal right of approval into the text. From all these testimonies it appears that the emperor and this one alone convened the General Council of Nicea, and that the time-notes granted the emperor the right of convening. If one had been convinced that the Pope had to grant the emperor full authority to do so and the granting of this authority consisted in approval and if the emperor had also acted accordingly with the approval of the Bishop of Rome, then this cooperation of the Pope could not always have been completely passed over by the various sources in a way that suggests the very opposite 27).

Because the various reports do not agree, it is difficult or impossible to determine the exact number of participants. The eyewitness Eusebius of Caesarea counts more than two hundred and fifty bishops, while according to him the number of priests, deacons and acolytes who accompanied their bishops was almost innumerable 28). Saint Eustathius of Antioch, who was also present at the Council, speaks of about two hundred and seventy-eight bishops 29). Another participant, Saint Athanasius, repeatedly gives the number as three hundred bishops or about three hundred 30). In *De synodis seu de fide Orientalium* of Saint Hilary of Poitiers, written in the year 359 shortly before the synods of Rimini and Seleucia, the well-known number of three hundred and eighteen is found for the first time; this number then signifies for Hilary a sacred and symbolic number as being the number of servants of the conqueror Abraham (Gen., XIV, 14) 31). From that time on this symbolic number is held on to. Hilary himself repeats this figure in his *Liber contra Constantium Imperatorem*, written in the year 360 32). His example is now also followed by Athanasius in his *Epistola ad Afros episcopos* of the year 369 33). Three hundred and eighteen is also the number given by Pope Liberius 34), Pope Damasus 35), Epiphanius 36), Hieronymus 37), Rufinus 38), and as a symbolic number especially by Ambrose 39). The later historians Socrates 40) and Theodoret 41) adopt this number; only Sozomenus still

speaks of about three hundred and twenty bishops 42).

People came together at Nicea from all sides. Eusebius describes this in the following way; "From all the Churches now, which filled all of Europe, Libya and Asia, the flower of God's servants came together. A single house of prayer, as if enlarged by divine power, offered room within its walls for Syrians as well as Cilicians, Phoenicians and Arabs, for Palestinians and also for those from Egypt, from Thebais and Libya and for those who came from Mesopotamia. A bishop from Persia was present at the synod, and Scythia was not lacking in this company; Pontus and Galatia, Pamphylia, Cappadocia and Asia and Phrygia had their elite among those present; and also Thracians and Macedonians, Achaeans and Epirotes, and among them those who lived the furthest away had come; even from Spain the much-vaunted one came together with many others to sit with the words: "the head of the imperial city [Rome] however was absent because of old age, but his priests were present to take his place" 43).

The Eastern part of the Empire formed by far the majority at this Council; almost all the bishops were Eastern bishops: Egypt, Palestine, Coelesyria, Asia Minor counted many bishops among those present. The Greek regions of Europe, notably Thrace, Thessaly, Macedonia, Dardania and Achaia had some representatives: of Moesia and Dacia only two bishops' names are known.

But nevertheless the large ecclesiastical areas of the West were also represented. North Africa was present in the person of the bishop of Carthage, Caecilian; Calabria was also represented by one bishop, Marcus graced; Milan by its bishop Eustorgius 44); Gaul by the bishop of Die, Nicasius 5); Ossius of Cordova represented Spain; the bishop of Rome was personally represented by two Roman priests, Vito and Vincentius. Only of Britain no representative is known. From the shores of the Black Sea came the bishop of Pityus in the Caucasus, that of the Bosporus, and two from Great Armenia; Persia had one bishop at the Council of Nicaea 46). In spite of the Eastern majority, one may therefore say that the whole Church and all parts of the Church at this Council in the history of the Church, which indeed embraced the whole Catholic world. The Fathers present showed understandable differences in nature and disposition. Some were skilled in theological difficulties and mutual arguments; for Eustathius of Antioch, Eusebius of Nicomedia, Alexander of Alexandria or Marcellus of Ancyra, who at this Council was one of the principal opponents of the Arians 47), the Arian doctrine held no secrets. There were learned men like Eusebius of Caesarea, who knew ancient Church history to the finest detail. By the many graces of God the bishop of Cyprus, Spiridion, had come to great sanctuary; this bishop was famous for his miracles and James of Nisbee was also known as a wonder-worker. Others had heroically testified to their faith in times of persecution and could proudly show their wounds; for example, Paul of Neocaesarea, Paphnutius the Egyptian, Amphion of Epiphania and Potamon of Heraclea in Egypt. Among the participants may also be mentioned Macarius of Jerusalem; the three Apostolic sees of Alexandria, Antioch, and Jerusalem were all present, while the see of Rome was represented. Lientius of Caesarea in Cappadocia possessed the gift of prophecy. Nicholas of Myra was known as the great benefactor. Eusebius rightly wrote: "Of these servants of God, some were distinguished by their wise words, others by their strict life, patience, and self-control; others again were endowed with the virtue of modesty. There were those who were honored for their great age, others distinguished by their youthful strength of body and soul, or had only recently come to this degree of ministry [the episcopal office] 48). And Theodoret later testified: "Many there were at that time who were distinguished by Apostolic gifts: many who bore in their bodies the stigmata of the Lord Jesus 49). Among those who accompanied their bishop to the Council as priests or deacons, the most famous must be mentioned: St. Athanasius, who as a young deacon of Bishop Alexander of Alexandria was the most vehement opponent of the Arian party 50). That Rome occupied and should occupy a very special place according to the Orientals, is evident from what Eusebius of Caesarea relates in his *De Vita Constantini*. In the seventh chapter of the third book, Eusebius is enumerating which regions are represented by their bishops and he closes the series with the words: "the head of the imperial city [Rome], however, was absent because of old age, but its priests were present to take his place" 51).

After the series of bishops who were present, this special and isolated mention of the absence of Rome's bishop is nevertheless an indication that, according to the Easterners, Rome occupied a special place. This is all the more compelling when one takes into account that of the other Western regions, only the representative of Spain is mentioned by name by Eusebius, the in the East famous and revered bishop of Cordova, Ossius. Neither the brevity that Eusebius observes, nor the great prestige

that Ossius enjoyed, are able to displace the thought of and the mention of Rome. Finally, although Eusebius in this seventh chapter speaks exclusively of the bishops, only to add at the end of the eighth chapter that the number of priests, deacons, acolytes and others can hardly be indicated, the representation of Rome by two priests is nevertheless recorded in the seventh chapter. From the quoted text, however, it cannot be proven that, according to Eusebius, Rome occupied that special place for dogmatic reasons; that special mention can, perhaps must be explained by the fact that Rome was the "capital of the empire", to which Eusebius himself points out 52).

The first meeting took place on the 20th of May in the year 325. This is the date that Socrates found in the notes of the council documents 53). The bishops met in the great hall of the imperial palace. The meeting was attended by the emperor, who was accompanied only by a few Christian courtiers; Constantine resembled "an angel of God from heaven" 54). The bishop, seated at the right hand of the emperor, rose and thanked him for the care he had taken for the sake of the Church. Then the emperor made a speech to the Fathers, beginning with the words: "It was my most fervent wish, beloved, to be able to rejoice in your assembly, and this has now fallen to my lot. I express my gratitude to the King of the universe, that after all other benefits He has given me this surpassing pleasure to see; I mean this, that I have been able to see you all come together in one place in the spirit of concord and harmony" 55). The emperor considered a strife within the Church of God worse and more dangerous than any war or quarrel, and this strife grieved him more than any other thing. Therefore, as soon as he had learned of the discord, he had made every effort to summon all to this synod without delay. "And I now rejoice to see your assembly". Then Constantine urged them to remove all causes of discord and to secure peace. With that this speech ended, which is rightly called "the speech on peace". This speech, delivered by Constantine in Latin, was immediately translated into Greek. After this the emperor gave the floor "to the presidents of the synod" 56). According to Eusebius, the emperor had to guide the heated discussions several times in the right direction and use all possible means to restore peace. This representation will not be entirely true, and must be attributed in part to the ardent desire and premeditated intention of Eusebius to praise the emperor as highly as possible 57). According to Rufinus, laymen, some of whom were not even Christians, joined the company to dispute with the bishops; their attempts to bluff the bishops with dialectical reasoning would have been frustrated by the simplicity of faith which the church princes displayed 58). This dispute between the pagan philosophers and the Fathers of Nicea certainly belongs to the realm of fables 59). The question of who held the presidency presents no small difficulties. It has just been heard that a bishop seated at the right hand of the emperor opened the first meeting with an address to the monarch. According to the heading of the eleventh chapter in the third book of the Vita Constantini, this bishop was called Eusebius, and it must therefore have been Eusebius of Caesarea himself. But, since the headings of the chapters were not added by Eusebius, but only later, little or no value can be attached to this testimony. Constantine, after having made a speech himself, gave the leadership of the discussions into the hands of the "xipoeSpoL" or "chairmen." It seems that there were several leading persons to be. Who were these persons? According to Theodoret, Eustathius of Antioch acted as the leading person 60); Theodoret probably derived this from a letter written a few years earlier by John of Antioch (429-441) to Proclus of Constantinopel (434-446), in which the exaltation of the Antiochene see is emphasized 61). The testimony is therefore not very reliable, both because of the great distance from Nicea and because of the tendency 62). Were perhaps the Roman priests Vito and Vincentius, as legates of the Pope, the presidents of the Council? This is not very likely, since there are no positive data for this opinion, and a study of the conduct of Rome up to the Council of Chalcedon (451) shows that the Roman legates did not go to the councils to preside, but only to assist and, if necessary, to show by their presence the adhesion of the Holy See. 63) Moreover, Pope Julius writes in the year 341 about these Roman legates that they were present at Nicea and there confirmed the orthodox faith; if these priests had indeed also been the presidents, Pope Julius would probably have mentioned this in this letter within twenty years after Nicea. 64) The bishops at Nicea would also have found it difficult to accept that simple priests presided over their meeting; If they had done so and the peculiar fact had taken place that priests had the leadership over bishops, the actual and actual persons authorized to judge, then this would probably have been recorded as something striking in the sources or at least clearly stated in some source. The candidate suggested to us by the eyewitness Athanasius can reap more certainty. In the year 357 Athanasius writes about Ossius: "What synod is there that he has not presided over?"

65). Could Athanasius, who apparently does not expect any objection, have written this if Ossius had not presided over the most important Council? And to confirm this testimony of Athanasius, there are the lists with the signatures; on all these lists the name of Ossius is at the top, followed only by the names of the Roman priests. It is therefore very likely, if not almost certain, that Ossius held the chairmanship. Equally unlikely, however, is that Ossius would owe this presidency to a delegation from the Holy See; it was Rome's custom not to reserve the presidency for itself in any way; on the contrary, until the Council of Chalcedon Rome left the question of the presidency to circumstances 66). The choice of Ossius as president can hardly be attributed to the fact that he occupied the see of Cordova; this see was not important enough for that. Undoubtedly Ossius owed the presidency to his personal prestige, to the confidence that he had long enjoyed with Constantine and thus also to the emperor's favour, to the fact that he was well informed about the theological questions at issue and finally to the fact that as a Western bishop he could be considered more suitable to judge the disputes between the Easterners in an impartial manner 67).

The Arian question was in the centre of attention. Although Rufinus mentions that Arius was summoned to the meetings several times to give an account of himself 68), it is not very likely that he was admitted to a discussion with the bishops. Even if Arius himself was not present, he had supporters and defenders among those present; Philostorgius gives a list of twenty-two names, among which are Eusebius of Nicomedia, Theognis of Nicea, Maris of Chalcedon, Theodotus of Laodicea, Paulinus of Tyre, Eusebius of Caesarea, Athanasius of Anazarbus, Gregory of Berytus, Aetius of Lydda, Menophantes of Ephesus, Patrophilus of Scythopolis and Narcissus of Neronias; also the Egyptian bishops Theonas of Marmarica and Secundus of Ptolemais, who had already been condemned in their own country, belonged to this group 69). Moreover, the Council had the writings of Arius at its disposal to be able to pronounce judgment; thus, at the Council, several passages from his Thalia were read, and this was enough to arouse indignation: upon hearing these blasphemies, the bishops stopped their ears 70). It was agreed that the real Godhead of the Son was a point of faith. Some now thought that one should continue to adhere to the creed that had been handed down from the beginning and that one should not introduce anything new; they belonged especially to that category of persons who in their simplicity of faith had a great fear of elaborating the content of the faith on reasonable grounds. Others, however, were of the opinion that one should not follow the earlier views without investigation 71). This difference of opinion led to lengthy discussions. It was indeed a difficult task to briefly record the traditional faith in precise terms. At first one tried to use only words from Holy Scripture. This was also in accordance with the wishes of the Arians themselves, because they hoped that the expressions would then be vague and general enough to allow an interpretation in accordance with their doctrine. For example, the Fathers wanted to accept the expression; the Logos is from God (ἐκ τοῦ Θεοῦ), meaning by this that the Son is not from nothing, as the Arians taught. Eusebius of Nicomedia and his followers readily accepted this expression, saying: for we also are of God, for all things are of God, as the Apostle Paul says (I Cor., VIII, 6). When the Fathers noticed this tactic, they felt compelled to define this "of God" more precisely. They now wrote: the Son is of the essence of God (ἐκ τῆς οὐσίας τοῦ Θεοῦ). Thus, words of Scripture alone were not sufficient; precise definitions were necessary to safeguard the pure doctrine against the Arians 72). Thus one arrived, one had to arrive, at the term "co-independent" or "ὁμοούσιος;" 73). Even among the Eusebians disagreement arose, and some of them sought refuge in silence when they understood the weakness of their position 74). These latter also foresaw a condemnation, which was certainly capable of infuriating their fervour; for a condemnation could mean for the adherents the loss of their office and dignity.

In order to avoid the so precise and therefore so feared ὁμοούσιος;, Eusebius of Caesarea intervened. He presented to the Council the baptismal confession that was in use in his church; it would be able to satisfy both parties. This procedure is known from a letter that Eusebius himself wrote to his faithful after the Council in order to justify his attitude at the Council; as Eusebius writes, this confession was read in the presence of the emperor and was recognized as good and right 75). The emperor, according to Eusebius, praised this confession and urged everyone to accept and sign it; only the term ὁμοούσιος; had to be added. Indeed, the Fathers of Nicea included the word ὁμοούσιος; in their confession of faith, thereby establishing a profound difference between the Nicene symbolum and that of the Church of Caesarea; but there are still more important differences between the two formulas 76). The confession of Eusebius might perhaps have been accepted by the Arians, but the Nicene creed was so

clear and precise that the Arians were cut off from evasions. The principal term, the ὁποόατογ, more or less suspected in the East because of the abuse of Paul of Samosate, was inserted probably especially under the influence of Ossius of Cordova and the Western Fathers in general 77), since this term had already acquired civil rights in the West and especially in Rome 78). Later Basil or John Chrysostom 79) would make the statement that the redaction of the creed was entrusted to a deacon named Hermogenes, who became bishop of Caesarea in Cappadocia 80).

After lengthy deliberations, after much struggle and a careful investigation, the Nicene Creed was established on 19 June 81). Provided with the anathematism of the Arian doctrines, this creed has been preserved in a letter from Eusebius of Caesarea to his faithful 82). All the bishops present at the Council were requested in order to sign 83) and all immediately complied with this request, convinced that this formula contained the ancient and apostolic faith of the Church 84). However, when the creed was handed to Eusebius of Caesarea for signature, he asked for a moment's reflection; then he too signed 85). Eusebius himself wrote to his Church after the Council that he had not wanted to sign before having made a careful investigation into the meaning intended by the Fathers by expressions such as ἐκ xfjc; οἰαίαq and ὁποόαιoc;; after questions and answers he was reassured about this; out of love for peace and in order not to keep himself aloof from the pure faith, he no longer wanted to reject the term ὁποουατοc; 86). Only two Arian bishops stubbornly refused to sign: the Egyptians Secundus of Ptolemais and Theonas of Marmarica 87). Philostorgius relates that the other Arian bishops, named Eusebius of Nicomedia, Theognis of Nicea and Maris of Chalcedon, used a ruse by signing a text in which the word ὁποόατοq had been replaced by the term ὁποτοόotoq 88). This is not very likely. Theonas and Secundus were excluded from the Church; the same fate befell Arius and all who would adhere to his doctrine; the writings of Arius also fell under the anathema 89). Secundus, Theonas, Arius and the priests who remained loyal to him were immediately banished by the emperor to Illyria.

After the Arian question had been settled, the Fathers turned their attention to the Meletian schism in Egypt. The schismatic Meletians supported Arianism and had brought Bishop Alexander of Alexandria before the Empress as an accusation 90); Constantine had left the judgment to the great synod. The Fathers took a very moderate attitude towards the Meletians. Meletius himself retained his title of bishop and was allowed to remain in Lycopolis, but to administer no more ordinations; the bishops he had ordained, twenty-eight in number 91), priests and deacons were admitted under mild conditions 92).

There was still a difference between the Church of Antioch and that of Alexandria in the calculation of the date of Easter. This gave rise to unpleasantness. This question also had to be resolved by the Council. The Nicene Fathers decided that henceforth Easter would be celebrated on the same date throughout the Church. The Antiochene Church, which until then had borrowed its calculation from the Jewish one, now adopted the usage of the Alexandrian and Roman Churches 93). The agreement does not seem to have been reached without difficulties; under the leadership of Eusebius of Nicomedia the Syrians asserted their tradition 94); in the end, however, they yielded to the opinion of the others.

Finally the Council issued twenty canons 95). The contents of this need not be given here; it may only be noted that the Nicene canons in many places are a repetition and supplement of the canons of Arles, so that here too, as in the confession of faith, the influence of the Western bishops on the Council becomes visible 96). The terminology of these prescriptions is significant. In the second canon the Fathers say: "it seemed good to us that in future such a thing should not occur again"; the canon closes with the words: "he who acts contrary to these provisions and presumes to oppose this great synod, runs the risk of losing his clergy" 97). In the third canon it imposes a ban on bishops, priests and deacons in the sixth canon. 98) The Fathers again call their meeting in the sixth canon the "great synod" 99) (in the eighth, fourteenth, fifteenth, seventeenth, eighteenth and twentieth canons even "the holy and great synod 100). In the eleventh canon, however, it simply says "the synod 101). The fact that this Council uses "the great synod" three times and even "the holy and great synod" six times for the first time within the short space of only twenty canons does indicate that the Nicene Fathers themselves were convinced of the very special character of their meeting; the conviction that a synod of this character had never taken place and that they enjoyed the privilege of composing such a synod for the first time in history, made the Fathers use a new, more exalted terminology, which was adapted to the sublimity and special value of this Council; the ordinary "placuit" or "synod" was no longer sufficient and had to make way for the "great and holy synod".

The collections of the canons of various synods, which collections were soon compiled and widely distributed (4th century) 102), also offer a favorable testimony to Nicea. For from these collections appears the conviction which the East possessed concerning the special position of Nicea. Not only does the Synod of Nicea receive special

56665 epitheta ornantia in those collections as "the great, holy, and ecumenical" 103) but its canons even take first place, so that the decisions of earlier councils such as Ancyra in Galatia (314) and Neocaesarea in Cappadocia (between 314 and 325) come

56670 after those of Nicea. Thus the already cited collection of Marouta of Maipherkat 104) explicitly states: "Those canons [meaning those of Ancyra] are chronologically earlier than the canons of Nicea. But because of the authority of the great and holy Synod of Nicea, being canons of Nicea in the first place written down" 105). After the canons of Ancyra come in this collection the canons of Neocaesarea, where it is noted: "These canons are indeed of a later date than the canons of Ancyra, but nevertheless existed before the canons of Nicea" 106). This collection and other

56675 Greek, Arabic, Chaldean, Ethiopian and perhaps also Armenian ones observe a hierarchical order as far as Nicea is concerned, but with respect to the other councils they are again chronological, they go from Ancyra, Neocaesarea, Gangra, Antioch, Laodicea to Constantinopel (381).

56680 This makes it easy to explain that later, like for example Pope Zosimus (417-418), canons were attributed to Nicea that were not from Nicea; in the manuscripts, above the canons that followed those of Nicea, there were no more names of the various councils to which they belonged; the copyists had not copied the names. This may have happened by chance, but it was most probably done deliberately, in several cases at least, in order to let these particular decisions with their limited authority share

56685 in the universal authority of the canons of Nicea. The flag of Nicea had to cover the lesser cargo and ensure its sales area. Nicea suffered the same fate as the Apostles, to whom, because of their authority, considerably more has been attributed than corresponds to reality 107).

56690 It is not possible to say with certainty at what date the end of the Council should be placed. Arguments can be made for 19 June 108), 25 July 109) or 25 August 110); 19 June, however, is the most likely date 111). Constantine, convinced that the much-desired unity and peace had been achieved, wanted to celebrate the outcome of the deliberations with great festivities. The occasion was all the more favorable, because Constantine was just commemorating his twenty-year jubilee as emperor. The

56695 monarch invited the Fathers to a grand banquet, about which Eusebius of Caesarea writes with great enthusiasm 112). Before leaving Nicea, the bishops came to the emperor, who gave an encouraging and edifying speech, presenting the bishops with gifts and then gave them permission to return home 113).

56700 Before their departure, the Fathers had sent a synodal letter to the bishops of Egypt, Libya, and the Pentapolis, in which the decisions taken on the three points under discussion: Arianism, the Meletian schism, and the date of Easter 114). This letter, with the creed and the canons, the only authentic ones that have survived from Nicea, is addressed: "To the by God's grace holy and great Church of Alexandria and to the beloved brethren in Egypt, Libya, and the Pentapolis, the bishops

56705 assembled at Nicea and composing the great and holy synod, greetings in the Lord." 115). In the letter itself, the Fathers call their Council three times "the holy" or "the great and holy synod" 116); twice the expression "synod" occurs without further ado 117). The Fathers also expressly mention the fact that the condemnation of Arianism was unanimous 118) and the fact that unanimity had been reached on the

56710 Easter question 119). The synod probably sent other letters of similar or nearly similar content, but these have not been preserved. It has rightly been asked whether there were never any official Acts of this Council or stenographic reports of the sessions. In view of the custom on other occasions, both before and after Nicea, it is very likely that stenographic reports were made. But it is certain that no trace

56715 of these reports can be found anywhere 120). That a council such as that at Nicea possessed more than ordinary power or influence was also the conviction of Emperor Constantine, as is evident from one of his letters, written after the Council to the various absent Churches about "the one faith and pure love as well as harmonious worship of Almighty God" 121).

56720 The Emperor writes: "But since it was not possible to make a fixed and lasting arrangement, unless all, or at least a large part of the bishops came together for that purpose", we have summoned as many as possible 122). And the result of this meeting is that "nothing remains for disagreement or conflict of faith" 123).

56725 May Constantine also indicate the origin of the authority at the end of this letter with the words: "This being so, receive with joy the grace of God and the truly divine commandment; for everything that happens in the holy synods of bishops is

traceable to the divine will 124), yet one finds herein no indication and explanation of the special authority that this General Council possessed, since according to the text the decisions of every synod of bishops contain a divine command and are traceable to the divine will. In the same vein, Constantine had already written to the bishops after the Council of Arles: "The judgment of the priests must be considered as if the Lord Himself were present and judging. For they may not think or judge anything other than what has been taught them by their teacher Christ" 125). We see this more clearly than in the previous letter to the Church of Alexandria, in which, according to him, the deepest foundation of the absolute authority of the Nicene Fathers lies. The emperor exults:

"We have received a perfect favor from divine Providence, that we are especially delivered from every error and profess one and the same faith" 126). Constantine then emphasizes once more that the more than three hundred bishops have established one faith and that only Arius remained caught in the snares of the devil. What these bishops taught is the truth, "for what pleased the three hundred bishops is nothing other than the opinion of God, especially since the Holy Spirit is in the minds of such men and makes known the divine will. So that no one may doubt" 127). The Fathers derived their authority from the assistance of the Holy Spirit. The historian Socrates also draws attention to this opinion of Constantine in the following words: "The opinion of all who came together, he [Constantine] calls simply the opinion of God, and he firmly believes that the unanimity of so many and such bishops is due to the Holy Spirit" 128). Socrates adopts this view when he argues against the Macedonian Sabinus, who accused the Nicene Fathers of ignorance and stupidity: "but he [Sabinus] did not consider that, even if the Fathers were undeveloped, they were enlightened by God and the grace of the Holy Spirit and could in no way miss the truth" 129). The assistance of the Holy Spirit is therefore the most important thing; by it the Fathers are protected from error, even if they may be undeveloped.

A summary of the results of this chapter may first draw attention to the persons who initiated this Council. Although the initiative is attributable to the spontaneous, common thought of many who saw a great danger in the teaching of Arius, and of those who longed for unity, peace and order in Church and State, one may nevertheless say that prominent persons such as Alexander of Alexandria and Ossius of Cordova from the ecclesiastical side and an emperor Constantine from the political side must have had a suggestive share in it. The initiative was transformed into reality, in other words the Council was convened by him who was practically the only one capable of doing so: Emperor Constantine. That it was the emperor who convened the council on his own authority is evident from Constantine's own letter of convocation, from his speech to the Council Fathers, from his letters to the Alexandrian Church and to the Church of Nicomedia, and from his circular letter to the Churches. The Council itself also testifies to this in its letter to the Church of Alexandria, as do Eusebius of Caesarea and the later historians Rufinus, Socrates, Sozomenus, and Theodoret, who all attributed the emperor the right of convocation.

The great majority of those present at the Council came from the East; but the various parts of the West were also represented; only from Britain no participant is known. The whole Church and all parts of the Church therefore made their voices heard at this Council, so that this Council is in truth the first synod of the "oiKoupévr]" or the first "ouvo&og oiKoopEVLKp". From the way in which Eusebius of Caesarea describes the various regions and their representatives, it is clear that the Bishop of Rome, according to Eusebius' view and according to that of the Orientals in general, occupied a special place among the ecclesiastical dignitaries; the reason, however, for this special esteem in relation to the Pope is not indicated. The question of the presidency at the Council cannot be resolved with complete certainty. But at least Ossius of Cordova was the president, who enjoyed that privilege because he was more or less the designated person for it for incidental or coincidental reasons; the idea that he owed the presidency to a delegation from the Holy See can safely be dismissed as unfounded. It may also be safely denied that the Roman priests Vito and Vincentius presided over the Council as delegates of the Pope. This can of course be combined with the fact that these priests and other prominent persons assisted Ossius with advice in his difficult task, which involved such great responsibility.

Three important questions were settled by this Council by unanimous decision: the Arian question, the Meletian question and the question of the date of Easter. In the conviction that the Nicene Creed contained "the ancient and apostolic faith of the Church", all signed this formula, even the former defenders of Arius; only two

56795 Egyptian bishops, Secundus of Ptolemais and Theonas of Marmarica, stubbornly refused to sign. The refusal of two of those present shows that the expression of "unanimity" that was also used and customary at that time should not be taken in an absolute sense. Nor is it necessary that the opinions were unanimous from the first moment, since it appears from the De synodis of Athanasius that agreement regarding the Easter question was only reached after the Syrians, led by Eusebius of Nicomedia, had put up resistance; moreover, the drafting of the creed was preceded by days of discussions. The good end result is born from the choc des idées and therefore Fathers from the entire Church were gathered to be able to choose the right position after mutual consultation, that is, after an exchange of thoughts and opinions. Despite the relatively small number of Western bishops at this Council, one may see a strong Western influence in the fact of the insertion of the term ὁποῦαιος; in the creed; the East itself was averse to this term, which had already been discredited a century earlier by Paul of Samosate, the West, on the other hand, especially Rome, had a special preference for this expression; Ossius of Cordova in particular will have exerted his influence and dominance over the Easterners here. Western influence also becomes visible when one compares the twenty canons of Nicea with those of Arles.

56800 If one extends the comparison still further by confronting the Nicene canons with the canons of all earlier synods under the supervision of the terminology used, one finds the fact that the Nicene Fathers employ a new, more elevated terminology, adapted to the sublimity and special value of their Council. The Nicene Fathers themselves were therefore convinced of the very special character of their meeting. They also bear witness to this in their synodal letter to the bishops of Egypt, Libya and Pentapolis. The more than ordinary power or influence of Nicea was also recognized by Constantine the Great, as appears from several of his letters. Constantine derives the authority of the Council Fathers in general and that of the Nicene Fathers in particular from the assistance of the Holy Spirit, whereby the council opinion is the opinion of God. In the first half of the 5th century, the historian Socrates even declares that the assistance of the Holy Spirit is the only cause of authority and not the learning or otherwise of the Council Fathers. Already in the 4th century, the various collections of canons give very favorable testimony to Nicea; not only do these collections use a special terminology for Nicea, but they also place this Council on the highest level of the hierarchical gradation; of all the councils, Nicea is the most important.

56815 The General Council of Nicea is a council that was not convened by the Pope and was not chaired by his legates, the priests Vito and Vincentius. Did the Pope perhaps make use of the sovereign right to ratify the decisions? Before answering this question, it is necessary to determine the meaning of the term "ratify". A double ratification can be distinguished. The one is already included in the fact that the Pope, either personally or by means of legates, takes part in the council and its deliberations, gives his vote and signs the acts with the others. The second is present when the Pope, by a separate act, ratifies the decisions taken at the end of the council. If there is to be a ratification in the second sense, the papal ratification must be found after the council and not as part of the council itself. For this approval or confirmation in the second sense, it is also not sufficient to demonstrate that the Pope accepts the council decisions; simply accepting or, which is the same, not rejecting cannot be equated with what is understood and must be understood by the term ratify. Ratifying means giving a decision validity and legal force, so that with the demand for papal ratification in the second sense, the council decisions have no validity and legal force without that ratification and the decisions only acquire validity and legal force through and with that papal confirmation. If one applies these general remarks to the first General Council of Nicea, then there is no doubt that the decrees of Nicea possess papal ratification in the first sense. Vito and Vincentius participated in the deliberations as legates of Pope Sylvester and gave their assent to the decrees concerning the Arian, the Meletian and the Easter question, in particular also to the Nicene Creed; all decrees were taken with "unanimity", and therefore also received the vote of the papal legates. To doubt this, because the sources do not specifically record the assent of the papal legates when mentioning "unanimity", would be hypercritical. Moreover, such doubt would be completely destroyed by the fact that the papal legates signed the acts of this Council, in other words the aforementioned decrees and the twenty canons, and thus approved and ratified them. That Pope Sylvester, however, would have ratified the Council of Nicea by a special act after the end of the Council, cannot be demonstrated by any testimony and must, in view of the absence of this ratification compared to the other General Councils in Antiquity, be denied by

analogy. Christian Antiquity considered papal ratification in the first sense sufficient, but not necessary in the second sense 130).

If the Emperor had summoned the Council, he also gave permission to return home. After the Council, Constantine wrote a letter to the various absent Churches and one to the Church of Alexandria, in which he made the decrees of Nicea known to his people and gave them civil force.

CHAPTER III THE EUSEBIAN REACTION AGAINST NICEA

Emperor Constantine was mistaken when he thought that the decision of Nicea would definitively put an end to discord, unrest and differences of opinion. After Nicea, religious unrest in the East really broke out. Several bishops had given their signature at the council out of fear of and under pressure from the emperor. Among them were especially Eusebius of Nicomedia and his followers, who formed a strong middle party between the real Arians and the orthodox 1). Eusebius and the real Arians formed an alliance in their fight against Nicea and the orthodox, their common enemy. In Egypt they found allies in the Meletians, who, despite the mildness of Nicea towards them, continued to sow unrest. The most complicated contradictions revealed themselves, the most unsavory means of struggle were used and it is not without reason that Socrates compares the religious disputes after Nicea with night battles 2).

Barely three months after the conclusion of the Synod of Nicea, Eusebius of Nicomedia, Maris of Chalcedon, and Theognis of Nicea informed the emperor that they were withdrawing their signature from the Creed of Nicea. Constantine acted as the protector of orthodoxy and of the Creed for which he had taken so much trouble: he sent the three opponents into exile in Gaul. The emperor even succeeded in having new bishops elected for the sees of Nicomedia and Nicea, Amphion and Chrestus respectively. A few years later, on June 7, 328, the opponents of Nicea saw their greatest enemy ascend the see of Alexandria: St. Athanasius, who had already been designated as his successor by his predecessor Alexander. The hatred of the Eusebians and Arians against Athanasius dated back to the Council of Nicea. whereupon Athanasius, then still a deacon, had taken a very determined attitude towards Arian impiety 3).

However favourable the situation seemed on the surface for orthodoxy, thanks to the emperor's strong support, the struggle soon broke out. Eusebius of Nicomedia had a powerful advocate at the imperial court in the emperor's sister, Constantia; perhaps also in the emperor's mother, Helena, whom Eusebius regarded only as the disciple of the martyr Lucian of Antioch 4), whom she greatly revered. It is probably due to their efforts that Constantine allowed Eusebius and Theognis to return to their dioceses in 328, after they had given him reassuring assurances 5). They even resumed the leadership of their Church, despite the rights of their legitimate successors. From that time on, Eusebius waged a subtle diplomatic war against the faithful adherents of the Nicene $\acute{\omicron}\rho\theta\omicron\upsilon\alpha\tau\omicron\varsigma$; especially against the leaders of orthodoxy, whom he tried to render harmless. While Eusebius and his followers pretended to submit to the decisions of Nicea, they secretly and in various ways tried to destroy the $\omicron\pi\omicron\omicron\omicron\alpha\iota\omicron\gamma$ and to make their Arian and subordinate views prevail. The emperor was won over above all by the deceptive promise of complete unity in doctrinal matters: Arius and his followers were supposedly orthodox at bottom and prepared to sign an eighteen-carat orthodox formula of faith, if they were allowed to return from exile 6).

After Eusebius of Nicomedia had tried in vain to discredit the election and ordination of St. Athanasius, he turned against another champion of Nicea, Eustathius of Antioch. He was accused of Sabellianism. At the end of 330 or the beginning of 331 Eusebius convened a great synod at Antioch against Eustathius. At this council, among others, Eusebius of Caesarea, Patrophilus of Scythopolis, Aetius of Lydda and Theodotus of Laodicea were present as partisans of Eusebius of Nicomedia. According to Socrates, Cyrus of Beroea was the main opponent of Eustathius at this synod and formally accused him of Sabellianism. Eustathius was also wrongly accused of less honourable matters 7). The "unlawful assembly" 8) deposed the bishop of Antioch, which caused a violent popular uprising in the city, where Eustathius was much loved. Emperor Constantine, informed by bias, sent Eustathius into exile, where he must have died a few years later. The assembled bishops elected Paulinus of Tyre as their successor, and from this time dates the endless struggle for the episcopal see of Antioch, a struggle which continued throughout the century and which led to a serious crisis between East and West after the Council of Constantinople in 381 9). Several other orthodox bishops suffered the same fate as Eustathius of Antioch at this time.

56925 Once again, Athanasius was chosen as his victim. The Eusebians made common cause with
the Meletians in Egypt, and together they presented false accusations against the
Alexandrian bishop to the emperor. Their first attempts failed, because Athanasius
managed to convince the emperor of his innocence 10). After this failure the
56930 Meletians tried to win the friendship of Athanasius, but soon they were again incited
against the Alexandrian by the Eusebians. Barely ten years after the Council of Nicea
the unrest in Church and State was greater than ever. Cunning as they were, the
Eusebians had already proposed to the emperor several times to hold a great council
and thereby restore peace and unity in Church and State. The most favourable
56935 opportunity now presented itself. In 335 the emperor was going to celebrate his
thirty-year jubilee of reign and this year was also the tenth anniversary of the
Council of Nice. Constantine wanted to embellish and immortalize the celebration of
his Tricennalia by consecrating the new Church of the Holy Sepulchre in Jerusalem. A
large number of bishops had to be present. "How much more impressive would all this
be if unity among the bishops had been restored beforehand," said the Eusebians.
56940 And "the emperor, beloved of God, again called for a synod of very many bishops and
drew them up like an army of God in battle array against the blasphemous devil: from
all Egypt and Libya, Asia as well as Europe, he urged them to hasten, first to put an
end to the discord, then to perform the aforesaid sanctuary; he therefore ordered
that they should resolve the dispute en passant in the metropolis of Phoenicia
56945 [Tyre]" 11). The emperor also addressed a letter to the holy synod in the city of
Tyre, held in the year 335, from which letter it appears that the ex-consul Flavius
Dionysius was appointed to keep a watchful eye on the assembly on behalf of the
emperor; if there should be a bishop who refused to come against the orders of the
empress, she would drive him into exile; finally Constantine urged to put aside all
56950 dissension 12). Socrates 13), Theodoret 14), Rufinus 15), Epiphanius 16) and also
Athanasius 17) also report that this synod was convoked at Tyre by the emperor.
A large number of bishops were present. "And there appeared at the synod at Tyre
bishops from various places, about the number of Nestig," writes Socrates.) To these
there were added eight Egyptian suffragan bishops of forty, nearly one hundred i») 20).
56955 The Eusebians were of course very strongly present; in Tyre one saw leaders such
as Eusebius of Nicomedia, Eusebius of Caesarea, Theognis of Nicea, Maris of
Chalcedon, Macedonia of Mopsueste, Flaccillus of Antioch, Theodore of Heraclea and
Patrophilus of Scythopolis; also two bishops from Pannonia, who would play a great
role in the following years, made their entrance into the company of the Eusebians:
56960 Valens of Mursa and Ursacius of Singidunum 21). The few moderate or orthodox bishops,
such as Maximus of Jerusalem, Alexander of Thessalonica and Marcellus of Ancyra could
not exert any influence on the course of events 22); the orthodox bishops from Egypt,
who accompanied Athanasius, were denied entrance 23). Now Athanasius refused to
appear, but in the end he had to yield to the emperor, who threatened to use force
56965 otherwise 24). Macarius, an Alexandrian priest, against whom the Eusebians had also
brought a false accusation, was even taken in chains to Tyre 25).
In Tyre Athanasius found himself among his enemies; the Egyptian-Meletian bishops
acted as accusers, the Eusebians fulfilled the role of judges, Athanasius was the
accused. The presidency rested mainly in the hands of Eusebius of Caesarea 26). The
56970 accusations rained down. Athanasius is said to have broken a chalice, destroyed an
altar, thrown Ischyrras into prison and slandered him to the prefect of Egypt; bishop
Callinicus of Pelusia is said to have been unlawfully deposed by Athanasius because
of this affair 27); other Meletian bishops such as Euplus, Pachomius, Isaac, Achilles
and Hermaeon complained about corporal punishments and all opposed the legality of
56975 Athanasius' choice of bishop 28). The Alexandrian bishop was even said to have
murdered the Meletian bishop Arsenius, and a severed hand was shown as a gruesome
piece of evidence; Athanasius was able to refute this accusation convincingly by
having Arsenius come in and showing him both hands; a great commotion arose and
people even wanted to attack Athanasius. 29). It is also reported that a woman was
56980 brought in, who was said to have been violated by Athanasius, but this accusation
also fell into insignificance, because the woman showed that she did not even
recognize Athanasius by sight 30); Sozomenus also relates that this case was not
recorded in the acta concilii for no other reason, in his opinion, than because this
case was too shameful and ridiculous to be registered in synodal acts 31); the
56985 authenticity of this story can be seriously doubted and perhaps Rufinus is the
disseminator of it 32), which in the last instance could then be traced back to the
Church History of Gelasius of Caesarea.
Successively the various accusations against Athanasius proved to be without
foundation. The Eusebians tried to divert attention from this by pushing the case
56990 forward against the Alexandrian priest Macarius, who was said to have been the

helping hand in Athanasius' cruelties against Ischyrras. The synod should appoint a commission, which should conduct an investigation in Mareotis itself, the homeland of Ischyrras. The Eusebians intended this, according to Athanasius, to create an opportunity to take revenge on Athanasius in Egypt during his absence 33). Athanasius considered an investigation in Mareotis superfluous, but in the end the Eusebians and Meletians succeeded in having a very partial committee sent, consisting of Theognis of Nicea, Maris of Chalcedon, Ursacius, Valens, Macedonius and Theodorus 34). Protected by a military escort and provided with a letter of recommendation for the governor of Egypt, the company set out. Aided by the Egyptian prefect, Philagrius, refused to hear the eyewitnesses; on the contrary, it listened eagerly to the assertions of Jews, pagans, and catechumens, who could not act as eyewitnesses, because it concerned a fact that was supposed to have taken place in the sacrarium, where even the catechumens had no access 35).

This partial and illegal action aroused a fiery protest from the clergy in Egypt and Mareotis; they sent letters to the commissioners 36), to the synod at Tyre 37), to Philagrius and another imperial official 38). Athanasius, according to these letters, is innocent and Ischyrras, who falsely presents himself as a priest, has borne false witness. The Egyptian bishops, who had gone to Tyre with Athanasius, also opposed the conduct of the Eusebians in a letter addressed to the entire council 39). They declared that they had been forced to remain silent by the Eusebians; that those who wished to judge according to justice and equity were harassed by threats or accusations, so that the Eusebians could freely act as enemies. They reproached the embassy and adjured the bishops not to make common cause with the Eusebians, but to fear God more than threats. They sent an almost identical letter to Count Flavius Dionysius 40). Later they sent him another letter, in which it was written that they felt compelled by the intrigues of their enemies to leave the judgment of their case to the emperor 41). This imperial official also received a letter from Bishop Alexander of Thessalonica, warning him against the Eusebians 42). At all this Dionysius contented himself with urging the Eusebians to moderation and caution 43).

As the Eusebians continued to carry out their plans, Athanasius withdrew from their grasp 44), secretly left the city of Tyre and sailed for Constantinople to have refuge with the emperor 45). After the committee had returned from Egypt and had delivered its biased report, the Eusebians, although not present, deposed Athanasius and forbade him to return to Alexandria 46). The committee's report was carefully concealed from Athanasius, and the Eusebians were furious when Pope Julius later sent this report to Athanasius 47). Thus the Alexandrian was condemned on false charges, none of which, remarkably, had any bearing on his doctrine. In Tyre the Meletian bishop John Archaph and his party followers were received into ecclesiastical communion and restored to their office; Ischyrras was even appointed bishop. The decisions were brought to the attention of the emperor and a synodal letter to all bishops imposed the obligation to break off all relations with Athanasius 48). Sozomenus adds: "That this condemnation was not right, was also thought by many of the priests present" 49). Hardly had these decisions been taken when an imperial messenger came to warn those assembled in Tyre to proceed to Jerusalem as soon as possible to attend and to grace the consecration of the church there 50). The Eusebians took advantage of the opportunity to call another council in the same year 335, this time in Jerusalem. Eusebius of Caesarea writes in praise of this: "The whole place here was then filled with a very great choir of God, because the illustrious bishops from all the provinces came together in Jerusalem; for the Macedonians had the bishop of their metropolis sent 51), the Pannonians and the Moesians the flower and ornaments of the young bishops consecrated to God 52); also from the Persian bishops there was a holy ornament present, a man exceptionally skilled in the Holy Scripture, and also the Bithynians and the Thracians increased the splendor of the synodal college 53). Nor were the most famous of the Cilicians lacking. of the Cappadocians, among all, those who were most developed in knowledge and eloquence shone forth. And all Syria and Mesopotamia, Phoenicia as well as Arabia with Palestine itself, the Egyptians with Libya and the inhabitants of Thebais, all together made up the great choir of God; them followed an innumerable multitude from all provinces; and they were all assisted by imperial servants, and from the imperial palace itself excellent men had been sent to enliven the festivities with funds provided by the emperor" 54). The bishops were received magnificently on behalf of the emperor by the tribune and notary Marianus 55). While the preceding quotation from Eusebius, especially through the expression "the great choir of God", strongly recalls the description given by the same author of Nicea, in the following quotation this council in Jerusalem is even expressly placed by Eusebius on a par with the Nicene. "This second synod, he writes, which to our knowledge is the greatest, was

convened by the empress Jerusalem, after the first, which was held by him in the famous city of Bithynia" 56). Other sources, however, draw the true picture of this great meeting; not on the same level as Nicea, but the antithesis of Nicea Before giving the synodal letter of this synod, St. Athanasius introduces his chapter thus: "Meanwhile, they were [the Eusebians] but never tired of continually holding synods against the General [of Nicea]. For although the Eusebians were deposed after the Synod of Nicea, yet after a time they insolently invaded the Churches and even began to harass the bishops who opposed them, and to appoint in their place adherents of their own heresy against the Churches; in order that they might [thus] hold synods at will, since they [now] had men who were on their side and whom they had purposely ordained for this very purpose. They now assembled in Jerusalem" 57). To the question put by the emperor concerning the confession of faith submitted some time before by Arius and his followers, the Eusebians replied that that confession was sufficient and orthodox, and they solemnly declared that the Arians should be received into communion 58). These decisions they communicated by synodal letter to the emperor, to all the bishops and to the entire clergy, especially to that of Egypt, so that this example of tolerance would be followed everywhere. The opening of this synodal letter reads as follows: "The holy synod, which by the grace of God is assembled in Jerusalem, to the Church of God in Alexandria, and to that in all Egypt, and Thebais and Libya and Pentapolis, and to the bishops and priests and deacons throughout the world, salvation in the Lord" 59). The Eusebians write that they have received Arius and his followers at the instigation of the emperor, because Constantine accepted the orthodoxy of their creed; this creed "we have all recognized as good and ecclesiastical" 60). They expect great joy from all over this reunion. "And having heard the acts of the council, especially how those persons have united themselves with us and have been received by such a holy synod, it is indeed most fitting for you to enter into communion and peace with your own members, especially since the profession of faith made by them is uncontested and inviolate the Apostolic tradition and doctrine professed by all" 61). Athanasius could rightly pronounce the following judgment on this synod and that of Tyre: "And they did not hesitate to write such things nor to assert that those possessed orthodox opinions which had been condemned by the entire ecumenical synod; nor did they fear to underhandedly render powerless that great synod to the best of their ability, proceeding very lightly in all their sayings and doings" 62). If the Council of Nicea had condemned Arius, the synod of Jerusalem rehabilitated him; both synods are therefore diametrically opposed to each other.

In the meantime, Athanasius lodged his complaint with the emperor in Constantinople. Constantine sent a letter "to the bishops assembled in Tyre" 63). "I really do not know what was decided so tumultuously and stormily by your synod" 64), writes the emperor. The truth seems to have been lost in all this commotion. "Therefore I desire that you all come to me quickly, so that you may give us a precise account of your conduct" 65). They are summoned to Constantinople at the request of Athanasius himself, so that he can complain in their presence about the injustice done to him; all this discord greatly displeases the emperor. After this letter the Eusebians did not feel reassured; they succeeded in preventing the bishops who had protested against the conduct towards Athanasius 66) from going to Constantinople, so that in the end only Eusebius of Nicomedia, Theognis, Maris, Patrophilus, Eusebius of Caesarea, Theodore, Ursacius and Valens left for the imperial city. There they found Athanasius in the company of some other orthodox believers, namely the Egyptian bishops Adamantius, Anubion, Agathammon, Arbethion and Peter. 67) In the presence of the emperor the Eusebius dared to the bishops no longer touched upon the question of the chalice and of Ischyra; they invented a new accusation; Athanasius was said to have threatened to stop the grain supply from Alexandria to Constantinople. When the emperor heard this he flew into a rage, would not even listen to Athanasius's defence and banished him to Gaul 68). Sozomenus adds that the emperor may have done this in the belief that the bishops would henceforth live in peace 69). Later Constantine II wrote that his father had done this in order to free Athanasius from the hands of his mortal enemies and not to punish or condemn him; his father would therefore have wanted to restore Athanasius to his see, but death had prevented him from carrying out this plan 70). Athanasius himself seems to have believed these words 71). Much more likely, however, is that Constantine wanted to carry out the judgment of the synod at Tyre by banishing Athanasius and to gain his imperial approval for it. On the 5th of February 336, Athanasius left Constantinople for his place of exile, the city of Trier 72).

A next victim was Marcellus of Ancyra. At a Eusebian synod at Constantinople in 336,

he was accused mainly of heresy in his writing against the Arian sophist Asterius. Marcellus was deposed and banished; a certain Basilius took Marcellus' seat at Ancyra 73). After Constantine the Great had died on Pentecost in the year 337, Athanasius was able to return to Alexandria 74), where he arrived on 23 November of the same year 75). While Constantine II and Constans remained loyal to the Nicene faith, Constantius, who governed the East, soon became entangled in the Eusebian net. Paul us, the bishop of Constantinopel, was deposed at a Eusebian synod in his episcopal city in the year 338; thrown in chains on Constantius' orders, he too went into exile at Singar in Mesopotamia, while Eusebius of Nicomedia succeeded him in Constantinopel 76).

At the same time the intrigues against Athanasius began to revive; rallying around their own bishop Pistus 77) the Alexandrian Arians and with them the Eusebians accused Athanasius of new crimes, which were brought before the three emperors; Constantius alone considered the charges well-founded. The Eusebians carried their brutality so far that they sent an embassy to Pope Julius I, consisting of the priest Macarius and two deacons, Martyrius and Hesychius, to introduce their accusations against Athanasius in Rome and even to induce the Pope to recognize Pistus as a legitimate bishop. The embassy had to submit to the Pope the reports of the committee sent to Mareotis in 335.

Pope Julius sent Athanasius a copy of these reports, whereupon Athanasius sent some representatives in his defense to Rome and the emperors Constantine II and Constans. Moreover, he had already prepared a synod at Alexandria of all the Catholic bishops from Egypt, Libya, Thebais and Pentapolis. Nearly one hundred bishops met 78) in the year 338. A synodal letter of this synod has the following opening: "The holy synod, assembled in Alexandria from Egypt, Thebais, Libya and Pentapolis, to all the bishops of the Catholic Church, the beloved and much loved brothers in the Lord, greetings" 79). In this letter all the accusations against Athanasius are refuted; no reprisals were taken by Athanasius upon his return to Alexandria against priests or laymen; the facts, brought forward by the Eusebians, took place before Athanasius' return and the responsibility for them rests with the prefect of Egypt, who is not very orthodox; 80) the reason for the hatred against Athanasius is his actions against Arius and Arianism; Athanasius was desired by all as a bishop and lawfully consecrated 881).

How dare Eusebius of Nicomedia and Theognis of Nicea depose one another?

They themselves have been deposed. For the Pope knows that in their place Amphion of Nicomedia and Chrestus of Nicea have been consecrated, because Eusebius and Theognis "have been rejected by the ecumenical synod. This true synod they want to destroy, they try to call their own unjust conspiracy [the synod of Tyre] a synod and while they want to make the decrees of Nicea invalid, they want to ratify their own decrees; and that they call a synod, while they have so sublime a synod with obedient ones. Thus they do not care about a synod, but they pretend to care about it" 82). This is a very different sound from that of Eusebius of Caesarea; this put Jerusalem, which is actually a continuation of Tyre, on a par with Nicea, the Egyptian bishops on the other hand do not want to see Tyre and thus implicitly its continuation in Jerusalem as a "synod" but as a "conspiracy" and underline as strongly as possible the contrast between Nicea and Tyre-Jerusalem. Then the synod letter bears witness to the great joy at Athanasius' return 83). What confidence, the letter continues, did such a synod as that held in Tyre have, what confidence can one place in its decisions? "For what kind of synod of bishops was it then? Was it a meeting that devoted itself to the truth? Were most of them with us with How is it possible that such people want to hold a synod against us? How dare they call such a thing a synod when a count was in charge and a supervisor was present, and a comentarius led us in instead of deacons of the Church. He spoke, those present were silent, rather surrendered to the words of the count. And that those bishops of whom it was clear that they had to be removed were indeed removed, prevented his advice. He ordered, we were led away by soldiers; or rather, the Eusebians gave orders, he, helped them in their decisions. In short, beloved, what kind of synod is this, the end of which could have been banishment and murder If that had been according to the emperor's wish?). This passage does throw a sharp light on the events at Tyre; it was not a real synod, not a meeting of bishops, at which impartial and truthful justice was pronounced on the accusations against Athanasius, but really a conspiracy of the Eusebians with the help of imperial officials and soldiers; the imperial officials and especially the count even somewhat predominated, while at a synod, which aims at the leadership of a spiritual community, the bishops should be the only legal persons. The meeting at Tyre was indeed far removed from the character of a real synod. Then the episode at Constantinopel, end 335 to beginning 336, is discussed; by

banishing Athanasius the emperor managed to prevent the bishop from being killed; Constantine wanted to do well, but could not do otherwise; this was evident from the letter which he had written to Athanasius before the meeting at Tyre, in which he had incriminated those hostile plots, condemned the Meletians, and called them villainous and accursed 85). "But in order that it might be seen that they were destroying both the truth and this imperial letter, those admirable Eusebians gave to their meeting [at Tyre] the name of "synod," and to the synodal acts the appearance of having come from the emperor. Therefore a count was present, and soldiers were the bodyguard of the bishops, and there was an imperial letter which forced them to assemble, which they themselves had requested. But if they left the judgment to themselves as bishops alone [and not to the emperor], why were there any need of a count and soldiers? Or why did they let themselves be assembled by an imperial letter? If they needed the emperor and wanted to borrow authority from him, why did they make his judgment invalid?" 86). An equally sharp indictment against Tyre and a painful dilemma for the Eusebians. The synodal letter deals with the various subjects: on the breaking of the chalice 87), on Ischyra 88), on the embassy of the Eusebians to Mareotis 89), on the conduct of that committee in Egypt 90), on the letter of Bishop Alexander of Thessalonica to Dionysius 91), and on the attitude of the Egyptian clergy and their letters 92). The synod declares that Athanasius had proceeded to the satisfaction of all in the distribution of the grain; the Arians, on the other hand, had tried to get their hands on the grain that was intended for the church 93). The letter ends with a request to all bishops to have compassion for the fate of their fellow bishop Athanasius and to express their indignation about the conduct of the Eusebians 94). In addition, Athanasius expressly testifies that this synodal letter was also sent to Pope Julius 95). When the priest Macarius, the leader of the Eusebian embassy to Pope Julius, learned that a legation from Egypt was on its way to Rome, he left the city during the night despite his illness 96). The deacons Martyrius and Hesychius, however, were confronted with Athanasius's legation and refuted in everything; they seized a last straw and requested the Pope to convene a synod and to write to Athanasius, the bishop of Alexandria, as well as to the Eusebians, so that a just judgment could be passed in the presence of all. For then they would prove all the accusations against Athanasius, they promised" 97). Pope Julius acceded to this request and announced by letter that a synod was to be held at a place of choice by both parties 98).

Athanasius was all the more prepared to respond to this papal appeal, because serious events had taken place in his episcopal city. A certain Gregory of Cappadocia had been appointed by imperial decree as Athanasius's successor 99) and his installation had resulted in acts of violence and bloodshed. This Cappadocian had been chosen and consecrated by the Eusebians at a synod at Antioch in the month of January or February of the year 339, because they understood that Pistus had little chance of being recognized by the Pope. That Eusebian synod is known from the above-mentioned letter of Pope Julius; in it we read: "What kind of ecclesiastical canon or what kind of apostolic tradition prescribes that while the Church is living in peace and so many bishops are in agreement with the Alexandrian bishop Athanasius Gregory should be sent, a stranger to the city of Alexandria, who was not even baptized there and also unknown to most, neither asked for by priests, nor by bishops, nor by the people? But he had been appointed in Antioch and was sent to Alexandria, not in the company of priests or deacons of the city nor in the company of bishops from Egypt, but with an escort of soldiers. For these accusations were told by those who came here; even if Athanasius had been found guilty after the synod" 100), it would still have been against ecclesiastical law to simply appoint someone else. No wonder that Pope Julius did not grant this synod any authority and rightly put the Eusebians to the question, which also contained a serious reproach: "Consider carefully, then, who acted against the canons: we, who after so much proof received this man [Athanasius], or they who, thirty-six days' journey away in Antioch, appointed a foreigner as bishop and sent him to Alexandria with military force?" 101). Athanasius himself also relates that Gregory was appointed in violation of canon law and apostolic tradition and that he was someone "from the palace" 102), sent by the emperor 103). Emperor Constantius and the Eusebian bishops thus always worked together.

After Easter of the year 339 Athanasius arrived in Rome, and Pope Julius immediately sent two priests, Elpidius and Philoxenus, to Antioch, who were to announce a limit within which the Eusebians were expected at Rome to meet at a synod 104). "But the Eusebians, upon hearing that it would be an ecclesiastical investigation, at which no count would appear, nor would soldiers stand at the door, and that the acts of the synod would not be ratified by an imperial edict (for by these means they had always exerted their influence against the bishops, and without it they dared say nothing at

all), were so filled with fear that they kept the priests even after the appointed time and invented a feeble excuse: they could not come now because of the war with the Persians" 105). Very sarcastically, but not without reason, Athanasius remarks: what have bishops to do with war, and why were they prevented by the Persians (in the East) from going to Rome (in the West), a city far away and over sea? Elpidius and Philoxenus were sent back to Rome with a letter containing a sharp protest against a possible revision of the synodal decision of Tyre concerning Athanasius' deposition 106) and an accusation against the Pope for his association with Athanasius and Marcellus of Ancyra 107). The Eusebians refused to come to Rome. After Pope Julius had kept this fiercely arrogant letter of the Eusebians secret for a long time, in the hope that eventually some Eusebians would respond to his appeal 108), he decided to hold a synod in the city of Rome at the end of 340. More than fifty bishops were assembled 109): the Pope, Athanasius, Marcellus of Ancyra, and many bishops from Thrace, Coelesyria, Phoenicia, and Palestine: in addition, many priests from various countries, among whom also a deputation from Alexandria and all Egypte 110). Apparently there were also Italian bishops and priests present 111). After Athanasius had defended himself before them, they received him into communion as well as Marcellus of Ancyra and declared both their depositions for unjust 112). The assembly requested the Pope to make the decisions known in writing to the Eusebians 113). A very detailed letter from Pope Julius went to the East: "Julius to Danius, Flaccillus, Narcissus, Eusebius, Maris, Macedonius, Theodore and their companions, who wrote to us from Antioch, to the beloved brethren, greetings in the Lord" 114). The Pope states that he had finally had to make their arrogant letter known and that everyone was astonished and could hardly believe that the Eusebians had written such a letter 115). Why should there not be an inquiry into whether Athanasius had been rightly deposed by the synod at Tyre? "The bishops also assembled at the great Council at Nicea, not without God's will, had permitted the proceedings of an earlier synod to be examined at another synod. If you do not wish this already ancient custom, mentioned and described at the great council, to be in force among you, such a demand is inappropriate; for that which has once become customary law in the Church and has been ratified by synods, cannot reasonably be made invalid by any one" 116). Pope Julius clearly sets before his eyes the authority of Nicea; the Eusebians must submit to that which, besides by customary law, was expressly sanctioned at this Council; they have no right to disapprove of the Pope's action and must recognize the decision of the Roman synod as legitimate and valid. After all that series of meetings in the thirties, this Roman synod in 340 is finally the first, after Alexandria in 338, that can properly be called a "synod"; and the first thing that this synod makes heard through the mouth of Pope Julius is an appeal to the General Council. Here the sublimity of Nicea is recalled by a synod which itself might almost be considered a general synod: under the presidency of the Pope, there were bishops present from various parts of the East and the West were not absent; however, for a real general synod the number of bishops was rather small and apparently the West only the Italian area was represented 117); this synod was therefore never considered ecumenical. Since the Eusebian legation, the Pope continues, had itself requested a synod, the Eusebians should have come to this council with all the more reason to be happy instead of showing their indignation. The Eusebians had written that every synod had authority and power and that it was an insult to the judge if his judgment was examined by another. Very well. But then consider who the synods hold in honor and who deprive the judgments of others of their power 118). "After the Arians were expelled for impiety by Alexander of blessed memory, the former bishop of Alexandria, they were not only publicly forbidden by every city, but also excommunicated by all who came together at the great Council of Nicea" 119). These now were received into communion by the Eusebians. Whom do the synods dishonor? "Are they not those who hold the judgment of the three hundred to be nothing?" And Marcellus, who resisted the Arians at the Council of Nicea, and Athanasius, whose guilt could not be proven either at Tyre or at Mareotis, they condemned. 120) The Pope then gives some concrete cases from which their association with the condemned Arians is evident; for example, their communion with the priest Pistus, who had been expelled "by the Council of Nicea" and was later consecrated bishop by a certain Secundus, who had also been condemned by "the great Council." Are they not rather guilty who despise "the great Council"? 121) "If, then, as you write, it is evident from the cases of Novatian and Paul of Samosate that the decisions of the synods must be and remain in force, then all the more reason should not be given to invalidating the judgment of the three hundred, then the Catholic Council should not be despised by any" 122). Who then will light the torch of discord? We, or on the contrary "those who ambitiously and contrary to the canon dissolve the judgment of

the three hundred and despise the Council in everything?" 123). Here the Pope touches on the critical point; the opponents of Athanasius are an oligarchy who claim to have the precedence over a council, which represents the whole Catholic Church. You should therefore have come to Rome to bring this question to a good end. Your excuses, that

57325 the appointed time is too short or the situation in the East does not permit it, are not valid 124). To the complaint of the Eusebians, that the letter of convocation of the Pope was addressed only to them and not to all the Eastern bishops, the Pope replies that the letter of convocation was a reply and therefore only sent to those who asked for a reply; the Eusebians. The Pope had not written to them, they

57330 believed, only in his own name, but they should know that his opinion was also that of "all in Italy" and of the bishops in those regions. "But I did not want to urge them all to write, because that would cause difficulty for many. But rest assured, at the appointed time the bishops met and they were of the same opinion, which I again make known to you by my letter; so that, beloved, you must know that this is the

57335 opinion of all, even though I write alone" 125). The Pope then shows that Athanasius and Marcellus were received into communion "not lightly or unjustly and without a form of trial" 126). Here Julius I also mentions the goodwill of "the great Council", that is, of Nicea 127) as well as the fact that "our priests, who were present at the Council of Nicea at that time" have now

57340 testified to Marcellus' orthodoxy 128). Incidentally, Athanasius and Marcellus were not the only ones who had filed complaints; many bishops and priests from Thrace, Coelesyria, Phoenicia and Palestine and also from Alexandria and all Egypt had done the same at this synod; especially there had come from Alexandria and Egypt, who testified that many bishops and priests had intended to attend the synod, but had

57345 been prevented from doing so: it was in Egypt a real persecution, and at Ancyra in Galatia it went no better 129). Who then stirs up discord? Let not the limbs of Christ be torn asunder. Even if Athanasius and Marcellus had been guilty, and with them all the other bishops and priests who were condemned or persecuted by the Eusebians, the Eusebians would still not have acted rightly. "For granted that, as

57350 you say, some fault could indeed be imputed to them, then the judgment should have been made according to the canon of the Church, and not in that way; all should have written to Us, so that in this way the right thing might be determined by all. Or do you not know that it is customary to write to Us first, and that in this way the judgment is pronounced here? If, therefore, any suspicion of that kind had fallen on the bishop of that city [Alexandria], they should have written to this Church [Rome]"

57355 130). However, the way the Eusebians acted is not according to the regulations of St. Paul, nor according to tradition, but something quite different and an attitude of their own invention. Finally, the Pope adjures the Eusebians to desist from their course of action and to disturb the Church no more. This important letter sheds a

57360 clear light on two things: first, that the Pope and his circle attached no value to the synod at Tyre and its continuation in Jerusalem, no matter how the Eusebians, and especially Eusebius of Caesarea, had expressed themselves about it; secondly, that the Pope and his circle recognized in a special way the authority of Nicea, to which they always appealed. Tyre-Jerusalem and Nicea are opposites. Emperor Constantine the

57365 Great had already begun to build a church at Antioch, which was called the great church or apostolic church, also called the golden church. Constantius finished the building and the consecration had to take place in a solemn manner. As was customary, such a ceremony attracted a large number of bishops and provided a fine opportunity to hold a synod. The consecration of the church at Antioch attracted ninety-seven

57370 bishops, who held a synod there between 22 May and 1 September of the year 341 131). Athanasius calls this synod expressly "ἐν xotc; 'EyKaivtoiq", "the synod of initiation", so that from the beginning it was always called "Antioch in Encaeniis" 132). Emperor Constantius himself was present at this synod 133). According to the testimony of Socrates, it was Eusebius of Nicomedia who had ensured that this synod

57375 took place 134) and Sozomenus also attributes the meeting to the influence of the Eusebians 135). Nevertheless, the Eusebians formed the minority, a third belonged to the moderates and the rest were entirely orthodox and Nicene. All the bishops were from the East; although the majority were from the Antiochene patriarchate, there also appeared Acacius of Caesarea in Palestine, Patrophilus of Scythopolis, Theodore

57380 of Heraclea, Eudoxius of Germanicia, Gregory of Alexandria, Dianius of Caesarea in Cappadocia, George of Laodicea in Syria, and Eusebius of Nicomedia, who was now bishop of Constantinople 136). Flaccillus of Antioch was probably president 137). Socrates and Sozomenus further mention that Maximus of Jerusalem refused to come, because he regretted having been deceived at the synod at Tyre six years before, and

57385 had been induced by the wiles of the Eusebians to sign the deposition of Athanasius 138). Socrates also mentions that Pope Julius was not present and had not sent anyone

to take his place: "while the canon of the Church forbids the Churches to establish canons without the will of the Bishop of Rome" 139). Sozomenus says that no one from the Italian area or from the other Western provinces was present either 140). "Since
57390 the assembled bishops were partly Eusebians, partly moderates, and partly fully orthodox, it is understandable that this synod was largely orthodox in its actions and decisions, and partly heretical or at least under the influence of heretical currents.

Twenty-five canons have been promulgated in Antioch 141). The promulgation bull
57395 begins with the following words: "The holy and most peaceful synod assembled by Goddess Antioch from the eparchy of Coelesyria, Phoenicia, Palestine, Arabia, Mesopotamia, Cilicia, Isauria, to the unanimous and holy priests in all provinces, salvation in the Lord" 142). The assembled point out that they are making known the canons "under the inspiration of the Holy and peaceful Spirit" 143) and "after much
57400 and careful investigation" 144). They trust that all will agree with them, ratify the decisions and confirm them "with the consent of the Holy Spirit" 145). The first canon deals with the feast of Easter and determines that all who dare to deprive "the decree of the holy and great synod assembled at Nicea" of its force must be excommunicated. Should anyone in the future dare to celebrate Easter at the same time
57405 as the Jews, this holy synod (at Antioch) will consider him a secessionist 146). While this canon can be attributed entirely to the influence of the orthodox party and perhaps also to that of the moderates, the fourth canon strongly suggests the influence of the Eusebians. For this canon determines that if a bishop, priest or
57410 deacon has been deposed by a synod and yet dares to exercise some ecclesiastical function, such a person cannot, according to the custom already in force, hope to be reinstated by another synod; such a person may not even expect to be given the opportunity to defend himself; the same applies to all those who continue in fellowship with such people. 147) This canon, according to the Eusebian view, is applicable to Athanasius and even to all who adhered to him; for, although deposed by
57415 the Synod of Tyre, Athanasius had nevertheless later exercised his episcopal office again in Alexandria, had defended himself before the Pope at the Synod in Rome, and had been recognized as innocent by this Synod and received into communion. The twelfth canon was also deliberately edited or renewed by the Eusebian party. It stipulates that when a priest or deacon, deposed by his bishop, or a bishop deposed
57420 by a synod, has complained about it to the emperor, he must bring his case before a larger synod, submit his complaints there and submit himself to the decision of this assembly; if, however, he does not take these legal means into account and continues to insist on the emperor, then he no longer deserves forgiveness, he no longer has the right to defend himself and he can cherish no hope of being reinstated. Another
57425 threat to Athanasius. For after his condemnation at Tyre he had sought refuge in Constantinopel and appealed to the emperor. Afterwards a large council had been held at Jerusalem, at which Athanasius had not been present and at which the decision of the synod at Tyre was implicitly ratified. And Athanasius was later restored to his seat in Alexandria through the mediation of Emperor Constantine II. But, thus
57430 Athanasius could defend himself with this canon, this provision is nevertheless from a few years after the events and so I can hardly be affected by it. Confident in the success achieved with this canon, the Eusebians went a step further. After the editing of the canons they asked for confirmation of the decree of deposition against Athanasius. Socrates testifies: "The Eusebians made it their main task to falsely
57435 accuse Athanasius, and in the first place of the fact that he had acted contrary to the canon which they themselves had then established, that he had in particular exercised the episcopal office again without the judgment of a common conference of bishops" 149). Sozomenus also says: "Many of them expressed their discontent and vehemently accused Athanasius of having despised the priestly law which they
57440 themselves had issued, and of having resumed the government of the Alexandrian Church before it had been permitted him by a synod" 150). The Eusebians therefore wanted to give these canons retroactive effect and thus checkmate the decision of Pope Julius and the Roman synod. Whether the decree of deposition against Athanasius was confirmed by this synod and, if so, whether all those assembled agreed to it, is
57445 difficult to determine with certainty. In any case, Socrates and Sozomenus made a mistake when they called Gregory the Cappadocian to this synod bishop of Alexandria and thus implicitly had Athanasius deposed by this synod; that appointment had already taken place at an earlier synod in Antioch in the year 339 151). Even if the orthodox bishops had confirmed a decree of deposition in 341, there is still no
57450 reason for surprise; after all the intrigues of the Eusebians, the chance of a clear and good insight and certainly also of a calm and mature judgment was almost impossible. In addition, the extreme Nicene Athanasius gave rise to suspicions of

Sabellianism, while his great friend and fellow-combatant Marcellus of Ancyra at least came very close to Sabellianism and used expressions that were difficult to reconcile with the doctrine of the Son of God as a Person. In this confused state of affairs, the orthodox bishops should not be bothered too much with a possible ratification of a decree of deposition 152).

The other canons of this synod do not give rise to the suspicion of different parties and it suffices to mention here that the ninth canon contains: "therefore it has pleased" 153), the tenth canon: "it has pleased the holy synod" 154), the thirteenth canon: "by this fact the holy synod declares him condemned" 155), and the fourteenth: "it has pleased the holy synod" 156); the sixteenth canon agrees with "complete, a complete synod" and itself gives the explanation of this term: "A complete synod is that at which the metropolitan is present" (157). The seventeenth and eighteenth canons also mention the complete synod (158).

The main characteristic of this synod, however, is that it inaugurated a new period in the Eusebian reaction to Nicea. At Antioch, it was no longer personal matters that were the centre of attention; the question of faith itself was given first place for the first time since Nicea. Three confessions of faith were submitted at this synod in succession. Here too, the various parties among those present made themselves felt, but the Eusebian influence was strongly restrained by the orthodox bishops.

The first confession of faith was brought to our attention in a circular letter, which opens with the words: "We are not followers of Arius, for how could we bishops be followers of a priest? Nor did we accept any other faith than that which was handed down from the beginning. In fact, because we had to examine and test his [Arius'] faith, we accepted him rather than followed him." 159) It is clear from this introduction that the Eusebian group, which had received Arius into communion, inspired this text and tried to justify itself here. They apologize, as it were, for having received Arius into communion; they do not want their name to be connected with that of Arius on that account, and they attach importance to declaring that their beliefs agree with the old traditional faith. 160) And to prove this last assertion they follow up with a confession of faith. The contents of this confession are described by Sozomenus in the following words: in this formula no mention is made of the subsistence of the Father or of the Son, nor of the term *ὁμοουσιος*; . The same author gives his judgment by saying that the meaning of this confession was so ambiguous or neutral that neither the Arians nor the followers of Nicea could bring an accusation on the basis of the expressions used; terms that were foreign to the language of Holy Scripture were not in it; the expressions that both parties rejected had been passed over in silence on purpose and those that both parties accepted had been included 161). This confession may therefore not be called heretical; it can be explained entirely in an orthodox sense. But why not simply accept the formula of faith of Nicea? Because that was impossible for the Eusebian group without condemning their own opinions. By the given confession, however, the Eusebians hoped to be recognized as orthodox, while, precisely because this confession remained outside the points of contention, they believed that they could hold on to their own views. Moreover, they cherished the hope that a new confession would supplant the criticized Nicene with its specific *ὁμοοὐσιώσιος*; . Thus a, literally speaking, neutral confession of faith came into being in circumstances that were extremely serious for the life of faith, because heretical views were gaining more and more influence and Nicea was increasingly and directly attacked. Nicea found itself in serious danger and here in Antioch had the Eusebians managed to set a questionable precedent; in the future this precedent would be followed with pleasure and repeatedly and new formulas of faith would be issued at the expense of orthodoxy. The tendency of the Eusebian endeavour is indicated by Socrates in the words; "They did not change the creed in any [open] disapproval of what had been established at Nicea, but in reality they did so in order to undermine and modify the belief in the *οὐσιώσιος*; because by their actions they gave cause to continually hold synods and to issue a different definition of faith, so that in this way they gradually turned towards the Arian view 162); Athanasius also judges that the endeavour of the Eusebians was aimed at making heresy gain ground 163). The first formula apparently did not satisfy the assembled. The sources say that they regretted it and that they invented new and different things 164). A second, extensive confession of faith was issued. This is indeed the official formula of the synod and will for many years be explicitly regarded as the only true confession of Antioch in Encaeniis. This formula is rightly attributed to Lucian of Antioch who died as a martyr in 312 165). The confession is directed against the Sabellian views, of which Marcellus of Ancyra had been openly accused and Athanasius had been seriously suspected by several, including orthodox ones 166).

This formula also has nothing positively heretical. St. Hilary even does his utmost to demonstrate its orthodoxy, notwithstanding that, -- even in his opinion, less correct expressions could be cited and the word *ὁποσοῖοι* is missing 167). This concealment of the *ὁποουαι*oc; is indeed the greatest error which adheres to the confession. A third formula is explicitly directed against the Sabellians, while Marcellus of Ancyra is also explicitly mentioned as a supporter of this heresy. According to Athanasius, Bishop Theophronius of Tyana composed this confession, presented it to the assembly, and all accepted the confession as orthodox declared and signed 168). With this the work of this synod was ended 169).

In the meantime the emperor of the West, Constans, had asked his brother Constantius for information about the attitude of the Eastern episcopate. In order to comply with this request, probably at the beginning of 342, four bishops, namely Narcissus of Neronias in Cilicia, Maris of Chalcedon, Theodorus of Heraclea and Marcus of Arethusa in Syria, went from Antioch to the court at Trier. They brought with them a new confession of faith, which is usually called the fourth formula of Antioch, but has nothing to do with the synod 170). This formula is also anti-Sabellian and is closer to the confession of Nicea than the first Antiochene formula; the term *ὁγοῦῶ*aioc; is however also missing here. This was probably drawn up by the Eusebians, because it offers even more opportunity than the others for subtle and abundant hair-splitting 171) and the Eusebians hoped that the West would regard this formula as the faith of the whole East.

Due to the presence of various influences at this synod it is understandable that posterity had a non-uniform appreciation of it with respect to Antioch in Encaeniis 172). The canons have acquired a high esteem in the Church, so that they have also been preserved in numerous manuscripts. Two of these canons, the fourth 173) and the fifteenth, were quoted by the Fourth General Council, at Chalcedon in 451, under the name: canons of the holy Fathers 174). Pope John II sent these two canons in 534 to Caesarius of Arles to make use of them in the matter with Bishop Contumeliosus 175). The ninth canon was placed by Pope Zacharias, in a letter to Pepin the Short and the clergy of the Frankish kingdom, among the canons of the holy Fathers, established by the Spirit of God and confirmed by the reverence of the whole world. 176) At a synod, held in Rome in 853, all those present, at the suggestion of Pope Leo IV, gave the following testimony: "We could do no better than judge and repeat what the holy Fathers at the Synod of Antioch in the third chapter [that is, the third canon] promulgated and established inviolably." 177) St. Hilary wrote that "the synod of saints" composed various formulas of faith 178). Sozomenus, on the other hand, viewed the synod from the other side. He had this synod meet at the instigation of the Eusebians: "ostensibly as if to consecrate the newly built church; as the outcome showed, however, to change the decrees of Nicea." 179) And when the unjust deposition of John Chrysostom was confirmed by appealing to the fourth canon, St. John called this canon "not a canon of their church, but of the Arians; for those who had assembled at Antioch to tear down the faith of the "*ὁποooooooooi*oc" issued this canon out of hatred against Athanasius" 180). Likewise Sozomenus testifies that John Chrysostom called this a "law of heterodoxes" and that the Arians had established this law 181). Pope Innocent I (402-417) wrote on this matter in a letter to the clergy and people of Constantinople that one must obey only the canons of Nicea; canons that deviate from it and are composed by heretics are rejected by the Catholic bishops; these canons are to be condemned at the same time as the heretical and schismatic doctrines, as the synod of Sardica already did 182). Most probably the synod of Gangra, the metropolis of Paphlagonia, must be placed around the year 340 183). From the reports of the historians Socrates and Sozomenus and from the data in the synodal letter it appears that this synod was directed against the leader of the semi-Arian fraction Eustathius of Sebaste in Lesser Armenia or even more against various unauthorized practices of Eustathius' disciples 184). The thirteen bishops at this synod 185) issued twenty canons, which condemn the various practices and opinions of the Eustathians. These twenty canons, which all begin with "if anyone" and end with "let him be accursed" 186), contain nothing special for this investigation 187). In the synodal letter, which gives a summary of the contents of the twenty canons, the synod already calls itself in the address the "holy synod of Gangra" 188); immediately after that "the most holy 189) and at the end, before giving the canons themselves, twice "the holy synod" 190). For the sake of clarity, the synod concluded its canons with an epilogue, intended to prevent misinterpretations of these decrees 191). However, the epilogue does not offer any details regarding this investigation; each time it speaks of "we without further ado: we write, we feel admiration, we accept, we admire, we value, we do not despise, we praise, we reject, we honor, we have lyre, we approve, we have praise, we wish 192).

The Eusebians must have considered it presumptuous to go directly against the General Council of Nicea and its creed. They chose a more cautious tactic, which, they hoped, would be equally effective: to neutralize the advocates of Nicea, first of all to foremost and most vigorous defenders of orthodoxy, such as Athanasius of Alexandria, Eustathius of Antioch, Marcellus of Ancyra, and Paul of Constantinopel. In carrying out their plans, the Eusebians sought to overthrow these persons into discredit, but not by immediately bringing an accusation concerning their doctrine, for this would have meant an accusation against the Nicene faith and would have exposed too clearly the aim of the Eusebian endeavour. Immoral acts, invalidity of the election or consecration of a bishop, political crimes and the like were the accusations which they embraced, even though they were aware of the total falsity or far-reaching exaggeration of these accusations. Only Marcellus of Anya could be accused with any justification of Sabellianism or the use of Sabellian expressions. The Eusebian tactic was only too successful; bowed down by the gravest suspicions, Athanasius, Eustathius, Paulus and many others with them had to take the road to exile. It was not until 341, when the Eusebians saw the successes already achieved being undone by Rome and the West and the exiled Niceans having been accepted into communion by a synodal decision, that they tried it with the question of faith itself: a new creed had to supplant the Nicene creed with all its hatred. However, they apparently did not dare to make an open protest against the Nicene faith, a protest such as the followers of Nicea directed against everything that was not Nicene. After all, by openly opposing Nicea, they would openly and definitively exclude themselves from the Church and they wanted to avoid that; they wanted to be regarded as Catholics. They understood that for that they had to submit themselves, at least in appearance, to Nicea, since this was a General Council, a council at which the entire Church had defined the Catholic faith. Without this submission they would fall into the position of heretics or excluded. Their reaction against the General Council could therefore not be anything other than a side-line reaction.

In sharp terms, the Catholic synod at Alexandria in 338 condemned the actions of the Eusebians, who were led by Eusebius of Nicomedia and Theognis of Nicea, against Athanasius. Eusebius and Theognis were not able to depose another bishop, in this case Athanasius. After all, they no longer possessed any power, because they themselves had been deposed and rejected on the basis of what was determined at Nicea at the "ecumenical synod", a council "in the true sense of the word, elevated above synods such as those at Tyre and Jerusalem, which are not real synods, but only conspiracies. A real synod is a meeting of bishops who defend and make known the truth and indeed as independent judges of themselves, independent of all extra-ecclesiastical influences; worldly dignitaries, even the emperor, may not take a leading position at the meetings, church officials such as deacons must assist the bishops, with soldiers or imperial officials. Two years later, Pope Julius outlined the authority of the ecumenical synod. After investigation, the Bishop of Rome admitted Athanasius, who had sought justice from him, into communion and to all who seek justice from the Pope, justice will be done. The Pope is not obliged to endorse without investigation the judgment of particular synods, however great they may be. A definitive judgment is given only by that synod at which the entire episcopate of the Catholic Church is represented. And therefore the Pope can rightly appeal to "the great Council of Nicea" to justify his actions; for "not without God's will" this council permitted the proceedings of an earlier synod to be examined at another (193). And a decision of Nicea is the decision of the entire Catholic episcopate and therefore definitive, always and everywhere binding. The Eusebians must also submit to a decision of Nicea on pain of loss of catholicity. This is the judgment of the Roman synod of 340, that is to say, of the Pope and of more than fifty bishops from East and West. The Pope supplements this positive argument with an argumentum ad hominem. The Eusebians may not reproach the Pope and the Roman synod with making synodal decisions powerless and worthless. For it is precisely the Eusebians who dishonor the synod by not recognizing the judgment "of the three hundred," "of the great Council of Nicea." If one must recognize one synod, it is the Synod of Nicea, and whoever despises the Synod of Nicea cannot have respect for any synod; for Nicea is "the Catholic Council" and as such stands above all councils that have ever been held, above Tyre and Jerusalem, above the councils of the eleventh century against Novatian and Paul of Samosate. Nicea is "the holy and great" synod, as the first canon of Antioch 341 says. This last synod, that of Antioch, is also convinced that it has drawn up its canons "under the inspiration of the peaceful and holy Spirit", which does not alter the fact that the drawing up of these regulations was preceded by a "careful and repeated investigation". Synods increasingly call themselves "the

holy synod". The orthodox synod at Alexandria in 338 does so in the address of its synodal letter 194), Antioch in Encaeniis up to four times in its canons 195), while in the promulgation bull it speaks of "the holy and most peaceful synod" 196). The synod at Gangra even calls itself once "the most holy synod" in its synodal letter 197). It is indeed distressing that an untrue synod like Jerusalem 335 dares to also claim the title of "holy synod" in the address of its synodal letter and once in the corpus thereof 198). Constantine the Great does the same with regard to the synod at Tyre, when he writes the address on the letter addressed to it; in the letter itself, however, Constantine uses the term synod without further ado 199); the clergy of Mareotis also write in the address of their protest letter to the same synod "the holy synod of blessed bishops" 200), so that one may conclude that this designation is already understood as a stencil; however, the same clergy does not use this title when they speak about Tyre in a letter to the imperial officials Philagrius and Curiosus 201). Moreover, the terminology used in the sources remains simple. All the various synods after Nicea are called "synods" without further ado, while Theodoret and Philostorgius have a special predilection for the word "ouvé&piov", which term Socrates uses once for Constantinopel 338 202). The lyric, which a partisan like Eusebius of Caesarea uses with regard to the synod at Jerusalem 335, can be left out of consideration. Among the many texts only Nicea receives the name of "ecumenical" synod, the catholic or general 203). Nicea is also the great synod 204) or the holy and great synod 205).

For concepts such as calling together 206), coming together 207), holding a synod 208) and gathering 209) one finds the usual terminology. As far as calling together is concerned, it has been pointed out several times that this was often done by the emperor.

CHAPTER IV THE COUNCIL OF SARDICA IN 343-344

Once again banished from the East, Athanasius stayed in Rome. There, after three years, in April or May 342, he received a letter from Emperor Constans, who summoned him to Milan. Some bishops, including Pope Julius, Ossius of Cordova and Maximus of Trier 1), had asked Constans to mediate with Constantius to have a synod held in Sardica 2), at which the points of contention concerning Athanasius were to be definitively resolved 3). Constans received a similar request from followers of Paul, the legal and orthodox, but also expelled bishop of Constantinopel, as well as from followers of Athanasius; they demanded that "an end be put to these personal matters as well as to the questions of faith at a general synod 4). Emperor Constans conveyed this request to his brother, and both decided to hold a synod. "There was thus again a convocation of a general council at Sardica, a city of Illyria, according to the decision of the two emperors, one of whom had requested it by letter, the other, namely that of the East, had willingly consented" 5). With this testimony of Socrates is that of Sozomenus agrees: "It pleased both emperors that the bishops of each of the realms would meet in Sardis on the appointed day" 6). A General Council (Socrates) as a council of the two parts of the realm, East and West (Sozomenus). The synodal letter also bears witness to the fact that the emperors convened this synod "with the assistance of God's grace" and that they permitted this "holy synod" to be held 7). St. Athanasius also repeatedly testifies to this course of events 8). The initiative for this council came from various bishops, among whom was the Pope; the emperors called it together with the intention that it should be a "General" Council, a council of East and West, on which they also assigned both the Eastern and Western bishops. When Socrates and Sozomenus place the Council of Sardica during the consulate of Rufinus and Eusebius in the eleventh year after the death of Constantine the Great, that is, after 22 May 347, they are mistaken 10). The starting point falls in the second half of the year 343 and the end point probably in the spring of 344. The twofold purpose of this meeting is stated in the synodal letter of the council itself as follows: "so that all differences of opinion may disappear, all errors of faith may be banished, and only the true cult of Christ may be maintained by all and "especially because of what they [the Easterners] repeatedly related about our beloved brothers and colleagues, Athanasius, bishop of Alexan, and Marcellus, bishop of Ancyra in Galatia".

Elsewhere this council mentions as the three questions dealt with: the restoration of the true faith, which had been violated by several, the question of the deposition of several bishops, and the acts of violence against bishops, priests and other classes of clergy 14).

From the East and West 15) at the very favourably situated place Sardica many bishops came together. The Eusebians feared the judgment; however, with the support of the two imperial officials they brought with them, Musonianus and Hesychius, they

trusted, as usual, that they would win the case 16). "But as soon as they perceived that it was a purely ecclesiastical justice without count and soldiers, as soon as they saw the accusers of each Church and city and the evidence against them" they became confused 17). The number of participants of each party is difficult to determine precisely. The Eusebians, or more generally the Easterners, say in their synodal letter that they came to Sardica with eighty bishops 18). But only seventy-three, or rather seventy-two, signed this letter 19); but it is evident from the same letter that besides these seventy-three, Maris of Chalcedon, Macedonius of Mopsueste and Ursacius of Singidunum were also present 20). So then there would have been seventy-six, which number is given by Socrates 21) and Sozomenus 22). Socrates explicitly states that he is relying here on Sabinus, bishop of Heraclea in Thrace, a semi-Arian, who probably wrote a treatise on councils in the time of Emperor Valens, which was later lost 23). The principal participants of the Eusebian party were, besides the three already with named, Valens of Mursa and Theodore of Heraclea, five of whom had belonged to the committee sent to Mareotis by the synod of Tyre 24); furthermore the new bishop of Antioch, Stephanus, Menophantus of Ephesus, Acacius of Caesarea in Palestine, Marcus of Arethusa, Eudoxius of Germanicia and Basil of Ancyra. They were joined by Dianius of Caesarea in Cappadocia and Ischyrras of Mareotis.

It is more difficult to determine the number of orthodox or Western bishops. According to Socrates and Sozomenus the number of Westerners was about three hundred 25). Socrates adds that Athanasius gives this number. Athanasius, however, says that more than three hundred bishops "agreed" to the decisions of Sardica 26). In the same Apologia contra Arianos Athanasius takes up the synodal letter of Sardica and follows it with the names of two hundred and eighty-four bishops, among whom was Pope Julius "by means of the priests Archidamus and Philoxenus" 27); but before giving this list of names Athanasius says: "This letter was also sent by the synod of Sardica to those who had not been able to come; and they also declared that they agreed with the decisions." The names of the signatories at the synod and of the other bishops are given below 28), and after the list Athanasius adds: "These then are those who signed the letter of the synod; then there are very many others, who also wrote in my favor before this synod from Asia and Phrygia and Isauria, and their names are in their own letters, among the three and sixty, all together three hundred and forty-four" 29). These numbers do not therefore indicate the number of participants at the synod; on the other hand, among these names are not those of Euphratas of Cologne 30), Marcellus of Ancyra and a certain Olympius 31), who were certainly present at the synod. Elsewhere Athanasius says that from the East and West about one hundred and seventy bishops were present 32). According to the context, this number also includes the Eusebians 33); if, however, they were not included and their number were counted at eighty, the total would be two hundred and fifty, the number given by Theodoret 34).

In any case, the number of bishops was respectable; it can be safely estimated at a hundred and seventy or eighty, of whom eighty were Eusebians and therefore almost a hundred orthodox. On the basis of the various documents with signatures 35) and other historical data, the Ballerini brothers were able to compile a list of ninety-seven orthodox bishops who were present at the council 36). Of these, six were from Spain, two from Gaul, four from Africa, eight from Italy, three from Illyria, nine from Dacia, thirty-three from Macedonia with Crete, four from Thrace, one from Asia, one from Pontus, three from Syria, one from Egypt and twenty-one from unknown regions, among whom there must have been several from Egypt 37). Of the West, only Britain was not represented.

Pope Julius had himself replaced by two priests, Archidamus and Philoxenus and the deacon Leo 38). The synodal letter to the Pope says: "You, therefore, most beloved brother, were indeed physically absent, but present with the will and in the spirit of concord and your apology for your absence was praiseworthy but also necessary, so that the schismatic wolves could not commit theft and plunder by cunning and ambush, or the heretical dogs inflamed with fury would not bark senselessly or the devilish serpent would not vomit his blasphemous poison" 39). Whether the sentence immediately following this is genuine, one can reasonably doubt. It follows in particular: "We consider this to be good and entirely proper, that the priests [bishops] should report to the Head, that is, to the Chair of the Apostle Peter, concerning every province of the Lord." 40)

Ossius of Cordova, who had left Gaul for Sardis at the same time as Athanasius 41), took over the presidency and as such he proposed the canons 42) and was the first to sign the council documents 43). Athanasius expressly says: "the holy synod, of which the great Ossius was president" 44), after having previously written that "the

Western [i.e. orthodox] bishops were alone with their father Ossius 45). In a similar manner Theodoret writes: "This Ossius was bishop of Cordova and had shone at the great synod at Nicea and had taken the first place among those assembled at Sardis" 46). Sozomenus calls the orthodox party "the Ossians" 47) and writes further: "Ossius and Protogenes [of Sardica], who were then in charge of the Western assembly at Sardica" 48). The Eusebians also regard Ossius and Protogenes of Sardica as the leaders of the orthodox 49). In the same spirit Socrates speaks of Protogenes and Ossius 50).

Besides Ossius of Cordova there were also from Spain Amanus of Castulo 51), Castus of Saragossa, Domitian of Asturia, Bloquentius of Emerita and Praetextatus of Barcelona. Gaul was represented by Verissimus of Lyons and Maximus of Trier; Italy by Protasius of Milan, Severinus of Ravenna, Januanus of Beneventum, Fortunatianus of Aquileia, Lucius of Verona, Sterconius of Apulia, Ursacius of Brescia, and Vincentius of Oapua. Among the great number of bishops from Macedonia and Achaia were Athenodorus of Platea, Dionysius of Elis, Hermogenes of Sicyon, and Plutarchus of Patras. Asia had sent as its orthodox bishop Diodorus of Tenedos. The three accused Athanasius of Alexandria, Marcellus of Ancyra, and Asclepas of Gaza in Palestine were also present. According to Socrates, Paul of Constantinopel was also present as an accused 52), but this is contradicted by the synodal letter of the Eusebians: "through Asclepas they [the orthodox] held communion with Paul and they received letters from him and they sent them to him" 53).

Before going to Sardica, where the orthodox were already, the Eusebians held a meeting in the nearby city of Philippopolis; from here they wrote to the Fathers at Sardica, that they should expel Athanasius from the council and break communion with him, because he had been deposed from his episcopal office. When they arrived at Sardica they refused to set foot in the church where the meetings were to be held, as long as Athanasius, Marcellus and Asclepas were present 54). The Eusebians could not reinstate them in the episcopal office, because that would mean an infringement of an ancient tradition and this power the Church did not grant to itself and had not received from God; faithful to the divine laws, to tradition and to the ecclesiastical regulations they had never yet received anyone who had once been condemned. "And therefore, we have never shaken anything that is indissolubly established: but rather maintained that which was determined by the Fathers 55). They then called meetings on their own occasion and had managed to force their adherents under threats to promise not to attend the orthodox meeting or prevented the well-intentioned from going there. At Sardica they stayed together in a house, the Palatium, and did not allow anyone to isolate himself. And two of them, Macarius (also called Arius) from Palestine and Asterius from Petra in Arabia, were able to avoid this forced isolation to escape; they went to the Orthodox and reported the conduct of the Eusebians 56). These two bishops had to pay for this after the council with their exile in Libya, where they were sent by Emperor Constantius" 57). Indeed, the Eusebians could well have been afraid, since an impartial investigation was being held in Sardica, independent of imperial officials, and where there were several bishops and priests who could testify to their misdeeds; chains and fetters were even produced as evidence 58).

Of course, the Eusebians themselves gave a representation of the course of events that was more to their advantage. According to them, Athanasius, after the death of several accusers, witnesses and judges, would have driven the Pope, Ossius, Maximus of Trier and other bishops to bring about the Council of Sardica. Out of respect for tradition and the council decisions, the Eusebians had ordered Ossius and Protogenes to remove Athanasius, Marcellus and other condemned bishops. After that, the Eusebians would, together with the orthodox to investigate what sentences these bishops had undergone in the past. Apparently the Eusebians denied Sardica the right to revise the sentence of Tyre and Antioch. But since the orthodox persisted in their communion with these sinners, the Eusebians burst into tears; they could have no part in the holy mysteries with profane men, and it was impossible for them to hold court with men who had been condemned by their predecessors. The Eusebians had repeatedly requested not to trample on divine laws, not to neglect ecclesiastical tradition, not to cause a new schism, or not to despise the Eastern bishops and the most holy synods. But these Westerners ignored all this, threatened us, and promised to avenge Athanasius and the other criminals. As if they could have said and done anything else, those who received all criminals and reprobates into their communion. They carried their presumption so far as to set themselves up as judges over the judges, and to try to overturn the judgment of those who were already in communion with God. While both parties were thus disputing, the five remaining members of the committee that had once been sent to Mareotis had proposed, so the Eusebians always did, to

57850 send some bishops from both parties to the places where Athanasius had committed his infamies. Should this embassy come to the conclusion that they, the five members of the committee, had made a false statement, then they would consent to their own condemnation; but if they had given their report truthfully, then the orthodox delegates of this new committee would have to be excluded from the community, as well as all the supporters and defenders of Athanasius and Marcellus. Ossius, Protogenes and their followers would have recoiled from this proposal. After a long series of accusations against the Fathers, the Eusebians wrote that the orthodox had wanted to intimidate them with the imperial letters in order to force them to join Ossius and Protogenes. Thereupon the Eusebians decided to return to their homeland and, before leaving Sardica, to inform Christendom in writing of what had happened. 59)

57855 The orthodox would have liked to see the Eusebians appear at their council; they had also repeatedly invited them and warned them not to withdraw, as this would be the principal evidence against them. For from this one might rightly conclude that they could not prove their accusations against Athanasius and the other bishops and that they had therefore been false accusers; as such the council would have to brand them in that case 60). Athanasius, Marcellus, Asclepas and many others, on the other hand, were present and prepared to refute every accusation and to prove the crimes of the Eusebians. The Eusebians chose flight 61), by which they acknowledged their shameful conduct. Ossius himself testifies to his accommodating attitude towards the Eusebians in a letter to the Emperor Constantius. "When the enemies of Athanasius came to the church where I usually stayed, I myself invited them to speak, if they had anything against him. I solemnly assured them that they might rest easy, and promised that they could expect nothing but an impartial tribunal in all respects. And this I did not once, but twice, adding that if they would not do it before the whole synod, they would at least do it before me individually. I also promised that if he were found guilty, he would undoubtedly be expelled by us; but that if Athanasius were found innocent and proved their fraud, and they nevertheless rejected him, I would try to persuade him to go with me to Spain. Athanasius also accepted these conditions without a word of protest; but they had no hesitation in no good head in it and refused to go into this also" 62). Athanasius also mentions that the Eusebians preferred the shame of flight to the shame of being openly denounced as impostors; and that if they were convicted at Sardica the emperor would not have them expelled from their churches 63). Before leaving the council city the Eusebians sent Eustathius, a priest of Sardica, to the orthodox with the message that they had received a letter from the emperor, in which his victory over the Persians was mentioned; they were therefore obliged to go and congratulate the emperor. Seeing through this subterfuge, the synod immediately replied: "come here to defend yourselves against the charges brought against you and to cleanse yourselves of the frauds you have committed, or else; know that the synod condemns you as guilty, the Athanasians .on the other hand will declare free and pure from all guilt" 64). During the night the Eusebians left.

57885 With this the orthodox could have considered the matter settled and declared Athanasius and the other accused innocent without further ado. However, in order that the Eusebians would not use their flight as a new pretext for further intrigues, the assembled decided to re-examine the whole affair and to examine all the documents in order to bring the truth to light. It then turned out that Athanasius had been falsely accused of murdering Arsenius; Macarius, the priest of Athanasius, falsely accused of breaking a chalice. The council received the full information from several Egyptian bishops who were present at Sardica, as well as from the letter which eighty Egyptian bishops had at that time sent to Pope Julius 65).

57900 The council then considered the accusations against Marcellus of Ancyra. The book written by Marcellus was read. The Western bishops were not sufficiently versed in all the subtleties which a dialectician of Greek speech could develop. With too much indulgence they declared that the impugned passages were written more in hypothetical form to express a doubt than as defended propositions; they therefore judged Marcellus' doctrine to be fundamentally orthodox. 66) A third accused was Asclepas of Gaza in Palestine, who had been deposed by the Eusebians at Antioch. Asclepas produced the acts of the synod at Antioch and proved his innocence by the words of his own judges. 67) It also appeared that the Eusebians had not only received into their community some persons who had been condemned for their Arianism, but had even promoted them to a higher ecclesiastical rank; certain acts of violence by the Eusebians could be established 68). The council judged Athanasius, Marcellus, Asclepas and their followers, among whom in particular the Alexandrian priests Aphthonius, Athanasius, the son of Capito, Paulus and Plution 69) innocent and sent a

57915 letter to each diocese with the admonition to acknowledge their innocence and to
 receive them as bishop. However, those who had invaded the Churches like wolves,
 namely Gregory in Alexandria, Basil in Ancyra and Quintian in Gaza, were not to be
 named bishops and were not to have any communication with them. The "holy synod
 57920 declared with unanimous consent" Theodore of Heraclea in Thrace, Narcissus of
 Neronias, Acacius of Caesarea in Palestine. Stephen of Antioch, Ursacius of
 Singidunum, Valens of Mursa, Menophantus of Ephesus, and George of Laodicea in Syria
 were deprived of their episcopal dignity because of their Arianism and crimes
 committed; they were also to be excluded from the ecclesiastical community become
 57925 Patrophilus of Scythopolis; in this, however, Athanasius seems to be mistaken 71).
 Theodoret also seems to be guilty of an anachronism when he relates that Maris,
 Valens and Ursacius asked forgiveness from the council after they had acknowledged
 their partiality in the investigation at Mareotis 72); two of them, namely Valens and
 Ursacius, only took a similar step later. The council Fathers also informed the
 57930 emperors of their decisions 73).
 The task of the council also included banishing every error concerning the faith and
 restoring the true faith in all its glory. According to Athanasius, some bishops in
 their rashness proposed at the council to issue a formula of faith, as if there were
 something lacking in the Symbol of Nicea; "but the holy synod at Sardica was
 57935 indignant at this and determined that nothing more should be written about the faith
 and that the formula of faith composed by the Fathers at Nicea was sufficient, since
 it left nothing to be desired, but was full of piety. And the synod determined that
 no other formula of faith should be issued, so that the one at Nicea would not be
 considered imperfect and no pretext would be given to those who wanted to write and
 57940 define the faith all the time" 74). The council of Sardica thus clearly saw through
 the efforts of the last years to undermine the Symbol of Nicea by means of new
 formulas of faith. The Fathers at Sardica considered Nicea inviolable and perfect.
 Nevertheless, soon after the council a confession of faith was in circulation which
 was wrongly attributed to Sardica. Athanasius and the bishops gathered around him
 57945 declared this formula to be spurious and false in Alexandria in 362 75). Eusebius of
 Vercelli, who was also present at this council in Alexandria, signed the acts in
 Latin and in his signature also condemned the pseudo-Sardica formula; only the Nicene
 was to be considered the true confession and it was not necessary to add anything to
 it. The text of this signature has been preserved by Athanasius 76).
 57950 At the end of the synodal letter of Sardica to the entire Church, Theodoret gives a
 copy of this confession of faith 77). This confession of faith is probably intended
 as an explanation of the Nicene symbolum; it therefore has an orthodox meaning and
 contains, besides the positive part, a refutation of the Arian conception of the
 Father and the Son. In the Historia Tripartita one finds a Latin translation by
 57955 Epiphanius Scholasticus 78). Sozomenus mentions this formula as an "enlargement of
 that of Nicea," but with the same meaning and not differing word for word. He then
 relates how Ossius and Protogenes testify in a letter to Pope Julius that they had
 ratified this formula; for fear that some would detract from the Nicene decrees, they
 had composed this somewhat more detailed confession in order to prevent the Arians
 57960 from abusing the brevity of the Nicene formula 79). This report of Sozomenus has been
 confirmed by a discovery by Scipio Maffei in the eighteenth century. In the library
 of his birthplace Verona he found an old Latin translation of almost all the acts of
 Sardica. The brothers Ballerini and also Mansi published these documents and among
 them one indeed finds a short letter from Ossius and Protogenes to Pope Julius, which
 57965 agrees with the table of contents given by Sozomenus. Ossius and Protogenes sent the
 confession of faith to the Pope "so that no criticism would be made of their conduct"
 80). The council of Chalcedon in 451 probably had this formula of faith in mind in
 its allocation to Emperor Marcian 81). The Latin translation of the text has been
 preserved in the Verona manuscript 82); in general, however, the Greek text in
 57970 Theodoret at the end of the synodal letter is better 83).

The apparently contradictory data of Athanasius and of the letter of Ossius and
 Protogenes to Pope Julius can be reconciled with the Ballerini thus: the confession
 proposed by Ossius and Protogenes did not receive the official approval of the
 57975 council; nevertheless, the confession and the letter about it to Pope Tullius were
 later included in the collection of acts of this synod; soon both documents were
 wrongly regarded as official synodal documents; the Council of Chalcedon must also
 have made this mistake. Is it not surprising then that Athanasius speaks of the
 rashness of some bishops? The wise, high-minded and generally respected Ossius and
 57980 his co-president Protogenes can hardly have been considered rash by Athanasius.

Perhaps there were some bishops who more or less rashly insisted on the promulgation of a formula of faith and this trend was the reason for Ossius and Protogenes to make an attempt in that direction. In that case the qualification of rashness does not apply to Ossius and Protogenes and on the contrary one sees an example of their policy and tact not to suppress this trend without further ado on the one hand and not to urge their proposed formula as chairmen against the majority on the other hand; their tact knew how to guide the trends into the right channel and thus to settle the issue without discord. According to the introduction to the Easter letters of St. Athanasius, the Council of Sardica also dealt with the Easter question, which had not yet been completely resolved by the Council of Nicea. For a period of fifty years, the same day for celebrating Easter was established at Sardica for the Roman and Alexandrian Churches 84); only a *modus vivendi*, therefore, not a solution on principle. In his Eastern Letter of the year 346, St. Athanasius, with reference to this council, establishes the Easter festival for the Egyptian Church not on the 27th Phamenoth, but 8 days later on the 4th Pharmuthi 85). After the threefold task had been fulfilled by the synod, the Fathers were still occupied with church discipline and issued a series of canons. Of these canons, there is a double, official version, a Latin one for the West and a Greek one for the East. In the history of the Church, this is the first fact of an official bilingual document. From this date on, the division between East and West took place more and more, also in the area of language.

By the bilingualism of Sardica the distance between East and West was not only officially announced or established, but even more so, as it were, sanctioned. It was clear that from now on one had to take into account a dual Christianity, of which the two parts had different interests, different concerns and also different languages 86). A symbolization of the distance between the two parts of the Church can be seen in the fact that the Orthodox met in the church at Sardica, while the Eusebians held their meetings in the Palatium and later left Sardica for Philippopolis; in the sources both parties are indicated respectively as Westerners and Easterners, although there were several Eastern bishops among the Orthodox. Socrates already describes the situation very aptly in the following words: "The West was now torn away from the East and there was a dividing line [ὄρος] between their mutual intercourse, namely the mountain [ὄρος] Tisoukis 87), which lies between Illyria and Thrace; in the immediate vicinity of this mountain there was a common mutual intercourse, although there was a difference of faith; between the more extensive areas, however, there was no mutual intercourse 88). Such a confused state of affairs then prevailed in the Churches" 89).

The Greek text of the canons has been handed down by John of Constantinople (fifth century) and by various manuscripts, the original Latin text in the three most famous Western canon collections, the *Prisca*, that of Dionysius Exiguus and that of Isidore of Seville 90). The following words introduce the canons: "The Holy Synod of Sardica, assembled from the various eparchies, has established the following" 91). Ossius of Cordova first makes a proposal and asks whether it pleases everyone, to which he replies "all the bishops" answer: "it pleases all" 92). This first canon is apparently directed against the Eusebians, to whom Pope Julius had already reproached that their bishops changed diocese so often out of desire for rich bishoprics; this practice had already been forbidden by the fifteenth canon of Nicea. The second canon, also directed against the Eusebians, is, like the first, a proposal by Ossius and formulated in the same way. The same applies to the third, fourth and fifth canons, which together form a unity and establish the principle of the appeal to Rome 93): the fourth canon, however, is a supplementary proposal by Bishop Gaudentius of Naissus in Dacia to the proposal of Ossius in the third canon. From the sixth to the thirteenth 94) each canon also contains a proposal by Ossius, which is approved by all. According to the Greek version, Ossius expresses his concern in the fourteenth canon about a priest or a deacon who would be the subject of a rather impetuous bishop and would be excluded from the community by him; all the Fathers of Sardica together then indicate how such a case should be solved. According to the Latin version, where it is the seventeenth canon, Ossius himself indicates the line of conduct to be followed. In deviation from the still existing Greek text, in the Latin version a proposal by Bishop Januarius of Beneventum in Campania follows as the eighteenth canon; all accept this proposal 95). In the fifteenth canon (Greek) one sees the same as in canons 6-13. The sixteenth canon offers a case brought up by Aëtius of Thessalonica in connection with the eleventh canon, for which special case Ossius then gives the application of the eleventh canon in the name of all. In the seventeenth canon Ossius takes over a proposal from Olympius of Aenus in Thrace and

this is also accepted by all. In the Latin version, where this is the twenty-first and last canon, the signatures follow. The eighteenth and nineteenth canons contain a proposal from Bishop Gaudentius, which is taken over and more sharply defined by
58050 Ossius and accepted by all; since they relate exclusively to the Church of Thessalonica, it is not surprising that these canons are absent from the Latin version. Again, the twentieth and twenty-first canons 96) form a unity, in which also a proposal from Gaudentius is approved by all. In the Latin version, a decree from
58055 Ossius now follows as the twelfth canon; the absence of this in the Greek text is explained by the fact that this proposal does not have the express approval of the synod and especially because this canon is of course of a very temporary nature, because here the procedure is prescribed for making the decisions of Sardica known; after publication the regulation automatically lapses. This council left behind several synodal letters. The most important is that to the bishops of the entire
58060 Church 97). Since Athanasius preserved this letter in Greek and Hilarius includes a Latin text in his collection of documents from Sardica, the conclusion seems justified that Sardica itself, as well as its canons, also made a double redaction of this general synodal letter; the number of Western bishops present in Sardica was approximately equal to the number of Eastern bishops. The address reads in Greek
58065 redaction: "The holy synod, by the grace of God assembled in Sardica, to the bishops and the Catholic Church everywhere in the world, beloved brethren, salvation in the Lord" 98). A second synodal letter is addressed to the Church that had suffered most from the Eusebian intrigues, the Church of Alexandria; the address of which is in the same terms as that of the previous letter 99). The bishops of Egypt and Libya
58070 received a similar letter); the Christians of Mareotis also honored the Fathers with a letter). At the request of the other bishops, who had been recognized as innocent by this council, the Fathers also sent letters to their Churches with the order to restore the previously expelled bishops to their dignity 102). Pope Julius was also allowed to receive a letter, of which only a Latin text exists; perhaps it was
58075 written by the council only in Latin 103). An official address is missing in the extant text. In all these official documents the course of the council is outlined and the decisions are communicated; in the letter to the Pope special attention is requested for the heretics Ursacius and Valens, who belong to the West. The Pope is requested to accept the judgment pronounced by the council with regard to these two
58080 "young men". Ursacius and Valens do not hesitate to spread their heresy in Italy; Valens himself had left his episcopal see to seize that of Aquileia, on which occasion riots had taken place; Bishop Viator, who had been unable to flee, had been so trampled underfoot that he died three days later. Finally, the Fathers addressed the Pope in writing to inform the bishops of Sicily, Sardinia, and Italy of
58085 everything. In this letter the Pope was addressed as "beatissime pater" and "eximia gravitas tua." According to this correspondence, the council also sent a petition to Emperor Constantius; in it the Fathers implored him to put an end to the intrigues and acts of violence of certain bishops and to forbid civil magistrates to interfere in ecclesiastical affairs.
58090 Athanasius personally sent a letter to the priests and deacons of Mareotis, which after a preambulum contains an almost complete copy of the synodal letter to the Church of Alexandria and finally signed by Athanasius as well as by a large number of bishops present in Sardica 105); Athanasius also wrote a letter to the priests and deacons of the Church of Alexandria 106).
58095 Pope Julius' joy over the results of Sardica was great. The Pope expressed this in a letter to the Church of Alexandria, which Athanasius included in his collection of documents 107). In this letter the Alexandrian Church is congratulated on the recovery of Athanasius, on its steadfastness in the faith, on the fact that Athanasius, despite his long absence, has not forgotten his episcopal church. After a
58100 eulogy of Athanasius 108), the Pope says that Athanasius is now returning more gloriously than he left. They must therefore receive their bishop with joy as a true Athanasius (immortal) 109); in the spirit of it the Pope sees all the demonstration of joy in honour of Athanasius' return. The joy also falls largely on the Pope, since he has come to know such an illustrious man. This letter is concluded with a prayer.
58105 Emperor Constantius had also already shown his good disposition towards Athanasius, but not before he had received a more or less threatening letter from his brother, Emperor Constans, with whom Athanasius and Paul of Constantinopel had sought refuge 110). In a threefold letter to Athanasius the emperor invited the bishop to come to an audience with him; to his brother, the emperor Constans, he had already sent a
58110 letter requesting Athanasius to grant him leave to return to Alexandria. 111) From Sardica a circular letter had also been sent by the Eusebians to all the bishops and other ecclesiastical ministers and faithful of the whole Church, but was addressed in

particular to Gregory of Alexandria, the schismatic bishop Donatus of Carthage, Maximus of Salonae, the present Spalato on the Adriatic, and to some other bishops. This letter was handed down in Latin translation by Hilarius 112). The address reads as follows: "To Bishop Gregory of Alexandria, to the Bishop of Nicomedia, the Bishop of Carthage, the Bishop of Campania, the Bishop of Neapolis in Campania, to the clergy of Rimini, to the Bishop of Campania, the Bishop of Salonae in Dalmatia, Amphion, Donatus, Desiderius, Fortunatus, Euthicius, Maximus, Sinferons, and to all our fellow bishops throughout the world, to the priests and deacons, and to all who are in the holy catholic Church here in the world, the bishops who assembled in the city of Sardica to hold a council from the different provinces of the East, namely, from the province of Thebais, and the province of Palestine, Arabia, Phoenicia, Syria, Mesopotamia, Cilicia, [Galatia], Isauria, Cappadocia, Galatia, Pontus, Bithynia, Pamphylia, Paphlagonia, Caria, Phrygia, Pisidia and the islands of the Cyclades, of Lydia, Asia, Europe, the Hellespont, Thrace, Emimontus, eternal salvation in the Lord." 113) The Eusebians begin with the following words: "We continually ask in our prayer, dearly beloved brethren, first of all that the holy catholic Church of the Lord, free from all discord and schism, may everywhere preserve the unity of spirit and the bond of charity in the orthodox faith. It is also fitting that all who call upon the Lord, and especially we, the bishops, who are at the head of the holy Churches, preserve, embrace and maintain an undefiled life. Secondly, we pray that the ecclesiastical ordinance and the sacred tradition of the Fathers and their decrees may remain in force and unshaken for ever, and that new sects or pernicious traditions, especially in the appointment or deposition of bishops, may never trouble us, but on the contrary the evangelical and sacred precepts and what was prescribed by the holy and most blessed Apostles and by our forefathers and has been observed and is observed by ourselves to this day, may remain in force 114). Then they discuss the question of Marcellus of Ancyra, "that accursed heretical plague", condemned at the Council of Constantinopel in 336, but received into communion with Sardica, even by Protogenes of Sardica, who had signed the decree of condemnation of Constantinopel. The Pope is also accused of having received Marcellus and acquitted him of heresy. The Eusebians forbid anyone to have intercourse with him or his followers 115). Then follows a long series of accusations against Athanasius 116), after which Paul of Constantinopel, Marcellus of Ancyra, Asclepas of Gaza, Lucius of Adrianople and again Athanasius are accused of the worst crimes, as well as of intrigues with the Western bishops, so that they even "planned to introduce a new law by having the Eastern bishops judged by the Western bishops" 117). Next the Eusebians give their partial and dishonest representation of the proceedings at Sardica 118). With the fine words: "A great multitude of all sorts of evildoers and rabble, coming from Constantinopel and Alexandria, gathered at Sardica," a defamation of the Fathers of Sardica is introduced. 119) After the Eusebians have declared that they must therefore withdraw from Sardica and that the schism is entirely due to the Western bishops, they forbid communication with Ossius, Protogenes, Athanasius, Marcellus, Asclepas, Paulus, and also Pope Julius; After this they even venture to urge to preserve unity and peace in the Church and to elect only holy bishops, that is, men pure in faith and with a holy life 120). After having again accused the Western bishops and appealed to the inviolability of synodal decisions, they announce that the entire council has condemned, according to ancient law, Pope Julius, Ossius, Protogenes, Gaudentius (of Nice) and Maximus of Trier, because of their communion with Athanasius, Marcellus, Paul of Constantinopel and their followers; in what that communion consists is further elaborated for each separately 121). The letter ends with a confession of faith, which is equal to the fourth formula of Antioch, except for a small addition; this confession is followed by some anathematisms 122). A long series of signatures, in all seventy-three, concludes this document 123). The Eusebians also addressed this letter especially to Donatus of Carthage, probably in order to win over the Donatists, as they had previously won over the Meletian party in Egypt. From various reports in St. Augustine it appears that the Eusebians succeeded in their intention to pass off their illegal meeting in the Church of Carthage as the true Council of Sardica, so that Augustine, unaware of the true facts, could write to the Donatists that the Council of Sardica was a council of Arians 124).

A survey of the terminology shows that Theodoret, in the few words which he himself devotes to this council, gives it no higher title than "synod". The same is the case with Sozomenus. When Socrates speaks about the convocation, he says twice that it concerns "ecumenical synod", otherwise it is at most "synod". In addition to the many texts in which Athanasius Sardica simply calls "synod", there are two texts in him in

which mention is made of the "great synod at Sardica 125) and thirteen texts in which the expression the "holy" synod occurs 126), of which once in direct connection with Nicea, which is there locally called "the synod at Nicea" 127). In the address of its synodal letters and in its promulgation bull of the canons, one sees the council itself repeatedly calling itself "the Holy Synod, "by the grace of God" gathered at Sardica; also in the letters themselves the council always speaks of "the holy" synod, or "the synod of all the holy bishops" 128), or "the holy and great synod" 129). The council explicitly says in its synodal letter to the entire Church that it "unanimously" deposed the intruder Gregory as bishop of Alexandria 130); thus Athanasius writes that "the entire holy synod" deposed the various bishops 131); in the same spirit Pope Julius writes that Athanasius has been declared innocent by the judgment of the entire synod 132). No mention is ever made of differing opinions among the Fathers, except with regard to whether or not to issue a formula of faith, and this question too has apparently been resolved to everyone's satisfaction. Here too one naturally finds the usual terminology of calling together 133), coming together 134), holding a synod 135), gathering 136) and determining, establishing, defining 137). In the canons one finds the terms beplezier 138), be of opinion 139), determine 140), befit 141). The verbs occur in the first person plural 142) or in the second person plural 143). The Fathers are addressed in the canons as; "if it pleases you, beloved brothers" 144), "Your sagacity must judge" 145), "Let your holiness establish" 146); in the twentieth canon it reads very solemnly: "That which is wholesome and fitting and in accordance with the honor of us priests, and according to the pleasure of God and man, will preserve the firm force; to this proposal all respond; "this opinion suits and pleases us" 147). The tenth canon points out that all scrupulousness and care must be used 148) and all respond that the decision is definitive and valid for all time 149). The bishops declare in the eleventh canon that they take this decision because it is already very appropriate 150) In the fifteenth canon the bishops respond that this too is definite 151). They were therefore convinced of the definitive force of their decisions. The indissolubility is also the view which the Eusebians tried to gain acceptance with regard to the decisions taken at their various synods against Athanasius and other accused; for by appealing to this they denied Sardica the right to judge these persons again. When one has to determine the value of this council, one will immediately feel compelled to say that the Council of Sardica has all the airs of a General Council. The decision to hold a general synod was made by various bishops in the East and West, among whom the Pope each. The emperors of both empires convened the council with the intention that it would be a synod of the East and West of the entire Church. And bishops from all directions came to Sardica even if one only takes into account the orthodox group one still sees the various parts of the Church represented with the exception of Britain 152). Papal participation in the deliberations was guaranteed by the presence of two priests and one deacon, a larger number of presence then at the Council of Nicea. The issues that Sardica had to resolve were fully worthy of a General Council; after all, it was not just about personal issues, but about "the restoration of the true faith" itself, a new attempt at unity and peace in Church and State, which had been hoped for in vain as a result of Nicea. Moreover, as at Nicea, the Easter question was on the agenda. Church discipline also had full interest, as is evident from the series of canons. The required papal ratification was also present, since the decisions were taken unanimously and thus also the papal representatives approved those decisions; their names therefore appear on the signature lists 153). However, nothing is known about papal ratification, consisting of a special act by Pope Julius after the end of the council, with respect to Sardica, just as little as with Nicea. From the letter which the council sent to Pope Julius, it appears that the Fathers did not consider such a ratification necessary; it was not their intention by means of this letter to request the Pope to ratify the decisions taken, but to officially inform the Pope of these decisions, which were valid and legally valid in themselves, and at the same time to request him to inform the neighbouring Churches with which persons they were to maintain communion according to the synodal decision and with which persons they were not 154). That the Pope was in complete agreement with Sardica may be concluded indirectly from the letter of Julius to the Church of Alexandria, in which he expresses his joy at the rehabilitation of Athanasius. The council also sent a circular to all the Churches to make the decisions known, and according to the testimonies of Athanasius, subscriptions flowed in from all sides; one gets the impression that the outcome of Sardica was a relief to all orthodox believers in the entire Church; they had all desired such a solution. The emperors were also informed by letter; the Western emperor Constans immediately expressed his joy; the more Eusebian-minded Eastern

emperor Constantius, also under pressure from his imperial brother, felt compelled to accept the decision of Sardica concerning Athanasius. All the usual requisites for a General Council are apparently present in Sardica. That the Fathers of Sardica themselves were convinced to put together a more than ordinary council, more than just a council of the Western Church, is already evident from the address of their letter to the Alexandrian Church: "The holy synod by the grace of God gathered together in Sardinia, from Rome, Spain, Gaul, Italy, Campania, Calabria, Apulia, Africa, Sardinia, Pannonia, Moesia, Dacia, Noricum, Siscia, Dardania, the other Dacia, Macedonia, Thessaly, Aachâia, Epirus, Thrace and Rhodope, Palestine, Arabia, Crete and Egypt, to the priests and deacons and to the whole holy Church of God in Alexandria, to the beloved brethren salvation in the Lord" 155). Many people's attention has naturally been drawn to the question of whether this council belongs to the ecumenical one, especially since this council in its third, fourth and fifth canons establishes a right of appeal to Rome and thus deals with and contains papal jurisdiction and the views on it in the fourth century 156). Since this council is indicated in the sources as a General Council by design, it is significant that no source calls it an "ecumenical" council; it may be called a "great" council, a "holy" one, or both together, every reporter and even the council itself are careful not to speak of "ecumenical". Sulpicius Severus relates that the emperor "convenes bishops from all over the world at Sardica" 157). And Socrates reports that the followers of Paul of Constantinopel and Athanasius wanted to see an end to the question by a "general synod" and that therefore a "general" synod is called 158). But in both cases apparently nothing more is said than that the design was that of a "general". Emperor Justinian mentions in his *Confessio rectae fidei* that various doctrines were proclaimed which were contrary to the symbolum of Nicea; these persons were condemned, either during their life or after their death, by Pope Damasus and by "the synod of Sardica". This is how it is in the Greek text according to the edition of Migne. In the council edition of Hardouin, however, it says "the ecumenical synod of Sardica", which can also be read in the Latin translation, both by Migne and Hardouin, where the words occur: "ab universali Sardicensi synodo". Perhaps all this came about under the influence of the environment, because in this writing there is talk several times of General Councils and especially because just before that the Council of Nicea is mentioned and immediately afterwards that of Chalcedon, both of which, however, in the Greek and Latin text, both in Migne and Hardouin, are simply called "the holy synod" 159). It is certainly not the intention of Emperor Justinian to regard Sardica as a General Council and to put it on the same level as Nicea, Constantinopel 381, Ephesus and Chalcedon, because elsewhere in this same writing he mentions these four councils in succession, apparently in order to enumerate the "general" ones that had taken place up to that time and were regarded as such 160), which is further confirmed by two other passages from two other writings of Justinian on the same subject 161). Moreover, if there are no other testimonies from which it would appear that Sardica was regarded as general, then an emperor is not the competent person to decide on the generality. The defenders of the generality of Sardica have also appealed to the second canon of the Trullan synod in 680-681, in which the Fathers ratified the canons of Sardica. It is true that the ratification of the Sardicean canons comes immediately after that of the canons of Constantinopel 381, of Ephesus and of Chalcedon, but in the same canon are also ratified those of Nicea, Ancyra, Neocaesarea, Gangra, Antioch in Syria, Laodicea in Phrygia; after that of Sardica follows the ratification of the canons of Carthage, Constantinopel, of Bishop Dionysius, Bishop Peter and a whole series of bishops 162). This Trullan canon cannot therefore be cited as a witness for the view of the generality of Sardica; then Ancyra, Neocaesarea and all the other synods mentioned would also have been conceived as general, which no one will accept or assert; moreover, the canons of individual bishops then a very strange phenomenon in the series. People have also appealed to a statement by Pope Nicholas I (858-867). He writes to Photius: "That you now say that you have or accept neither the council of Sardica nor the decretals of the holy Popes, we find it difficult to believe: especially since the council of Sardica, which was held in your territories, is also accepted by the entire Church; how could it then happen that the holy Church of Constantinopel would have rejected this council and would not have adhered to it properly?" 163) In this letter the Pope contests the view of Photius, who, by appealing to examples such as St. Ambrose, Nectarius and Tarasius, wanted to prove that he had rightly become a bishop from a layman. This is not in accordance with the law, but on the contrary contrary to ecclesiastical and papal regulations, according to the Pope. Also in conflict with the ordinances of Sardica. You say that the Constantinopolitan Church

does not know or accept them. How is that possible? The entire Church knows the legal validity of the provisions of Sardica and therefore accepts them as decisions with legal force. The Pope therefore appeals to nothing more or less than the general recognition of the legal validity of the canons or decisions of Sardica. But it does not follow from this that the Pope or his contemporaries accepted this council as "general". Also the councils such as Ancyra, Neocaesarea and so many others were and are generally accepted, in other words generally recognized as real councils with legally valid decisions, while there is no mention at all of the concept of "general" councils. At the time of St. Augustine, one certainly did not think of a recognition of ecumenicity. For then Augustine could not have been so ignorant of the true character of Sardica and could not simply have called this council a "synod of Arians".

Nowhere is there an ecclesiastical testimony to be found in favor of ecumenicity; on the contrary, when a list is given of general councils, Sardica is always missing. Despite its airs of generality, this council was never accepted by the Church as ecumenical 164). At first glance this may seem surprising, but on closer inspection it is understandable. The council was intended as a meeting of the joint episcopate from East and West, of followers of Nicea, of moderates and of opponents of the Nicene *ὁποῴαιος*; in order to bring both parts of the Church together again and to restore unity between all. The various parties therefore received a summons and arrived in Sardica; but immediately, from the very beginning, a large group, almost half the total number, separated under the leadership of Eusebius. In very general terms one may say that in Sardica from the very beginning the East, that is to say those who had at least a shudder for the *ὁποῴσιος*; and to whom persons like Athanasius and Marcellus were suspect, stood opposed to the West or those who had a predilection for the *ὁποῴσιος* and were convinced of the orthodoxy and innocence of Athanasius and Marcellus. As a result, Sardica was no longer a general council, but immediately a Western council, despite the fact that several Eastern bishops also fall under the title of "Westerners". According to the view of that time and in accordance with the actual situation, one had to consider the council of Sardica not as a general council, but only as a Western one, in which the only tendency was indeed the specifically Western tendency. From the beginning, Sardica also meant a failure, because due to the separation of one group, the goal: to restore unity between both areas, was and remained unattainable. No wonder, therefore, that contemporaries never saw an ecumenical synod in Sardica and that the very first sources already speak of the council of the Westerners and the separate meetings of the Easterners. Already at that time, that is, in the first half of the 4th century, people were convinced that the characteristics of a General Council included: the representation of the entire Church, of East and West, and that without this representation no council could be called "general". According to the testimony of Athanasius 165), the Council of Sardica was convinced that the creed of Nicea was sufficient and even perfect and therefore left nothing to be desired. New formulas of faith were therefore unnecessary and harmful to the perfect creed of Nicea.

CONCLUSION

At the end of this study it is possible and desirable to offer a summary of the separate conclusions, which are written down on the basis of the historical data at the end of each chapter. In connection with the Introduction to this work, some dogmatic reflections are added to the historical conclusions.

Before the year 400 there was no council that was so much in the center of attention among proponents and opponents as the Council of the three hundred and eighteen Fathers, assembled in Nicea in 325. The dogmatic controversies in the 4th century concentrated almost exclusively on the Nicene Council with its confession of faith. Initially, the heretical direction of the Eusebians did not dare to open an action against the Nicene confession. Their first effort was aimed at rendering the great proponents and defenders of Nicea harmless by discrediting them; the Eusebians deliberately refrained from accusations of a dogmatic nature. The year 341 brought a change in the tactics of the Eusebians. From this time onwards the question of faith itself came more to the fore. New creeds with all sorts of nuances followed each other in quick succession; it was intended that by their introduction they would deprive the Nicene Creed with the hated *ὁποῴσιος*; of its prestige; the Nicene Creed had to fade into the background or better yet disappear. This reaction against the Nicene Creed also meant a sideways reaction, however, because an open and direct rejection of the Nicene Creed would immediately have branded the Eusebians as heretics and would have excluded them from the Church by the fact itself. Their

tactics, however, even though they were sideways, were fully understood by the followers of Nicea and therefore fiercely opposed. During the 4th century, one sees everything that was orthodox rallying in explicit terms to Nicea, everything that was against the *óποουοιόκ*; making attempts in all sorts of ways to undermine Nicea. Nicea was considered the most exalted council, standing on the highest step of the hierarchical gradation, as the council that put all others in the shade, as the council "in the true sense of the word".

The reason for this special esteem is already expressed in the term that was used for this council: Nicea and Nicea alone is an *αόνο&οq oiKoupeviKr]*, a catholic or general synod, a world synod. Nicea is the only council that receives the full meaning of this terminology in the 4th century. Repeatedly between 325 and 400 the desire for a world synod arose, several serious attempts to bring about a world synod were made, the plans were carried out several times, but each time they failed and only Nicea was considered ecumenical. Even the Council of Sardica in 343-344, which apparently possessed all the requirements of a General Council, did not receive the term "ecumenical", nor did Rimini-Seleucia in 359. In order to qualify for the title of General Council, another requirement was that the council indeed be a world synod. The Council Fathers really had to represent the whole Church, East and West and all parts of the Church. But even the Christians of the fourth century did not make the impossible demand that numerically all the bishops of the whole Church were present; nor did they rack their brains with the question of how large the number had to be exactly or in percentage terms in order to be able to consider a council as general; it was sufficient if the composition of the bishops present was of such a nature that one could say: the assembled bishops represent the whole Church teaching authority, because they represent the whole Church and all parts of the Church. Because Nicea fulfilled these requirements, it was eligible for the dignity of General Council and received the name of world synod. The absence of this requirement at the Council of Arles in 314, in which the East had no part, is the reason why this council was not considered general, however important it was. The Council of Sardica 343-344 was divided from the beginning into two large parties, of which one party, the Eusebians, separated itself and met separately; as a result, this council was actually no more than a Western council and the goal: restoration of unity, became unattainable from the start. Constantinople 381 was a purely Eastern council and was intended and convened as such. Because the Eastern episcopate actually kept aloof, the Roman council of 382 was an explicitly Western council. And although the number of Westerners at the Council of Nicea, certainly in proportion to the number of Easterners, was very small, the Westerners present were the representatives of the entire Western Church and of all parts of the Western Church: North Africa, Calabria, Northern Italy, Rome, Gaul and Spain, as well as the more Eastern parts of the Western Church such as Moesia and Dacia. Despite their small number, the Western bishops evidently had a strong influence, given the insertion of the term *óποουαίόκ*; in the symbolum and the content of various canons; they therefore really gave evidence of their presence. Only from Britain no representative is known; this province was moreover often absent from the great councils of the fourth century, as example also on that of Sardica; the absence of one province, which moreover lay more on the periphery of the inhabited world and did not yet possess such great influence, was apparently no obstacle to the view that the entire Church teaching authority was represented at the Council of Nicea.

The character of universality through representation of the entire Catholic episcopate seemed, in our opinion rightly, to be considered saved, when the entire East and the entire West each met separately and after determining the position each sent an embassy, which both embassies, having come together in one place, had to act as the spokesmen of both episcopates in order to come to a definitive agreement after joint consultation. An intention, however, which failed for various reasons at Rimini-Seleucia.

There must be a sufficient or legitimate reason for holding a synod. Already from ancient times the seriousness and importance of the issues made bishops meet to consult together. A judgment of several bishops, after all, will be more mature and correct and therefore carry more weight. The more far-reaching the questions were, the more desirable it was to hold a more influential or larger synod. And the further, geographically speaking, an issue extended, the larger area naturally the synod had to cover, as far as the assembled bishops were concerned. In 381 and 382, did one not hear Ambrose and the Eastern episcopate assert that exclusively Western affairs should be resolved by a Western council and exclusively Eastern affairs by an Eastern council? The question, however, which was on the programme for the Council of Nicea, certainly justified a world meeting. The heresy of Arius was dangerous and

naturally vital enough to stir up the entire Church, as the facts have shown. Moreover, it undermined the very foundations of the Christian faith. True faith and peace and order in Church and State were at stake. At the same time, this meeting of bishops could serve as the glorious manifestation of the unity of the Holy Church, which, despite the persecutions, had formed itself into a world institution and now, since the reign of Constantine the Great, promised to enter into a flourishing future. The Fathers of the fourth century continually emphasized the unanimity with which decisions were made. However, unanimity should not be taken in an absolute sense. For example, two Egyptian bishops continued to refuse to sign the formula of Nicea; after the other Fathers had signed the formula, they excluded both Egyptians from the ecclesiastical community. From the fact that Pope Liberius wrote to the Easterners after the Roman synod of the year 353 that there was no reason to depart from Athanasius, since the majority of the bishops present at the council had declared Athanasius innocent, we may perhaps conclude that according to the view of the 4th century the majority was sufficient to make a legally valid decision. The 4th century did not consider it necessary that unanimity was present from the very beginning. At the Council of Nicea, agreement on the Easter question was only reached after exchange of ideas and even opposition, and the formulation of the creed was also preceded by lengthy deliberations, much conflict and careful investigation. However, if the final agreement is to have any value, it is necessary that it be reached freely and without coercion. This is also one of the reasons why Rimini-Seleucia 359 was never considered ecumenical; the final signatures were involuntary and forced, so that they did not reflect the inner view of the signatories. The agreement must therefore be the reflection of the inner mood, of the inner conception, as can be read from the synodal letter of the Roman synod of 368 to the Eastern bishops and to those of Illyria. The inner conception of the Fathers of Rimini-Seleucia was to be found in their initial refusal to sign; when they had finally freed themselves from pressure and coercion, they, one after the other, revoked their signature.

As for the question of the Pope's cooperation, this cannot be determined in a single word. In fact, the Pope's cooperation at the Council of Nicea consisted in his presence through two representatives, in the participation in the deliberations by these representatives, and in the ratification of the creed and the canons by their signature. In reality, therefore, the bishops present formed the entire ecclesiastical teaching authority, because Rome also participated with the other parts of the Church. By this presence of the papal legates the influence on and participation in the deliberations of the Roman Church was guaranteed, just as by the signing of the creed and canons the ratification of the Roman Church was confirmed. Whether the 4th century considered this cooperation, and in particular this ratification, as requirements, is not so clear. From the history of facts one can establish with certainty that the 4th century did not consider papal ratification by a separate act after the end of the council to be necessary in order to accept the legal validity of the decisions and to consider the council as general. If one then examines the many texts in which the Fathers and ecclesiastical writers speak about Nicea, it is immediately noticeable that no attention is paid to papal cooperation, nor to papal ratification, which is included in the votum of the papal legates and in their signing of the acts; even St. Athanasius, the ardent defender of Nicea, who possessed an almost fully developed theory about the General Council, did not mention this cooperation in his numerous writings. However, it is not justified to conclude from this that this cooperation was not required according to the then prevailing view. There are also too many testimonies from this century, from which a recognition of the Primacy of Rome is evident, for such a conclusion to remain unpunished. Only a positive statement by one or other or by more Fathers about the non-necessity of this cooperation would legitimize the conclusion. Such a statement is not now available.

Moreover, the evidence to the contrary, especially for the necessity of papal cooperation or, more correctly, ratification, is not entirely lacking in the fourth century. The lack of papal approval was the first complaint that the Roman synod of 368 clearly brought forward against Rimini in its synodal letters; no one should be misled by the large number of bishops assembled in Rimini, because the Pope had not given his approval, according to the synodal letter to the Illyrians. In other words: all the bishops in the world without the Pope are not able to form a General Council and cannot make generally binding and always valid decisions. The Roman synod in 368 was therefore apparently of the opinion that papal approval or ratification was necessary. If one projects this opinion a decade ago and applies it to the synod of Milan 355, to which all the bishops of the world were invited, in which many Western

and also some Eastern bishops participated as well as a papal embassy, one can put forward as another reason why this synod was never recognized as general, the fact that both papal embassies refused to sign and Pope Liberius even openly disapproved of the synod in the same year. On this basis one might conclude that the 4th century considered the necessity of papal cooperation, in particular papal ratification, as a requirement.

From the otherwise general silence, however, one can, we think, conclude that the 4th century was not deeply imbued with the necessity of such cooperation or at least gave its first and even exclusive attention to the representation by the entire Church. The specific term, introduced by the 4th century, for a Council like Nicea, namely the *ouoboc; oiKoupeVikg*, therefore has a pronounced geographical character.

Certainly, in the 4th century the Primacy of the Bishop of Rome was recognized. This did not, however, prevent the views on the Primacy and the practical implementation of those views from undergoing a whole development in the course of the centuries before they could catch, which is present today. Consider, for example, the view concerning the infallibility of the Pope. Not all rights and duties, not all consequences, which flow from the Primacy, could have been clearly and distinctly in the minds of the Fathers of the fourth century, if they were in their minds at all and did not previously remain in the subconscious. Thus, it seems to us, the question of the extent to which papal cooperation in a General Council was necessary, did not yet belong to the questions which the Fathers of the fourth century explicitly posed to themselves. And to that extent the doctrine concerning the General Council still had to undergo a development, just as the doctrine concerning the Primacy, taken in general, would still show a history of development. Precisely because the doctrine concerning papal cooperation in a General Council is a part of the doctrine concerning the Primacy, taken in general, the development of the one will keep pace with the development of the other and they will be able to influence each other mutually. To establish this development in its components, through the centuries, is of course beyond the scope of this work and will be the task of various historians. In any case, it is clear from this that one must be extremely careful about simply projecting modern dogmatic views back into the ancient past, in this case to want to see the modern views on the Pope's cooperation with the General Council come true in the 4th century. And one will certainly be embarking on dangerous paths, historically considered, if one wants to see the views that are currently valid regarding that papal cooperation, which are the fruit of a development that has lasted for centuries, explicitly present in the Fathers, that is to say the theologians, of Antiquity. That the 4th century was not yet fully aware of all the rights that flowed from the Primacy, and that those rights were more implicitly than explicitly included in the general idea of Primacy, which was and was explicitly present, is clearly illustrated by the questions of the convocation and the chairmanship. The convocation, including that of the General Council, was done by the emperor and by him alone, who regarded this as a matter which rightfully belonged to him as *basileus* and on which he could decide independently, without the cooperation, approval or order of a second, namely the Bishop of Rome, being required. The contemporaries, including the Council Fathers and the Popes, also granted the emperor the right to convene councils, in particular a General Council. It was also the emperor who dissolved the council and allowed the Fathers to return home. The Fathers of Rimini had waited in vain for this imperial permission for a long time, and this was also one of the means by which Emperor Constantius achieved his goal: the signing. The right to convene a General Council, however, is a right that naturally belongs only to the Pope as Head of the Church and that may be considered an inalienable right. Seen in this light, it is strange that in the fourth century the right of convocation was simply attributed to the emperor. Here a difficulty presents itself that cannot be solved by simply distinguishing between the right and whether or not it was used. For the case of the fourth century is not only such that the Pope did not use this right of convocation and left the convocation to the emperor, but it goes even further: the emperor was attributed the right of convocation and no thought or talk was given about the exclusive right of the Pope. In order to explain this fact, we think that an appeal can and must be made here too to the development in knowledge about the Primacy and the rights resulting from it²). It is also not surprising that in the fourth century no thought or talk was given about the Pope's right of convocation. In practice, only the empress was able to bring about a General Council, as far as the material side of it was concerned. The emperor came to the rescue, called the bishops together and made it possible for them to travel there and back and to stay there. The emperor could do it, the emperor did it. In such circumstances the opinion could easily take hold: the convocation is something that

the emperor must do, the convocation must come from the emperor, for the convocation we must go to the emperor. If the Fathers of the fourth century thought that the basileus had the right to convene, this, we think, means no more than that they thought that the convocation had to be done by the emperor. The question of law in the strict sense as well as the question whether the Pope as Head of the Church does not have the exclusive right to convene, are questions that were not yet asked at that time and did not yet occur to the Fathers of the fourth century. An answer to these questions should not really be sought in the fourth century. If the convocation was not done by the Pope, the presidency at the council was not in the hands of the Pope or the papal legates; in this century the Roman legates did not yet go to the councils to preside there. Here, therefore, an analogous picture presents itself as with the convocation. The question was not yet raised as to who in the strict sense of the word had the right to the presidency, and the Pope or the papal legates did not yet lay claim to the leadership; the leadership was simply left to the person who, because of his personal qualities or because of external circumstances, was the most suitable person for it.

That the Fathers precisely the representation of the entire Church and paid little, or better still, no attention to the papal cooperation in the Council, can be explained, apart from by appealing to the development of knowledge concerning the Primacy, also by the course of action which the heretics followed and against which the Fathers had to act. In order to undermine Nicea, the heretics convened one synod after another and in various ways they ensured that several of these synods were impressive in number. In contrast to this, the Fathers showed that these countersynods could not at all outweigh the Council of Nicea, since Nicea was a council at which the entire Church was represented, while the countersynods of the heretics, despite their outward impressiveness, were only particular synods. The whole is always more than a part or a few parts. The position which was taken by the heretics and against which the Fathers had to fight is also in another way a ground for explaining the fact that the Fathers paid no attention to the papal cooperation at the Council of Nicea. One of the principal arguments, after all, which the heretics tirelessly brought forward against the *ópooucnoç*; was the remark that this term did not appear in Holy Scripture. The heretics therefore referred the fight to the terrain of tradition. And against this the Fathers saw themselves obliged always to bring forward as an important argument in favor of the *ópoouoioc*; that this term was in agreement with the tradition which went back through the Fathers and the Apostles to Christ Himself and could be found in the prophetic, evangelical and apostolic books or in Holy Scripture. Therefore the *fides Nicaena* was identical with the *fides catholica* or *ecclesiastica* and this confession found the approval of the entire Church. This entire assent was then for the Fathers a new proof of the truth or infallibility of the Nicene faith. Thus in their argument tradition and especially Holy Scripture came first. The Nicene Creed or, more generally speaking, the dogmatic determinations of a General Council possessed, according to the Fathers of the fourth century, perpetual or infallible force. In their opposition to the heretical currents the Fathers came rather to exaggerate than to diminish the authority of the Nicene formula, since they repeatedly argued that this confession was not only sufficient, but also perfect and conclusive, so that besides the heresy of Arius, which it was about in the year 325, it also refuted all heresies. As to the cause of the authority: mention is made of the assistance of the Holy Ghost, for example by the Fathers of Rimini in their synodal letter to the emperor, sent before their apostasy; or the presence of Christ Himself at the Council is the guarantee of infallibility, as St. Ambrose teaches. Therefore, the opinion of the entire Catholic episcopate, assembled at the Council, is the opinion of God. In the first half of the 5th century, the historian Socrates will already say explicitly that the authority is not dependent on the greater or lesser learning of the Fathers. This view of the assistance of the Holy Spirit did not, however, exclude that one was convinced of the necessity of a careful and repeated investigation, of diligence and effort, in short of man's cooperation. Finally, if one has to answer the question whether the Pope was considered the subject of infallibility in the fourth century or the General Council itself, then the answer must be that the General Council itself was considered as such. The dogmatic decisions taken by the bishops assembled from the entire Church had, from the moment they were established at the council, a generally and always binding force. That the General Council itself was, according to the view of the fourth century, the subject of infallibility is evident from the fact that the approval or ratification of the Pope by a separate act after the end of the council was not considered necessary. The decisions had their definitive force through the fact itself that the council had established them with general consent. Also from the

synodal letter of Sardica to Pope Julius it appears that the Fathers did not consider it necessary to ratify the Pope by means of a separate act; by this letter they simply officially informed the Pope of their decisions, which were valid and legally valid in themselves. Secondly, it also applies here that in the 4th century people did not yet explicitly ask themselves whether the Pope possessed the gift of infallibility; and certainly not whether the General Council or actually the Pope and with and through him the Council possessed that gift. People were explicitly of the opinion that the subject of infallibility was in the Church: the General Council as such. The reflections on the relationship and the interaction between the Pope and the General Council are of a later date. If one wants to summarize everything in one formula, then one can say: for the Fathers of the 4th century, the Council of Nicaea was a meeting of bishops, who, summoned for a good, legitimate reason, represented the entire Church or the entire Church teaching authority and who, after deliberation, unanimously and in full freedom, reached their decisions and above all drew up their infallible confession of faith, through the assistance of the Holy Spirit or that of Christ. The doctrine contained in this confession was not the own invention of the Nicene Fathers, but a summary of that which was contained in the written source of Revelation, the Holy Scripture, and in the oral tradition, which was ultimately the doctrine of Christ Himself. The Nicene faith was therefore identical with the fides catholica, the faith that had the general assent of the Church.

Purpose of this study: a purely historical investigation of the facts and the views in the 4th century, which can shed light on the questions concerning the concept of "Ecumenical Council", XXVI-XXVII.

Chapter I. Synods before the year 325, Terminology and Nature 1-25 Reason for investigation into terminology and nature, 1. Sobriety in terminology, 1. In Eusebius of Caesarea and Polycrates of Ephesus with regard to the synods on the Easter Controversy in the 11th century, 1-2. In Cyprian on the Synods of Carthage in the IIIth Century, 2-3. In the Synodal Acts of Carthage 256, 3-4. Cyprian and Dionysius of Alexandria on the Councils of Baptism of Heresies, 4-5. In post-Nicene writers, 5-7. Synod at Antioch in 268, 7-8. Council of Elvira around 300, 8. Synods in the early 4th century, 8. Council at Arles in 314: participants, 8-10. Not ecumenical, 10-14. Canons of Ancyra (314) and the curiosity of the seventeenth canon, 14-16. Synod at Neo-Caesarea, 16. Synod at Alexandria circa 323, 16-18. Various synods, 18-19. Terminology, 19. Reasons for these meetings, 19-23. Agreement, 23. Authority of the particular synods, 23-25.

Chapter II. The First General Council at Nicaea in 325 26-52 Initiators, 26-29. Convocation by the emperor, 29-32. Number of participants, 32-33. Where from, 33-34. Nature and disposition of the participants, 35. Representation of the Pope, 35-36. The first meeting, 36-37. Presidency, 37-39. The Arian question, the *ónoóoioc*;, 39-41. The Nicene Creed and its signature, 41-42. Condemnation, 42. The question of the Meletian schism in Egypt, 42-43. The question of the date of Easter, 43. The twenty canons and their terminology, 43-44. The collections of canons and their terminology, 44-45. Closing ceremonies of the Council, 45-46. The synodal letter and its terminology, 46. Were there any official Acts? 46. Emperor Constantine in his letters on the Council, 46-48. Summary, 48-50. Papal ratification, 50-51. Imperial ratification, 52.

Chapter III. The Eusebian reaction against Nicaea. 53-86 Introduction, 53. Eusebius of Nicomedia, Maris of Chalcedon and Theognis of

- Nicaea against Nicaea; Athanasius bishop of Alexandria, 53. Eusebius' influence at the imperial court, 54. Eusebius against Eustathius of Antioch, 54-55. Eusebius against Athanasius, 55. Synod of Tyre in 335: participants, charges against
- 58710 Athanasius, Eusebian committee to Mareotis, protest of Egyptians, deposition of Athanasius, 55-60. Synod of Jerusalem in 335: eulogy of Eusebius of Caesarea, true nature of this synod, admission of the Arians, 60-63. Events at Constantinople, banishment of Athanasius, 63-64. Synod at Constantinople in 336: deposition and
- 58715 banishment of Marcellus of Ancyra, 64. Athanasius returns to Alexandria, 64-65. New intrigues against Athanasius, 65. Catholic synod at Alexandria in 338, synodal letter, 65-68. Appearance of Pope Julius I, 68. Eusebian synod at Antioch in 339 elevates Gregory of Cappadocia to the Alexandrian see, 68-69. The Eusebians refuse to appear in Rome, 69-70. Synod at Rome at the end of 340: Athanasius and Marcellus
- 58720 acquitted, 70-71. Letter of Pope Julius to the Eusebians, 71-74. Importance of this letter for the Council of Nicaea, 74. Synod of Antioch in Encaeniis in 341: participants, 74-75. Its canons, 76-78. Its first confession of faith, 79-80. Its second and proper confession of faith, 80. The third confession of faith, 80-81. A fourth confession of faith, 81. Appreciation of posterity, 81-82. Synod at Gangra, 82-83. Summary, 83-85. Terminology, 85-86.
- 58725
- Chapter IV. The Council of Sardica in 343-344 87-115
Initiators of a General Council, convocation by the emperors, 87-88. Beginning and end point of the council, 88. Purpose of the council, 88-89. Participants from East and West, 89. Number of Eusebians and Orthodox, 89-91. The ecclesiastical provinces
- 58730 present, 91. Presidency, 92. Principal persons, 92-93. Conduct of the Eusebians, 93-94. Eusebian representation of the course of events, 94-95. Conduct of the Orthodox towards the Eusebians, 95-96. Acquittal of Athanasius, 96. Acquittal of Marcellus of Ancyra, 97. Acquittal of Asclepas of Gaza, 97. Synodal letter, 97-98. Question of faith and confession of faith, 98-100. Easter question, 100. Canons in Greek and
- 58735 Latin version, 100-103. Various synodal letters, 103-104. Letters of Athanasius, 105. Joy of Pope Julius, 105. Attitude of the emperors Constans and Constantius, 105. Circular letter of the Eusebians, 105-108. Survey of the terminology, 108-110. Value of this council: question whether it was an ecumenical synod, 110-115. Position of Sardica towards the Nicene Creed, 115.
- 58740
- Chapter V. -The period of the creeds 116-133
Introduction, 116. The *ποικρομχο*; of the synod at Antioch in 344, 116-117. Eusebian embassy at the council of Milan in 345, 117. Return of Athanasius to Alexandria, 117. Council at Milan in 347, 118. The question of Photinus of Sirmium, the Eusebian synod
- 58745 at Sirmium at the end of 347, 118-119. The first formula of Sirmium, issued by the synod of 351-352, 119. The increasing strength of the Eusebians, 120. The synod at Rome in 353, under Pope Liberius, 120. The Council of Arles, end of 353-beginning of 354: the orthodox sign the condemnation of Athanasius, 120-121. The reaction of Pope Liberius, 121-122. The Council of Milan in 355: the orthodox again sign the
- 58750 condemnation of Athanasius, 122-123. Some steadfast ones, 123-124. The Eusebians encounter opposition in Gaul; exile of Hilary and Bishop Rhodanius of Toulouse, 124. Persecution in Egypt, terror in Rome, banishment of Pope Liberius and of Ossius of Cordova, 124-125. Schisms within the heresy, 125-126. The second formula of Sirmium, issued by the synod of 357, 126-127. Signature by Ossius of Cordova, 127.
- 58755 Enthusiastic reception of the formula at Antioch, 127-128. Opposition in the West, 128. Attitude of the East towards this formula, synod at Ancyra in Galatia in 358 and its formula, 128-129. Commentary of Basil and George on the synodal letter of Ancyra, 129-130. Constantius joins the Homoiousians, 130. The synod at Sirmium in 358 issues the third Sirmian formula, which is signed by Pope Liberius, 130-131. Liberius
- 58760 returns to Rome, 131. Summary and terminology, 131-133.
- Chapter VI. The failed attempts at unification of Rimini-Seleucia 359 134-158
Plan of a General Council by Basil of Ancyra, 134-135. A separate council for the East and for the West through the efforts of the Anhomeans, 135. The Anhomeans and the fourth formula of Sirmium or the dated Credo, 135-137. The procedure of the
- 58765 synods, 137. The council at Rimini: those present, 137-438. Steadfast attitude of the Orthodox towards the fourth formula and the heretics, 138-139. Orthodox delegation to the emperor, 139-140. Delegation of the heretics to the emperor, 140. Action of the emperor, 140. Defection of the Orthodox legation at Nike by signing the formula of Nike, 140-141. Defection of the Orthodox at Rimini, 141-142. A small group of
- 58770 faithful bishops finally surrenders; deception of Valens, 142-143. The council at Seleucia; attendees, 143-145. First session: question of faith, 145-146. Second

session: question of faith, 146-147. Third session: question of faith, 147-148. Fourth session: question of faith, 148-149. Fifth session: questions of personality, condemnation of Acacias, 149-150. Delegation to the emperor, 150. Theological dispute at Constantinople, 150-152. Various embassies assembled at Constantinople, signing of the formula, 152-153. Summary: on the nature of generality, 153-154. Testimonies in favor of Nicea, 154-156. The argument from tradition, 156. Terminology, 156-157. Necessity of unanimity, 157-158.

Chapter VII. Weakening of Arianism and rise of Pneumatomachism 159-181

Acacia synod at Constantinople in 360: question of faith, questions of persons, 159-160. Action against the homoiousians and the orthodox, 161. Judgment of Gregory of Nazianzus and of Basil the Great on the synods of Seleucia and Constantinople, 161-162. Orthodox synod at Paris in 360, 162-163. Synod at Antioch in 361, at which Meletius is elected bishop of Antioch, 163. Orthodox synod at Alexandria in 362, 163-165. The synodal letter or Tomus ad Antiochenos, 165-166. Schism of the Luciferians, 166. Pneumatomachism, 166-167. Synodal letter of the orthodox synod at Alexandria in 363, 167-168. Synod at Antioch in 363 and its synodal letter, 168-169. The homoiousians, 169. In the West the orthodox emperor Valentinian I, in Ostend the Arian emperor Valens, 169. Macedonian synod at Lampsacus in 364, 169. Synod at Nicomedia in 366, 169-170. The Macedonians call for help from the West: embassy to Pope Liberius, 170-171. Letter of Pope Liberius on behalf of the Western Church to the Eastern Church, 171. Synod in Sicily, 171. The embassy presents the Western letters at a council of the Macedonians at Tyana in 367, 171-172. Macedonian synod at Antioch in Caria, 172. Pope Damasus, 172. Synod at Rome on 1 October 368: the synodal letter Confidimus, 172-173. De explanatione fidei, 173-174. Synod at Rome in 375: the fragmentum Ea gratia, 174. Synod at Sirmium in 375 and the fragments Non nobis and Illud sane, 174-175. Synod at Iconium around the year 376, 175-176. Synod at Rome in 378, 176. Macedonian Synod at Antioch in Caria in 378, 176. Meletius resumes contact with the West at the Synod at Antioch in 379, 176. Reply Quod vestra caritas by Pope Damasus, 176-177. Summary, 177-179. Importance of the number of participants in a council and of their consent, 179. Terminology, 180-181. Unanimity, 181.

Chapter VIII. The doctrine on the General Council in the 4th century 182-217

Introduction, 182. St. Athanasius: terminology, 182-183. Athanasius' theory on the Ecumenical Council: quotation from his Epistola ad Afros episcopos, 183-184. Various conditions laid down by Athanasius: good reason, 185. Representation of the whole Church, 185. Mutual agreement, which must be free and without compulsion, 185. Doctrine not one's own invention, 185. Agreement with the doctrine of the Fathers, of the Apostles, of Christ Himself, 185-187. Agreement with the doctrine of Holy Scripture, 187. Doctrine must be the fides ecclesiastica or the doctrine of the catholica ecclesia, 187. Nicea is sufficient, 187-188. Athanasius' conduct not in conflict with this view, 188. Nicene doctrine is sufficient, not open to discussion or further investigation; Nicea is exalted above all synods, 188-189. Nicea possesses infallible authority, 189. Therefore possesses the consent of the whole world, 190. Terminology of Eusebius of Caesarea and Emperor Constantine on Nicea, 190-193. Eusebius' theory on the General Council, 193-194. Emperor Constantine on the authority of Nicea, 194. The ecumenicity of Nicaea, 194-195. The general consent and a careful investigation, 195. Nicene doctrine is tradition-doctrine, in particular the doctrine of Holy Scripture, and therefore represents the faith of the Church or the Catholic faith; a healthy development is possible and present, 195-199. The Nicene Creed is sufficient and adequate, 199-201. The Nicene Creed is infallible, 201-203. Nicaea is exalted above all synods, 204. The cause of infallibility is the assistance of the Holy Spirit or divine influence, 204-205. Very expressive expressions about Nicaea in the Fathers, 205-206. The Nicene faith has been agreed upon by the whole world, 206-207. Three hundred and eighteen as the number of the participants in Nicaea and the symbolism of this number: in Hilary, 207. In Pope Liberius, 207-208. In Athanasius, 208. In Gregory of Nazianzus, 208. In St. Ambrose, who brings the symbolism to full development and therein clearly teaches the infallibility of the Nicene Creed, 208-211. The Alexandrian Church and Nicaea, 211. Cappadocia and Nicaea, 211-212. The Antiochenes and Syrians about Nicaea, 212. Gaul and Nicaea, 213. Spain and Nicaea, 213. The Illyrians and Nicaea, 213-214. West Africa and Nicaea, 214. Sardinia and Nicaea, 214-215. Upper Italy and Nicaea, 215. The Church of Rome and Nicaea, 215-216. Summary, in which the cooperation of the Pope is discussed, 216-217.

Chapter IX. The Council of Constantinople in 381. 218-241

Introduction, 218. Convocation of the council by Emperor Theodosius, 218-219. Participants: the West or the Pope was not present, 219-220. Orthodox and Macedonian participants, 220-221. The three presidents, 221. The part of Emperor Theodosius, 221-222. Attitude of the Macedonians, 222. Election of Gregory of Nazianzus as bishop for the see of Constantinople, 222-223. Death of Meletius of Antioch, 223. Election of Flavian as Bishop of Antioch, 223. Departure of Gregory of Nazianzus, 223-224. Election of Nectarius as Bishop of Constantinople; he also succeeds Gregory as president, 224-227. On the Tomos of Constantinople, 227. The Creed, 227-229. The four canons of Constantinople: the first canon, 229-230. The second canon, 230-231. The third canon, 231-232. The fourth canon, 232. End of the council; the Theodosian law of July 30, 232-233. Synodal letter to Emperor Theodosius, 233. On the meaning of the imperial ratification, 233-234. On the fact that only a letter was written to the emperor, 234-235. The imperial approval, 235. On the so-called approval of the West and of Pope Damasus, 235-236. Terminology, 236-238. Unanimity, 238-239. Valid, legally binding decisions, 239. Summary, 239-240. How this council can be called a General Council, although it was not an Ecumenical Council in itself, 240-241. Nicaea 325 and Constantinople 381. 241.

Chapter X. The Council of Constantinople 381 and its immediate environment 242-279 Introduction, 242. Pope Damasus' position towards the schemer Maximus Cynicus, and towards Constantinople 381, 242-243. Maximus' actions, 243. Council of Aquileia in 381: various data, 243-244. Participants and chairman, 244-245. The official session of 3 September, at which the condemned division took place between Palladius of Ratlaria and Secundianus of Singidunum, 245-247. The first synodal letter, 247. The second synodal letter, 247. The third synodal letter, 247-248. The fourth synodal letter, which treats of Eastern questions, 248-249. Correspondence between Ambrose and Emperor Theodosius on Eastern affairs: nature of the Ambrose letters, 249-250. Letter from the emperor, 250. Letter Fidei of Ambrose, 250-251. Letter Sanctus of Ambrose, 251-253. Some remarks on these letters, 253-254. The Dissertations Maximini contra Ambrosium: contents, 254-256. What this writing reveals about the relationship between Pope Damasus and the Council of Aquileia, 256-258. The humiliating judgment of Palladius on Pope Damasus, 258. Palladius on the General Council, 258-259. Conclusion of the Dissertatio, 259. The Council of Constantinople 382: Gregory of Nazianzus's negative attitude, 259. The synodal letter to the bishops assembled in Rome, 260-264. Two canons of this council, 264-265. The Council of Rome 382 and its ecumenicity, 265-267. A religious conversation in Constantinople in 383, 267-269. This history of the synods gives no proof of an official approval by the Pope or by the West of the council of Constantinople in 381, 269-270. Nor do the works and correspondence of Pope Damasus, 270-271. Nor do the writings of the Fathers who took part in the synods of Aquileia or Rome, such as the writings of Ambrose, 271-272. Of Philastrius of Brescia, 272. Of Epiphanius of Salamis, Paulinus of Antioch and Jerome, 272-273. The opinion of the Fathers of Constantinople 381 themselves about their council: Gregory of Nazianzus, 273-275. Nectarius of Constantinople, Timothy of Alexandria, Cyril of Jerusalem and Gelasius of Caesarea, 275-276. Gregory of Nyssa, 276-277. Peter of Sebaste and Amphilochius of Iconium, 277-278. Diodorus of Tarsus and Eunomius of Cyzicus, 278. Conclusion: the Council of Constantinople 381 had little importance at the end of the fourth century, both in the East and in the West, 278-279.

Conclusion 280-288 Introduction, 280. Nicaea in the fourth century the center of attention among orthodox and heretics, 280. Nicaea the most sublime council, 280. The reason for this was the fact that Nicaea was a world synod, 280-281. For a General Council the representation of the entire Church's teaching authority is required, 281. How this requirement was fulfilled at Nicaea, 281-282. A special procedure which can preserve the character of universality, 282. On the legitimate reasons for holding councils in general and a General Council in particular, 282. Unanimity must not be understood in an absolute sense, 282-283. Nor does it have to be present from the first moment, 283. Must be free and without compulsion, 283. On the cooperation of the Pope: in the first place, in particular on ratification, in which reference is made to the development in views concerning Primacy, 283-285. On the convocation, 285-286. On the Presidency, 286. The scant attention paid in the fourth century to papal cooperation can also be explained by the conduct of the heretics, 286-287. According to the Fathers of the fourth century, the dogmatic decisions of a General Council possess infallible force, 287. The cause of this infallible authority is the assistance of the Holy Spirit or of Christ, 287-288. The subject of infallibility is the General Council as such according to the fourth

58905 century, 288. Short summary formula, 288.

Berichten over de ontdekte Germaanse begraafplaats in Deurne24 februari 2014 **Eind januari 1837 wordt op de heide bij Deurne**

een compleet grafveld gevonden. Al direct worden urnen als geschenk weggegeven, zodat er weinig duidelijkheid is over de voorwerpen en de huidige "verblijfplaats". In mindere mate geldt dit overigens ook voor de enkele andere voorwerpen die in de venen/moerassen in de gemeente Deurne zijn gevonden en elders in de Peel, en landelijk gezien in de veengebieden in het noorden van het land.

58925 In dit bestand beperk ik me tot de begraafplaats. Informatie over de andere gebieden is te vinden in andere bestanden van www.theelen.info.

Op mijn verzoek heeft de heer H. Pauts van het Rijksmuseum van Oudheden in Leiden nadere informatie gegeven over voorwerpen die zich al van oudsher in zijn museum bevinden. Toch zijn er enkele, tenminste de mortieren en stampers, afgestaan voor een op te richten museum. Vanaf dat moment zijn we het spoor bijster...

58930 De opmerkingen van H. Pauts zijn verwerkt tussen mijn eigen naspeuringen.

Verzamelde details betreffende de begraafplaats bij Deurne

[1] Verscheidene urnen of potten van verschillende grootte, allen met asch van verbrande lichamen en kleine beentjes opgevuld

58935 [2] terwijl in sommige stukjes van metaal en gedeelten van wapenen gevonden zijn

[3] Kempensche heide

[4] eerst 5, daarna 50 urnen gevonden

[5] Niet één penning of muntstuk is opgedolven; alleen een stukje metaal, hetwelk men meent voor een mondstuk van een blaasinstrument te moeten houden.

58940 [6] De opgravingen worden op sommige plekken nog voortgezet, doch men vindt in de urnen, zoo als gezegd is, niets dan asch en de bovengemelde menschenbeenderen.

[7] urnen of potten van verschillende grootte, allen met asch van verbrande lichamen en kleine beentjes opgevuld;

58945 [8] werden ons een aantal urnen toegezonden, die kort te voren te Deurne, in Noord-Brabant, ontdekt waren geworden; en werd het aantal nog vermeerderd door de opbrengst eener opzettelijke daartoe verordende opdelving, door den burgemeester dier plaats, de heer van Riet, aan het Museum  geschenke gegeven.

[9] Romeinsche voorwerpen uit de nalatenschap van wijlen den heer S. H. VAN DER NOORDAA werden ook eenige overgenomen, van de vroegere bewoners van ons Vaderland afkomstig:

58950 [10] De urnen blijken niet uit de Romeinse tijd te dateren, maar van vele honderden jaren daarvoor.

[11] Van den heer S. H. van der Noordaa, te Dordrecht, twee tufsteen en vijzels met stampers, in den omtrek van Deurne in Noord-Brabant opgedolven;

58955 [12] Deze objecten (vijzels) zijn NIET gevonden in de gegevens van de ruim 40.000 objecten online. De vijzels dateren zeer waarschijnlijk uit de middeleeuwen en zijn rond 1875 door het museum in Leiden  afgestaan aan een ander op te richten museum.

[13] Van den heer P. O. P. Guyot  te Nijmegen, eene allerbelangrijkste verzameling van bronzen en andere voorwerpen bij Deurne, in de provincie Noord-Brabant, opgedolven, en die voor het grootste gedeelte door den Ritmeester Baron van Voorst bijeengebragt, en aan den heer Guyot afgestaan waren.

58960 [14] is het Museum thans in het bezit gesteld van de voornaamste en zeldzaamste stukken, die bij de ontdekking te Deurne gedaan, voor den dag zijn gekomen, en die, langs verschillende wegen, eindelijk wederom bij elkander gebragt, een geheel vormen, dat [...]

58965 [15] Van den heer P. C. G. GUYOT, te Nijmegen, nog een aantal van tien urnen, potjes en schalen, te Deurne in Noord-Brabant gevonden;

[16] Van den Heer S. H. van der Noordaa te Dordrecht, nog een drietal kleine voorwerpen in urnen te Deurne gevonden.

58970 [17] Van de heer S. H. VAN DER NOORDAA ontvingen wij wederom een mortier van

tufsteen, in den omtrek van Deurne gevonden.

[18] No. 1-3 afkomstig van Deurne.

58975 [19] Romeinsche voorwerpen uit de nalatenschap van wijlen den heer S. H. VAN DER NOORDAA werden ook eenige overgenomen, van de vroegere bewoners van ons Vaderland afkomstig:

[20] eene zeer fraai gepolijste vuursteen BIJL, 12 dm. lang;

[21] een ruw bewerkte BAL van trachiet, 4 dm. in doorsnede;

[22] eene URNE van gebakken aarde, gevuld met verbrande menschenbeenderen, hoog 19 dm.;

58980 [23] eene andere URNE, 18 dm. hoog, met de daarin gevonden brokken van eene bronzen HAARNAALD;

[24, 25, 26] nog een drietal URNEN met verbrande beenderen en

[27] overblijfsels van bronzen RINGEN enz.; de urnen van 10, 15.5 en 16 duim hoogte;

[28] twee KOMMETJES, 9 en 7 dm.;

58985 [29] 4 POTJES van verschillende vormen, 6 5 tot 9.5 dm. hoog;

[30] een bekervormig VAATJE, 5.5 dm. hoog, en eenige brokstukken van potten.

[31] Al deze voorwerpen, met uitzondering welligt van de WIGGE, waren in 1837 op de oude begraafplaats te Deurne in Noordbrabant opgegraven;

58990 [32] een paar trachietsteen MORTIEREN met STAMPERS uit den omtrek van Deurne afkomstig en tot de reeds meermalen genoemde nalatenschap van wijlen den heer S. H. VAN DER NOORDAA behorende;

[33] zij vormen nu met de stukken die, ter zelfder plaats gevonden, in 1840 en 1841 door wijlen den heer P. O. G. GUYOT aan het Museum geschonken werden, een aanzienlijk geheel.

58995 [34] Een persoon met de naam van der Noordaa, wonende in Dinther, was rond 1820 schoolopzichter in een district van de provincie.

24 februari 2014 Antwoord van Heikki Pauts van het Rijksmuseum te Leiden

59000 Ik stuur u hieronder een complete lijst van vondsten uit Deurne, die het RMO in de 19de eeuw heeft gekregen. Een aantal van deze objecten kunt u ook op onze website vinden - daar zijn alleen de objecten gepubliceerd die een foto hebben. De rest van de informatie is afkomstig uit onze Inventarisboeken. Tussen 1818 en 1891 gebruikte men in het RMO voor de inventarisnummers een enigszins verwarrende combinatie van de voorletters van namen van personen en vindplaatsen, dus bijvoorbeeld "vRD" bevat "van Riet Deurne". Vanaf 1891 stapte het RMO over naar een nieuw systeem van inventarisnummers, bestaande uit provinciecode (k = Noord-Brabant), jaartal, / maand en volgnummer. Dus bijvoorbeeld k 1932/12.9 is in het museum binnengekomen in december 1932.

59010 4 februari 1837 **Deurne 3 Februarij 1837.**

Aan de Redactie van den Noord-Brabander. Sedert acht dagen levert de gemeente van Deurne een bewijs op, dat ook dit gewest schatten in zich bevat, wat oudheid en geschiedenis betreft, gerust met de andere deelen onzes lands gelijk kan gesteld worden. De aandacht onzer Vaderl. geleerden wordt derhalve op het volgende gevestigd: 59015 waardoor zij mogelijk in de gelegenheid gesteld zullen worden, niet alleen om hunne collectien van antiquiteiten met belangrijke artikelen te vermeerderen, maar ook om de geschiedenis met gewigtige bijdragen, dienst te bewijzen.

Door het corps offic. van het Regt. Huss. N°. 6 begonnen en door particulieren, in hoop van schatten te vinden, voortgezet, is men hier bezig, met het opdooven eener 59020 kamp of leger, of wel begraafplaats; denkelijk afkomstig, van eene door de Romeinen, uit de Ardennen verdreven, en hier, achter de moerasgronden der Peel, versholene volksstam. Verscheidene urnen of potten van verschillende grootte, allen met asch van verbrande ligchamen en kleine beentjes opgevuld, zijn reeds opgegraven; terwijl in sommige stukjes van metaal en gedeelten van wapenen gevonden zijn. Deze potten zijn 59025 door heuveltjes van differente hoogte bedekt, en die even als de potten, zekerlijk na het aanzien en rang, dat de aldaar begravenen bekleed heeft, in grootte en hoogte hebben toegenomen. De pot is bijna gelijk eene kloot, eenigzins naar het boven- en benedeneinde ovaal toeloopende, terwijl ze aan het bovineinde eene schuins opslaande rand heeft, die genoegzaam dezelfde omtrek als de pot zelve zal hebben, en het deksel

59030 dat in evenredigheid der pot zeer klein is, sluit goed en schijnt digt bestreken te zijn. De grootste potten zullen eene diameter van 3 palmen hebben terwijl de kleinste naauwelijks 1 a 1½ zullen reiken en de heuveltjes ook wel een verschil van bijna ééne el zullen opleveren, daar men er vindt, die schier 2 en anderen die meer dan vijf voeten hoog zijn. De potten zijn van potaarde (welke ook hier gevonden wordt) 59035 gemaakt, en toonen aan dat zij de kunst van draaijen reeds tot eene aanmerkelijke hoogte gebracht hadden.

P.

[elders nog:] - De aandacht onzer vaderlandsche geleerden en oudheidkundigen wordt op deze ontdekking, die tot aanwinst voor hunne verzamelingen, of tot opheldring der geschiedenis, van nut kan zijn, ingeroepen.

4 februari 1837 [1] Verscheidene urnen of potten van verschillende grootte, allen met asch van verbrande ligchamen en kleine beentjes opgevuld
[2] terwijl in sommige stukjes van metaal en gedeelten van wapenen gevonden zijn

4 mei 1837 **NEDERLANDEN. - In het laatst uitgekomen nummer**

van het *Nederlandsch Magazijn* treft men een artikel aan over de onlangs opgedolven urnen in Noord-Brabant. Hetzelve houdt hoofdzakelijk in dat men onlangs in onderscheidene onzer dagbladen, berigten vond wegens het opdelven van oudheden in de gemeente Deurne, provincie Noord-Brabant, en thans bij de Redactie van boven gemeld magazijn eenige bijzonderheden nopens die opdelving zijn ingekomen, voornamelijk hierop nederkomende: Een Ritmeester bij het regiment huzaren n°. 6, bij eene vroegere gelegenheid, ontwaar geworden zijnde, dat eenige heuveltjes op de Kempensche heide, bij opdelving, bleken grafheuveltjes te zijn, en urnen of aschkruiken te bevatten, kwam op het denkbeeld, dat eenige dergelijke heuveltjes, welke op de heide nabij Deurne, zijn tegenwoordig kantonnement, aanwezig waren, tot dergelijke einden mogten gediend hebben en oudheden bevatten. Met toestemming des burgemeesters aldaar, hebbende doen graven, vond men vijf urnen of asch-kruiken, welke bij opvolgende delvingen vermeerderden, en thans reeds het getal van vijftig te boven gaan. Jammer is het, dat de landlieden, hiervan gehoord hebbende, ook van hunne zijde aan het graven gingen, in de hoop om schatten te vinden; de door hen opgedolvene urnen in stukken sloegen of beschadigden; groot was de teleurstelling dezer lieden, toen zij in dezelve niets dan asch en eenige half vergane kennelijke menschen-beenderen, als: schedels, ribben, dijbeenderen enz. vonden. Niet één penning of muntstuk is opgedolven; alleen een stukje metaal, hetwelk men meent voor een mondstuk van een blaasinstrument te moeten houden. De gevonden urnen zijn van verschillende grootte, doch alle van nagenoeg ééne gedaante, sommige van deksels voorzien. Het heide-veld, waarin de urnen gevonden zijn, is omtrent vier bunders groot, de heuveltjes zijn vrij regelmatig, doch het geheel terrein schijnt tot begraafplaats gediend te hebben, dewijl men ook urnen buiten de heuveltjes en op eenigen afstand van dezelve heeft gevonden. De urnen zijn meestal met eene laag houtskool bedekt; immers zoodra men deze vindt, is men zeker nabij eene urn te zijn. Sommige zitten zoo hoog, dat men boven in de asch de vezelworteltjes der gewone heide vindt; andere zijn dieper gevonden, doch op ongelijke diepte. De zelfstandigheid, waaruit deze potten of urnen zijn zamengesteld, is glad, gedegen, en van eene donker bruine kleur; geen verglaassel is op dezelve zichtbaar, noch eenig in- of opschrift. Indien dezelve te Deurne vervaardigd zijn, alwaar thans nog twee pottebakkerijen gevonden worden, dan moet men bekennen, dat deze kunst aldaar in 10 of 15 eeuwen geene vorderingen gemaakt heeft; want deze urnen zijn zuiverder en gladder bewerkt en met meer zorg behandeld dan thans geschiedt. De opgravingen worden op sommige plekken nog voortgezet, doch men vindt in de urnen, zoo als gezegd is, niets dan asch en de bovengemelde menschenbeenderen.

24 februari 2014 Antwoord van Heikki Pauts van het Rijksmuseum te Leiden
- mei 1837, inventarisnummers NBD 1-3 "Opgegraven te Deurne en door het Ministerie van Binnenlandse Zaken aan het Museum ten geschenke gegeven";

4 mei 1837 [3] Kempensche heide
[4] eerst 5, daarna 50 urnen gevonden
[5] Niet één penning of muntstuk is opgedolven; alleen een stukje metaal, hetwelk men meent voor een mondstuk van een blaasinstrument te moeten houden.
[6] De opgravingen worden op sommige plekken nog voortgezet, doch men vindt in de urnen, zoo als gezegd is, niets dan asch en de bovengemelde menschenbeenderen.

3 juni 1837 **HAARLEM, 30 Februarij**

Uit de gemeente Deurne (Noord-Brabant) wordt een bericht medegedeeld wegens het ontdekken, in de nabijheid dier plaats, van een kampleger of wel begraafplaats; zoo men denkt afkomstig van een ouden volksstam, die door de Romeinen uit de Ardennes verdreven, willigt daar ter plaatse, achter de moerasgronden der Peel, eene veilige wijkplaats zochten. De eerste ontdekking dier leger- of begraafplaats werd gedaan

- door officieren van het in den omtrek gekantonneede regiment huzaren no. 6, en sedert worden de opdelvingen door particulieren, in hoop van schatten te vinden, voortgezet.
- 59105 Onder hetgeen tot dus ver gevonden is noemt men verscheidene urnen of potten van verschillende grootte, allen met asch van verbrande lichamen en kleine beentjes opgevuld; in sommige dier potten zijn, naar men meld, stukjes metaal en gedeelten van wapenen gevonden. De genoemde potten zijn bedekt door heuveltjes van verschillende hoogte, die, even als de potten waarschijnlijk naar het aanzien en den rang, welke de
- 59110 daar begravenen bekleed heeft, in grootte en hoogte hebben toegenomen. De potten zijn van pot-aarde en goed gedraaid; de grootste hebben eene middellijn van 3, de kleinste van ruim 1 palm; sommige heuveltjes zijn bijna 2, andere meer dan 5 voeten hoog.
- 3 juni 1837 [7] urnen of potten van verschillende grootte, allen met asch van verbrande lichamen en kleine beentjes opgevuld;

- 59170 12 mei 1840 **[brief aan de burgemeester van Deurne]**
Burgemeester van Deurne Liessel Helmond, den 12 Mei 1840
De Heer Gouverneur dezer provincie (waarschijnlijk door het bestuur van het
genoodschap ter bevordering van wetenschappen en kunsten in Noord Brabant daartoe
aangezocht) heeft mij een groot aantal vraagpunten ter beantwoording opgegeven
59175 betrekkelijk oudheden in mijn District.
deze vragen, voor zoover zij de gemeente Deurne Liessel betreffen zijn de navolgende:
volgens een medegedeeld bericht zoude een landbouwer van de Mortel genaamd, een
romeinsch zwaard en een goude schild bezitten, welke in den peul zoude zijn
uitgegraven.
59180 1°. Is dit werkelijk zoo? en in dat geval, wanneer en waar ter plaatse heeft men dat
zwaard en schild gevonden?
2°. Zoude er gelegenheid zijn om hetzelfde voor de verzameling van oud en
zeldzaamheden van het provinciaal genoodschap van kunsten en wetenschappen
aantekopen?
59185 3°. Zoo ja, tot welken prijs?
4°. Wanneer de eigenaar tot verkoop niet mogt kunnen besluiten, zoude hij dan die
voorwerpen tegen bewijs ter beoordeeling en afteekening willen overmaken?
5°. Is er gelegenheid om nog eenige der aldaar onlangs gevonden lijken of andere
aldaar opgegraven merkwaardigheden te koopen?
59190 6°. Hoe is de benaming der plaats waar die urnen opgegraven zijn?
Een eenigzins spoedig antwoord op deze vragen zal mij aangenaam zijn
D Distr.

59195 n° 1
Missive van 17 april 11 n° 8. / Antwoord op de missive van
afdeeling kunsten en wetenschappen / 17 april 11 no 8.
- Helmond den 29 Juny 1840.
- 59200 [Aan den gouverneur]
Bij de aangehaalde missive/missieve heeft UWEG mij eenige vraagpunten betrekkelijk
oude monumenten die zich in sommige gemeentens van mijn district/District zouden
bevinden, ter beantwoording opgegeven. Eenige dezer vraagpunten zoude ik dadelijk
59205 hebben kunnen beantwoorden, [doch] tot het bekomen van inlichtingen heb ik de
gelegenheid mijner rondreis waar genomen, als wanneer de leden van den raad
vergaderd zijnde, ik vermeende beter te kunnen geïnformeerd worden. Ik zal de volg
orde in acht nemen, zoo als zij in uwe missieve voorkomt.
[...]
- 59210 Gemeente Deurne Liessel.
~~Naar het bericht~~ Ik heb het bericht dat een landbouwer te Deurne Liessel in het bezit
zoude zijn van een ~~oud~~ romeinsch zwaard en een goud schild welk in den peul zoude
zijn uitgegraven, zeer betwijfeld, wijl ik er nooit iets van vernomen had. ook is mij
bij onderzoek ~~verzekerd~~ gebleken dat er niemand iets van weet. waarschijnlijk heeft
59215 men dit verward met ?? het geen in de naburige gemeente Meyel heeft plaats gehad. ~~In~~
~~het jaar 1807~~ men heeft ~~men~~ aldaar een goud schild gevonden. voor eenige jaren te
Meyel zijnde heb ik mij naar het huis van den toenmaligen burgemeester Goossens
begeven om deze merkw  digheid te zien. hij vertoonde mij een schild welk in den
peul in het jaar 1807 ~~met~~ trent vijf voeten onder ~~het onder~~ de oppervlakte van den
59220 grond ~~in den peul~~ bij gelegenheid eener turfgraving gevonden was, hetzelfde was van
goud of althans zwaar verguld ~~gedreven werk~~, op hetzelfde waren hyroglyphen en andere
figuren van leeuwen, tijgers &c gedreven, en had de vorm van een halve maan, veel
geleken naar een ringkraag zoo als de kapiteins der infanterie ~~voor~~ ? nog niet zeer
lang geleden op de borst droegen. de Heer van Keverberg, destijds sousprefet te
59225 Cleef, had dit stuk mede naar Parijs genomen en na zijne terugkomst, volgens zeggen
van den Burgemeester veel geld voor geboden, doch men was het over den prijs niet
eens kunnen worden. -
Er zijn te Deurne geene lijken meer verkrijgbaar. de Heer burgemeester zoude ~~door~~
trachten ~~er~~ door graving er nog te krijgen, welke hij alsdan, indien dit gelukken
59230 mogt gaarne zoude afstaan. -
De Districts Commissaris / DD.
Wesselman.

- 59260 36. Lans-spits van koper, met kopergroen bezet, bewerking en vorm als in G. A. Taf. XVII. Fig. 2, en aan het benedeneinde van twee gaatjes voorzien om a  eene schaft bevestigd te worden; afkomst, *Deurne*; geschenk van den Heer *van Riet*.
Lang 0,115 El.
- 59265 38. Lans-spits van ijzer; bewerking en vorm als in N. A. Taf. XVII. Fig. 1, van twee gaatjes voorzien als n. 36; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *van Riet*.
Lang 0,23 El.
- 59270 53a. Twee fragmenten van een' mantelhaak naar het schijnt, van koper en met kopergroen bezet; afkomst *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
- 59275 B.53b. Schijf van spiraalsgewijs gewonden koperdraad, met kopergroen bezet (fragment van een' mantelhaak); vorm als in G. A. Taf. 5 Fig. 1; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
- 59280 53c. Twee fragmenten eener koperen haarnaald, met kopergroen bezet; vorm nagenoeg als in G. A. Taf. 2 Fig. 4; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
- 59285 56a. Fragment van een' spiraalsgewijs gewonden ring naar het schijnt, van koper en met kopergroen bezet; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
Middelbare dikte 0,006 El.
- 59290 B.56b. Fragment van een' ronden armring (?) van koper, met kopergroen bezet; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
Dik 0,036 El.
- 59295 56c. Fragment van een' ronden armring (?) van koper, met kopergroen bezet; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
Dik 0,006 El.
- 59295 B.58A* Plat ringetje van graauwachtig roode aarde en fijne bewerking; hetzelfde heeft waarschijnlijk als hals- of oorring aan een' anderen ring gehangen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.
Middellijn 0,013 El; dikte 0,005 El.
- 59300 66a. Pot van donkerbruine aarde, vorm als Fig. 28, doch gebarsten; inhoud, verbrande

beenderen; afkomst *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
Hoog 0,16 El.

- 59305 C.74. Potje van bruine aarde, vorm als Fig. 29, doch zonder ooren; inhoud, aschachige aarde; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
Dit potje werd gevonden in den pot n. 81.
Hoog 0,095 El.

- 59310 74a. Pot van donkerbruin aarde; vorm, nagenoeg als Fig. 32, doch aan den rand beschadigd; inhoud, verbrande beenderen; afkomst *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
In denzelven bevond zich het potje n. 164.

- 59315 Hoog 0,25 El.
81. Potje van donkerbruine aarde, tamelijk fijne bewerking en vermoedelijke vorm als Fig. 32, doch de rand is afgebroken; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
59320 In denzelven bevond zich het potje n. 74.
Hoog 0.195 El.

82. Pot van donkerbruine aarde; vorm als Fig. 32; inhoud, verbrande beenderen en asch; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
59325 Hoog 0,24 El.

91. Pot van bruine aarde; vorm nagenoeg als Fig. 28, doch van boven geschonden; afkomst, *Deurne*, uit een Germaanschen grafheuvel; geschenk van den Heer van Riet.
59330 Hoog 0,16 El.

93. Pot van lichtbruine aarde; vorm nagenoeg als Fig. 37, doch van een oortje voorzien; inhoud, verbrande beenderen en asch, boven welke eenige fragmenten ruw aardewerk lagen, die oorspronkelijk tot een' schotel van 18 duim middellijn kunnen behoord hebben; afkomst, *Deurne*; uit een Germaanschen grafheuvel.
59335 Hoog 0,21 El.

98. Pot van donkerbruine aarde; vorm nagenoeg als Fig. 41, doch aan ééne zijde zeer geschonden; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Hr. van Riet.
59340 Hoog 0,245 El.

- C. 99. Pot van donkerbruine aarde; vorm nagenoeg als Fig. 41; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel.
59345 Hoog 0,205 El.

101. Pot van bruine aarde; vorm nagenoeg als Fig. 34; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
59350 Hoog 0,15 El.

- C. 109. Pot van donkerbruine aarde; vermoedelijke vorm als Fig. 34, doch boven ter helft geschonden; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer van Riet.
59355 Hoog 0,27 El.

119. Pot van bruine aarde; vermoedelijke vorm nagenoeg als Fig. 42, doch rand en ooren zijn weggebroken; versiering, 5 ruw ingekrabde lijnen boven den buik; inhoud, verbrande beenderen; afkomst, *Deurne*, uit een' Germaanschen grafheuvel, geschenk van den Heer van Riet.
59360 Hoog 0,16 El.

- C. 164. Potje van graauwe aarde, tamelijk fijne stof en ruwe bewerking; vorm nagenoeg als Fig. 67, doch aan ééne zijde geschonden; afkomst, *Deurne*, uit een' Germaanschen grafheuvel, gevonden in den pot n. 74*; geschenk van den Heer van Riet.
59365 Hoog 0,04 El.

195A en 195 B. Mortier en stamper van tufsteen; vorm als Fig. 20a en 20b; afkomst, Deurne; geschenk van den Heer *S. H. van der Noordaa*.
De mortier is hoog 0,075 El; breed 0,11 El.

59370 De stamper is lang 0,1555 El.

196A en 196B. Mortier en stamper van tufsteen; vorm als Fig. 20 a en b; versiering der zijden als a, c en d; afkomst Deurne; geschenk van den Heer *S. H. van der Noordaa*.

59375 De mortier is hoog 0,07 El, breed 0,13 El.

De stamper is lang 0,10 El.

209*. Bladvormig werktuig van gegoten koper en met kopergroen bezet, voorzien van eene gesplitste punt en drie kunstige gaatjes, en aan de zijden scherp, zie Gig. 16; misschien eene vorm tot bewerken van potten; afkomst, *Deurne*, uit een' Germaanschen grafheuvel; geschenk van de Heer *P. Guyot*.

59380 Oorspronkelijke middellijn van het geheel 0,045 El.

209a. Twee fragmenten koper, met kopergroen bezet, doch door verbranding misvormd; dezelve schijnen het mondstuk eener trompet te hebben uitgemaakt; afkomst *Deurne*, uit een' Germaanschen grafheuvel; geschenk van den Heer *P. Guyot*.

59385 Oorspronkelijke middellijn van het geheel 0,045 El.

24 februari 2014 Antwoord van Heikki Pauts van het Rijksmuseum te Leiden

59390 **2014: Over die mortieren en stampers hadden we vorige zomer al contact.**

Zoals ik toen al schreef zijn de betreffende objecten al in de 19de eeuw overgedragen naar Amsterdam (VdN a-f aan het Museum van het Koninklijk Oudheidkundig Genootschap in 1860, VdN g-k aan de toenmalige Rijksadviseur voor de Monumenten van Vaderlandsche Geschiedenis en Kunst in 1875). Ik weet niet zeker, maar ik denk dat die collecties

59395 later in het Rijksmuseum Amsterdam terecht zijn gekomen.

Hieronder nog samenvattend de informatie over de betreffende mortieren en stampers uit onze Inventarisboeken:

- februari 1839, inventarisnummers VdN a-b "Gevonden in Noord-Brabant, aan het museum van oudheden geschonken door den Hr. S.H. van der Noordaa te Dordrecht.

59400 **a) Vijzel met stamper, uit graauwen tufsteen;**

waarschijnlijk tot het fijnwrijven van koren; (welligt ook om de geringere grootte ter bereiding van mostaard). De vijzel is van buiten vierkant doch aan de hoeken eenigszins bijgerond; van binnen bolvormig uitgehold.

59405 **b) Stamper is van boven vierkant, doch loopt onder conisch kegelvormig toe,**

eenigszins gelijkende naar eenen omgekeerden cippus met voetstuk.

Over deze beide voorwerpen geeft de Heer v.d. Noordaa in Zijnen brief dd. Dordrecht 17 Dec. 1838 aan Dr. L.J.F. Janssen het volgende berigt:

59410 "Doch ook werd aan mij toegezonden een vijzeltje en een stamper van bazalt, omtrent van vorm als die ik bezit, met dit onderscheid alléén dat de eerste bij mij bekomen

vijzel en stamper bij elkaar schijnen te behooren, terwijl de stamper U gezonden voor den daarbij toegeschikten vijzel wat te groot is. Beide vijzels, beide de stampers zijn van bazalt, van die soortzoo als ze aan den Rijn voorkomt. Men heeft aan die voorwerpen met de minste moeite dien vorm gegeven welke de natuurlijke draad van den steen aanwees. Deze oudheden zijn niet gevonden aan de bewuste begraafplaats te

59415 Deurne; maar nu eenige jaren geleden aldaar in het land en in eenen tuin, de laatst toegezonden vijzel en stamper zijn zelfs afkomstig van verschillende plaatsen onder Deurne en van verschillende personen. Er zijn in dien omtrek meer soortgelijke ruwe huismeubels geweest, groter en kleiner, vroeger en later gevonden, doch die weder zijn verstrooid geraakt. Een mijner broeder vroeger bij de Lanciers, thans door

59420 zwakke gezondheid buiten eenige betrekking en wondende te Deurne heeft de bedoelde vijzels voor mij opgespoord. Hij doorkruiste de Majorij in alle rigtingen, hij is

daar overal bekend, ook ik zelve zoude 's nachts er aan vele plaatsen den weg vinden, en nogthans is het om niet mogen gelukken na alle nasporingen soortgelijke vijzels

59425 ergens elders in Noord-Brabant, dan juist in den omtrek van Deurne te ontdekken alwaar die dan ook wel stellig zeker alléén zijn gevonden en bekend zijn geraakt,

want zoo als ik zeide men heeft er daar meer gehad. Over dit verschijnsel nadenkende, is het mij voorgekomen dat deze gereedschappen zouden kunnen afkomstig zijn van denzelfden volkstam die er zijne overledenen aan de ontdekte begraafplaats heeft nagelaten".

59430 - november 1839, inventarisnummers VdN c-d "Gevonden in den omtrek van Deurne en aan het Museum geschonken door S.H. van der Noordaa, Substit. Griffier te Dordrecht.

c) Een vijzel van tufsteen, vierkant van gedaante en van buiten

van eenige versiering voorzien, als aan elk der hoeken een colommetje, terwijl de vier velden tusschen deze colommetjes in ruiten en driehoeken zijn afgedeeld. Van die vier velden zijn er twee (welke tegen elkaar over staan) dus behouwen: [tekening] het derde heeft regtstaande, en het vierde verschoven ruitjes, als: [tekening] inwendig is dezelve rond uitgehold.

d) Stamper van dezelfde steensoort, aan het bovineinde vierkant en beneden rond. Dezelve is te klein dan dat hij oorspronkelijk tot bovengenoemden vijzel zoude hebben behoord.

Het is opmerkelijk dat deze en soortgelijke vijzels in zoo groot getal in de omstreek van Deurne Lijsel en Asten, gelijk de Hr. vdNoordaa mij (Dr. Janssen) mondeling verzekerde, gevonden zijn en wel binnen den omtrek van een uur, terwijl men ze elders in Noord-Brabant, volgens 's mans verzekering, nog niet heeft aangetroffen".

- october 1842, inventarisnummers VdN e-f "Gevonden in den omtrek van Deurne en aan het Museum geschonken door S.H. van der Noordaa te Dordrecht.

e) Een mortier van tufsteen, langwerpig-vierkant van gedaante en tamelijk ruw bewerkt.

f) Twee stukken ijzererts naar het schijnt, gevonden in eene urn.

- juni 1863, inventarisnummers VdN g-k "Gevonden in den omtrek van Deurne, afkomstig uit de verzameling van wijlen den Heer S.H. van der Noordaa, en van diens zoon, Mr. v.d. Noordaa te Dortrecht, voor het Museum van Oudheden overgenomen.

g) Mortier van trachijsteen, van binnen rond, van buiten achtzijdig, en versierd met gothische nissen, in reliëf; in twee dier nissen is het jaartal 1393 ingebeiteld, en in twee andere zijn de letters A en H, denkkelijk door eene latere hand, ingekrabd. De vorm is p.m. [tekening]

h) Stamper van trachijsteen, behoorende bij de mortier VdN g, vorm p.m. [tekening]

i) Mortier als VdN g, doch vierkant van vorm, met vier pilasters aan de buitenzijde, als VdN h.

k) Stamper, als VdN h, en behoorende bij de mortier VdN i.

31 december 1865 Als aanvulling vinden we nog enkele elders niet genoemde details in het boek Noord-Brabants Oudheden (facsimile van 2012):

Met een dertigtal liefhebbers zijner compagnie toog hij naar de heide te *Deurne* en had weldra de overtuiging, dat die verhevenheden lijkheuvelen waren. Deze zijn ongelijk van hoogte, daar eenige slechts 60 duim, en andere 7,60 el. Nog waren op eenen grooteren of kleineren omtrek naar gelang der hoogte. Er zullen een honderdtal urnen gevonden zijn, van de groote eens theekops tot 100 pd. zwaar. [...]

In het voorjaar van 1840 ben ik met wijlen Dr. Niermeijer, later professor te *Leiden*, deze heide wezen bezoeken en vond de heuvels nog zóó als toen men ophield met dit schatgraven! [...]

In het Rijks-Museum te *Leiden* worden dertien urnen en bijpotjes, bij Jhr. Mr. H. de Grez te 's *Hertogenbosch*, vier urnen en bijpotjes (1) en in het kabinet van het Noord-Brabantsch Genootschap twee urnen en een bijpotje bewaard.

(1) Onder het afdrukken van dit bericht verplichtte mij de heer de Grez met die goed bewaarde urnen aan ons kabinet ten geschenke aan te bieden.

1 januari 1841 **VERHANDELING over de in Noord-Brabant ontdekte Germaansche Begraafplaatsen.**

[262] "De Grafheuvel en de daarin gevondene merkwaardigheden mogen in den eersten opslag, het voorkomen van weinige beteekenis hebben, dit vooroordeel zal weldra afgelegd worden, wanneer men tot zijne verbazing ontdekt, dat zulk een op zich weinig beduidend toeval zoo veel stof aanbiedt, om de Schriften der ouden te verstaan, en over de oudste geschiedenis en volksgebruiken zulk een licht verspreidt." Westendorp.

Noord-Brabant is rijk in overblijfsels van den voortijd, en bezit vooral nog zeer veel in hare volksbegrippen, volksgebruiken en volksverleveringen, dat voor den oudheidkundige onschatbaar is, en hem tot eene meer grondige kennis kan doen komen van het volk, 't welk de oorlogende Romeinen het eerst leerden kennen en in ruwe trekken afmaalden.

In de voorgaande afleveringen van het *Mengelwerk* hebben wij reeds eenige berigten deswege medegedeeld, en de bijval, welke dezelve bij vele lezers gevonden [263] hebben, moedigt mij aan, om onze overige navorschingen

1°. omtrent de goden en dezelve tempels,
2°. " de gewijde bosschen,
3°. " de heilige boomen,

59500 4°. " de heilige bronnen,
5°. " de heidensehe begraafplaatsen
van tijd tot tijd mede te deelen.
Wij kiezen thans de heidensche begraafplaatsen ter beschouwing, die ontdekt zijn:
1°. te Orten bij 's Hertogenbosch,
59505 2°. " Alphen in de baronie van Breda,
3°. " Mun onder Oss,
4°. " Deurne bij Helmond,
5°. " Gemonde bij St. Michiels-Gestel,
6°. " Genderen (land van Heusden),
59510 7°. " Engelen " " "
8°. " Tilburg,
9°. " Haren bij Megen.
Deze opgaven zullen wij doen vergezeld gaan van die bijzonderheden, welke onze
vaderen voornamelijk den kennen bij het plegtige tijdstips des verscheidens, en of
59515 uit middeleeuwsche oorkonden, of uit de taal, of uit den mond des volks bijeengebragt
zijn. De uitvoerigheid dezer verhandeling zal, hopen wij, om de verscheidenheid en
nieuwheid van vele onzer opmerkingen, bij den lezer gereedelijk verschooning vinden.

[273] **BEGRAAFPLAATS TE DEURNE.**

59520 De begraafplaats uit den heidenschen voortijd, welke in 1837, in de heide 20 minuten
van Deurne, ontdekt werd, en waaruit wel 100 urnen gegraven zijn, heeft veel gerucht
gemaakt. In het voorjaar van 1840 heb ik mij derwaarts begeven, om met eigene oogen
dit ke  op te nemen, en na gedaan  erzoek bevonden, dat de berigten, door Dr.
Jansen  den *Konst- en Letterbode* (a)  plaatst, allernaauwkeurigst zijn, weshalve
59525 wij het zakelijke berigt met de woorden van dezen oudheidkundige zullen overnemen.
De heer F. baron van Voorst tot Voorst, ritmeester bij het regiment Huzaren N. 6. te
Somerens gecantonneerd, vond al jagende in de omstreken van onderscheidene dorpen, zoo
ook te Deurne, in de hoogste punten der heide, [274] regelmatige verhevenheden, die
hij veronderstelde, dat in vroegere tijden een doel gehad moeten hebben. "Ik dacht",
59530 zoo schrijft zijn Hoog wel geboren, wiens woorden wij verder laten volgen, "ik dacht,
na den jagdtijd wil ik weten, wat daar in zit; sprak er met den Burgemeester over,
die bereidwillig de vergunning tot het opgraven gaf. Met een dertigtal liefhebbers
der kompagnie, waarbij ik sta, aan het werk gegaan, vonden wij in een paar uren tijds
vier urnen, van verschillende gedaanten en grootte, waarvan er drie gebarsten waren,
59535 en die met het opheffen uit een vielen. Alle waren, als ook de nadere gevondene, met
verbrande menschenbeenderen tot op de helft gevuld. Het aanvulsel is eene compacte
zwarte aarde, misschien vroeger asch en houtskool... Wanneer men bij het graven
houtskool ontdekte, wan was de urne niet ver af te vinden."

"Zelden vond men menschenbeenderen zonder urnen. Van de menschenbeenderen zijn
59540 stukken van schedels, ribben en vooral de ronde hoofden der dij- en opperarmbeenderen
nog duidelijk te onderkennen... Ik beschouw dezelve uit de hand gemaakt, ten minste
niet zoo als thans gedraaid en slecht gebakken, dat bij het doorbreken der scherven
op de kanten te zien is. De kleur is bij eenige als chocolade, bij andere
grauwachtig. Twee waren ligt rood en eene scheen ruw verglaasd. daags na mijn begin
59545 waren eenige boeren en burgers ook begonnen, om een door den Ritmeester aangeduiden
schat te zoeken, en weldra twee honderd boeren bezig, om alles zonder orde of overleg
ten onderste boven te keeren. Goede raad kon niet baten. Naderhand werd dit door
eenigen begrepen. De aarde heeft een en half spit die vast en bruinheid... welke zij 
59550 elders bezit. Dieper [275] spittende bespeurt men weldra dat de grond vroeger (niet?)
geroerd is geweest."

"De urnen, die in geel zand zitten, zijn gaver, witter en helderder van kleur, dan
die in den grond, welke op teelaarde gelijkt. Die, welke in den vlakken grond worden
aangetroffen, zitten zelfs minder dan een voet diep; in de heuvels $2\frac{1}{2}$ tot 3 voet; de
59555 eene urne boven de andere; bij grootere ook wel kleinere, of daarin orgen, als de
kraamvrouw met haar kind. - Ik had de grootste heuvels onderzocht (a) n de
veronderstelling, dat dit de graven der voornaamste personen zouden zijn. Wanneer dit
niet meer dan een gewoon kerkhof van dien tijd is geweest, dan kunnen dit familie-
graven geweest zijn, hetwelk men geneigd is te gelooven, wanneer men de urnen met
59560 eenige tusschenruimte boven elkander zag geplaatst; waardoor die bergjes
achtereenvolgens die hoogte verkregen, welke door verloop van tijd veel van derzelver
hoogte, door regen, droogte en wind moeten hebben verloren. - Op eenige urnen is
verbrand metaal gevonden; al zeer gering (echter) in vergelijking van de
uitgestrektheid opgeworpen grond, die thans eene woestijn gelijkt... Deze
59565 begraafplaats wordt door een voetpad op Astendoorsneden, liggende op 20 minuten
afstands van Deurne; zij zal op het oog geschat, 150 passen breed, en 500 land

zijn... Er zullen ruim een honderdtal urnen gevonden zijn van verschillende gedaante en grootte, waarvan een 2/3 gedeelte beschadigd was, van de grootte eens theekops af tot 100 pd. zwaar. Zij worden van f1 tot f4 verkocht... Ik moet nog bijbrengen, dat niet [276] geheel ver van de begraafplaats eene lange breedte sloot bestaat, waarvan het doel niet is te begrijpen, die noch tot vervoer (tenzij aanvoer van drinkwater). noch tot omsluiting, noch grensscheiding kan hebben gediend."

Tot zoo ver deelt Dr. Jansen bovenstaande merkwaardige berigten mede met de woorden van den baron van Voorst zelven, getrokken uit eenen brief gedagteekend: *Someren 25 Maart 1837*, die er tot lof van den geëerden ontdekker bijvoegt: "Ziet men uit dit belangrijk berigt, dat de heer van Voorst de eerste was, die de ontdekking maakte: men zal hem tevens den lof niet kunnen weigeren, dat hij daarbij oordeelkundiger en naauwkeuriger is te werk gegaan, dan men van iemand, die deze soort van nasporing niet tot zijne bijzondere studie maakte, had mogen verwachten; men zal hem erkentelijk zijn, dat hij gelet heeft op bijzonderheden, die bij eene wetenschappelijke beoordeeling niet gemist kunnen worden."

Toen ik te Deurne was, werd mij verhaald, dat reeds vóór dertig jaren een schaapsherder eene urne met menschen-beenderen gevonden had, doch dat hij die als overblijfsels van eenen manslag beschouwd en, om met de politie in geene aanraking te komen, de zaak stil gehouden en de beenderen met de potscherven weder in den grond gestopt had.

Beschouwen wij thans de voorwerpen, welke in deze Germaansche begraafplaats ontdekt zijn. Dezelve zijn van drieërlei aard, als:

1°. Een honderdtal urnen.

2°. Eenige metalen versierselen.

3°. Een drietal verdachte voorwerpen.

[277] I. LIJKURNEN.

In het Rijks Museum van oudheden te Leiden worden bewaard:

1°. Een gebarsten pot van donker bruine aarde, met verbrande beenderen. Hoog 0,16 el. (zijnde N°, 66a der verzameling van oudheden.)

2°. Potje van bruine aarde, met aschachtige aarde. Hoog 0,095 el (N°. C. 74). Dit potje werd gevonden in een

3°. Pot van donkerbruine aarde, zijnde tamelijk fijn bewerkt, doch aan den rand geschonden, met verbrande beenderen. Hoog 0,195 el. (N°. 81.)

4°. Pot van donkerbruine aarde, aan den rand beschadigd, met verbrande beenderen. Hoog 0,25 el. (N°. 74a). In denzelfden bevond zich een

5°. Potje van graauwe aarde, tamelijk fijne stof en ruwe bewerking, doch aan ééne zijde geschonden. Hoog 0,04 el. (N°. C. 164.)

6°. Pot van donkerbruine aarde; vorm als Fig. 3 der bijgaande plaat, met verbrande menschen beenderen en asch. Hoog 0,24 el. (N°. 82.)

7°. Pot van bruine aarde; doch van boven geschonden. Hoog 0,16 el. (N°. 91.)

8°. Pot van lichtbruine aarde, met één oortje voorzien, en met verbrande beenderen en asch, boven welke eenige fragmenten ruw aardewerk lagen, die oorspronkelijk tot een' schotel van 18 duim middellijn kunnen behoord hebben. Hoog 0,2 el. (N°. 93.)

9°. Pot van donkerbruine aarde, aan ééne zijde zeer beschadigd, met verbrande beenderen. Hoog 0,245 el. (N°. 98.) [278]

10°. Pot van donkerbruine aarde, met verbrande menschen-beenderen. Hoog 0,205 el. (N°. C. 99.)

11°. Pot van bruine aarde, met verbrande beenderen. Hoog 0,15 el. (N°. 101.)

12°. Pot van donkerbruine aarde, doch boven ter helft geschonden, met verbrande beenderen. Hoog 0,27 el. (N°. C. 109.)

13°. Pot van bruine aarde, waarvan de rand en ooren weggebroken zijn, met vijf ruw ingekrabde lijnen boven den buik, met verbrande beenderen. Hoog 0,16 el. (N°. 119.)

De omschrijving dezer 13 lijkurnen is overgenomen uit *Dr. Jansen, de Germaansche en noordsche monumenten van het Museum te Leiden* (Leiden 1840), met opgave der Nummers, waaronder zij in de verzameling voorkomen.

Nog hebben wij het genoegen van twee urnen te gewagen, die door den baron van den Bogaerde van ter Brugge aan het Provinciaal Genootschap te 's Hertogenbosch geschonken zijn, en op de Boekerij van dat Genootschap bewaard worden.

1°. Pot van donkerbruine aarde, in den rand eenigzins beschadigd. Hoog 0,16 el. (Zie Fig. 2.) In deze urne werd gevonden een

2°. Potje mede van donkerbruine aarde, hetwelk veel geleden heeft. Hoog 0,073 el. (Zie Fig. 4.)

Laat ons thans de geleerde aanmerkingen van den heer Jansen overnemen, zoo als die in den Letterbode voorkomen.

"De bestemming der urnen", zegt hij "is aan geene bedenking onderworpen; zij waren

geheel of ten deele met verbrande menschen-beenderen gevuld, boven welke [279] met houtskolen en asch gemengde aarde; het waren dus dooden-urnen, die 't laatste overschot der verbrande lijken bevatteden. Minder bepaald is de bestemming der kleine
59635 potjes, die soms, boven op, soms binnen in en soms naast de urnen gevonden worden. Als zeker zal men slechts die voor kinder-urnen houden mogen, bij welks de beendertjes zulks uitwijzen. De ons bekend gewordenen hebben het niet bewezen. Deze "(zijnde vijf stuks door den Heer Jansen onderzocht) "bevatteden eene geele, soms graauw, van asch gemengde aarde, terwijl slechts één en schelfertje been in zich
59640 hield. De jongste oudheidkundige ontdekkingen, bij soortgelijke elders ontdekte potjes, hebben aangetoond, dat sommige gediend hebben, om iets tot nut of sieraad des levens in te leggen. Tegen het veelal omhelsd gevoelen, dat zij steeds de asch der kraamkinderen zouden bevatten, strijdt onder andere ook het zeer groot getal van deze, zoo wel te Deurne als elders gevondene bij-potjes."
59645 "Dat de urnen en potjes zeer onderscheiden zjn in grootte, gedaante en uitwenig vertoon, is opgemerkt, en ook aan ons gebleken. De hoogte en wijdte staan niet in evenredige verhouding, maar alle hebben eene wijde opening, die geschikt is tot het inleggen van voorwerpen, en gelijken eene gewone tobbe, terwijl geene enkele kruikvormig is. Zeldzaam schijnen die, thans op het Museum alhier aanwezig, was er
59650 slechts eene, gedekt met brokstukken eener groote schaal of tobbe, noch opzettelijk tot bedekking vervaardigd, noch ook op de urne sluitende. Volgens afbeeldingen is er echter eene ontdekt, waarvan het deksel binnen de urne beter sloot, en eene waarbij het over den rand uitstak. Ook [280] hebben slechts weinige één of twee oortjes en nog zeldzamer schijnen die te zijn voorgekomen, die eenige versieringen hadden, eene
59655 versiering echter, die naauwelijks dien naam mag verdienen. Bij eene in ons Museum aanwezige bestaat zij in vijf lijnen, die onevenredig onder elkander rondom den rand der urne loopen, en er met een puntig werktuig zijningeschrabt, toen de aarde nog week was. Volgens afbeeldingen is er echter ook eene ontdekt bij welke die lijnen regtstandig naast elkander en eene andere, bij welke zij kruislings van malkander om
59660 de urne liepen. De kleur der bij onze geziene, is eene gemengde bruine, nu meer in graauw dan in geel of rood spelende, na gelang van de aarde, waaruit zij gevormd zijn, en den graad der warmte tot bakking aangewend. Sommige zijn uitwendig tamelijk glad gestreken of gewreven, doch aan geene heb ik sporen van glasuur of verw kunnen ontdekken. Het meest opmerkenswaardig schijnt de ruwe bewerking. De stof is weinig
59665 bereid en gezuiverd; de vorming waarschijnlijk uit de hand, niet op eene schijf geschied; dit althans blijkt duidelijk bij de kleine potjes en de brokstukken van het bovengenoemde deksel. De groote broosheid, die men bij sommige der geschondene potten bespeurt, doet met regt vermoeden, dat zij weinig gebakken, welligt slechts bij het vuur gedroogd zijn; aan welke broosheid het mede is toe te schrijven, dat zoo weinige
59670 ongeschonden aan het licht gekomen zijn. Wanneer men dit ruwe en zoo geringe kunstvordering aantoonende karakter van het aardewerk overweegt, kan men niet gelooven, dat dit van hetzelfde volk afkomstig zoude zijn, hetwelk de keurig bewerkte metalen (waarvan straks) vervaardigd heeft. Bij het aardewerk aan Romeinschen [281] arbeid te denken, verbiedt ons eene opzettelijke vergelijking met soortgelijke
59675 voorwerpen van Romeinsche afkomst. Het Romeinsche aardewerk, ook het eenvoudigste, ook het in de armste graven ontdekte, vertoonde ons steeds die fiksche bewerking, die evenredige, door geoefende schijfdraaiingen ontstane vormen, die vaste bakking, die bestemde kleuren en juiste versieringen, welke wij bij het onze missen."

59680 II. METALEN VERSIERSELEN.

In het Rijks-Museum te Leiden worden bewaard:
1°. Beitelte van koper, met kopergroen bezet. Lang 0,087 el. (N°. 21a.)
2°. Beitelte van koper, met kopergroen bezet. Lang 0,062 el. (N°. 21b.) Zie Fig. 5.
3°. Beitelte van koper, met kopergroen bezet; doch de waaijer zeer beschadigd. Lang
59685 0,067 el. (N°. B. 21c.)
Dr. Jansen geeft in bedenking, of deze beitels geene pottebakkers gereedschappen geweest zijn. Zoo dit waar is, moeten de urnen op de begraafplaatsen zelve gevormd en gebakken zijn, hetwelk niet onmogelijk is. Ik stel mij intusschen de zaak zoo voor, dat destijds een pottebakker zal belast geweest zijn met het maken der urnen, even
59690 als thans een kistemaker, of de eene of andere godsdienstige of weldadige inrigting met het maken der lijkkasten, zoodat de pottenvormer even zoo min zijne beitels, als thans een kistemaker zijne gereedschappen met de kist zal hebben afgeleverd. Daar de kennis, die wij van Germaansche begraafplaatsen hebben, nog zoo jong en weinig ontwikkeld is, komt het mij voor, dat de tijd nog niet gekomen is, om het doel en het
59695 ge- [282] bruik aan te wijzen der bij lijk-urnen gevonden wordende werktuigen. Beschrijven wij liever naauwkeurig en geven wij juiste afbeeldingen van het gevondene, waardoor de oudheidkundige na ons genoegzamen voorraad verkrijgen zal, om

- door vergelijking van vele gelijkvormige voorwerpen, een juister denkbeeld te geven van het doel en gebruik, als dit bij de kindschheid der Noordsche Archeologie doenlijk is. Het spreekt echter van zelve, dat men verpligt is, om de voorwerpen voorloopig eene benaming te geven, wil men van dezelve spreken; doch dit geschiede voorwaardelijk, tot dat die ons nader bekend zullen zijn geworden; uit dien hoofde billijken wij de benamingen, die de geleerde Jansen aan de te Deurne gevondene voorwerpen geeft, en nemen wij die gaarne over.
- 59700 4°. Lans-spits van koper, met kopergroen bezet, aan het beneden einde van twee gaatjes voorzien, om aan eene schaft bevestigd te worden. Lang 0,115 el. (N°. 36.)
- 59705 5°. Lans-spits van ijzer, van twee gaatjes voorzien. Lang 0,23 el. (N°. 38.)
- 6°. Twee fragmenten van eenen mantelhaak naar het schijnt, van koper en met kopergroen bezet. (N°. 53a.)
- 59710 7°. Schijf van spiraalsgewijs gewonden koperdraad, met kopergroen bezet; (fragment van eenen mantelhaak). (N°. 53b.)
- 8°. Twee fragmenten eener koperen haarnaald, met kopergroen bezet (N°. 53 c.)
- 9°. Fragment van een' spiraalsgewijs gewonden ring naar het schijnt, van koper en met kopergroen bezet. Middellbare dikte 0,006 el. (N°. 56 a.)
- 59715 10°. Fragment van een' ronden armring (?) van koper, met kopergroen bezet. Dik 0,036 el. (N°. B. 56b.)
- [283]
- 11°. Fragment van een' armring (?) van koper, met kopergroen bezet. Dik 0,006 el. (N°. 56c.)
- 59720 12°. Bladvormig werktuig van gegoten koper, met kopergroen bezet, voorzien van eene gesplitste punt en drie kunstige gaatjes en aan de zijden scherp (zie fig. 6). Dr. Jansen gist, dat het misschien eene vorm is tot het bewerken van potten. Lang 0,017 el (N°. 209*.)
- 13°. Twee fragmenten koper, met kopergroen bezet, doch door verbranding misvormd; dezelve schijnen het mondstuk eener trompet te hebben uitgemaakt. Oorspronkelijke middellijn van het geheel 0,045 el. (N°. 209a.)
- 59725 Behalve deze metalen versierselen is in het Museum te Leiden nog een
- 14°. Plat ringetje van graauwachtig roode aarde en fijne bewerking; hetzelfde heeft waarschijnlijk als hals- of oorring aan een' anderen ring gehangen. Middellijn 0,013 el; dikte 0,005 el. (N°. B. 58a*.)
- 59730 Wij hebben de opgave dezer veertien versierselen, welke in lijkheuvelen te Deurne gevonden zijn, gedaan met de woorden van Dr. Jansen (*Germ. en noordsche monum. van het Museum te Leiden*).
- De meeste dezer voorwerpen had zijn Ed. zeer geleerde reeds in den Letterbode (1838. I. 390) doen kennen, alwaar nog van vier metalen versierselen gemeld wordt. Na deze opgave zegt Jansen:
- 59735 "Voor zoo verre wij weten, is het opgenoemde al het metaal, dat uit het groote aantal heuvelen is aan het licht gebracht, en wekte deze zeldzaamheid met regt de bevreemding van den heer van Voorst; zoo verdient het tevens opmerking, dat er geene voorwerpen van edele metaal, van goud of zilver, en waarschijnlijk ook [284] niet eens van ijzer (a) ontdekt zijn. De bewerking dezer voorwerpen is zeer zorgvuldig en naauwkeurig; zij zijn deels gegoten, deels geslagen en getrokken, en, ofschoon van beeldwerk ontbloot, verraden zij eenen zeer gevorderden trap van kunsttoefening, en wijzen op een volk, dat op eene aanzienlijke hoogte van beschaving moet hebben
- 59745 gestaan. Neemt men den vorm en de beteekenis in aanmerking, vergelijkt men dezelve met gelijksoortige voorwerpen van stellig Romeinschen oorsprong, zoo ontwaart men de meest in het oog loopende overeenkomst, eene overeenkomst die ons althans zoo groot is voorgekomen, dat, zoo wij dezelve tusschen Romeinsche voorwerpen hadden gevonden, er geene enkele twijfeling zoude overblijven, dat zij uit eene Romeinsche fabriek afkomstig waren."
- 59750 Dat deze vordering in beschaving - welke Dr. Jansen uit de gevondene voorwerpen afleidt, bij de in- en ombewoners van Deurne tijdens het heidendom reeds bestaan te hebben - werkelijk aldaar bestond, toen de H. Willebrord benevens den H. Lambertus de inwoners van Peelland, tot het christendom bekeerde, zal ten klaarste blijken uit
- 59755 onze verhandeling: *De H. Willebrord en de H. Lambertus in Noord-Brabant*, uit charters en gelijktijdige oorkonden opgemaakt, welke wij in eene volgende aflevering van dit Mengelwerk zullen mededeelen.

III. VERDACHTE VOORWERPEN.

- 59760 De baatzucht of minachting, voor al wat den kortzigtigen mensch vreemd is, den oudheidkundige steeds tracht te verschalken, heeft men te meermalen, tot mer- [285] kelijk nadeel der Archeologie, ondervonden, dan dat men te Deurne ook dergelijke kunstenarijen niet zou hebben trachten aan te wenden. Toen ik mij in persoon te

- Deurne met nasporingen bezig hield, stond ik aan dezelfde bedriegerij bloot. Men bood mij een ijzeren beeldje te koop aan, dat alle blijken droeg, van vroeger tot een heft van een mes te hebben gediend. Op mijne vragen kreeg ik zulke ontwijkende antwoorden, en de verkooper werd zo zeer gedecontanceerd, dat ik hem afwees met eene houding, die hem duidelijk deed gevoelen, dat ik hem voor eenen lagen en baatzuchtigen bedrieger hield.
- In den Letterbode spreekt de heer van Voorst:
 1°. van een metalen beeldje, met platte vierkante hoofddekking, zijnde een span lang, en gekleed als b. v. Erasmus te Rotterdam, met gevouwen handen, waarin duidelijk een rozenkrans te onderkennen is. "Zoo dit beeldje werkelijk opgegraven is", schrijft de heer van Voorst, "dan is 't denkelijk van lateren datum."
- 2°. Van eenen sabel of kling. "Maar zoo deze, zegt Dr. Jansen, ook al te Deurne mogt opgedolven zijn, gelijk men den heer van Voorst, volgens aan mij gerigte missive, had verzekerd, behoort zij echter geenszins tot de grafheuvelen; daar zij ons bij onderzoek gebleken is van zoo jeugdigen tijd te zijn, dat zij niet eens aan de middeleeuwen reikt. Derzelver beeldwerk en verduisterd opschrift geeft de overtuiging, dat zij den tijd van Lodewijk XIV niet kan te boven gaan. Klingen uit de vorige eeuw, nog geene honderd jaren oud, en uit Amsterdamsche fabrieken, hebben met deze Deurnesche de treffendste overeenkomst."
- [286]
- 3°. Van eenen ijzeren bout of hamer. "Deszelfs bezitter, de heer P. Guyot te Nijmegen, zegt Dr. Jansen, berigtte mij, dat hij het niet der moeite waard geacht had, deze ter bezigtiging over te zenden, aangezien hij te kennelijke blijken droeg van een' gewone grendel uit zeer jeugdigen tijd te zijn."
- Wij eindigen deze berigten wegens de Germaansche begraafplaats te Deurne, met den wensch, dat de bezitters van daar opgegravene oudheden mogten worden opgewekt, om dezelve, tegen behoorlijke schadeloosstelling, af te staan aan het Provinciaal Noord-Brabandsch Genootschap te 's Hertogenbosch.
- Fig. 2-6. Oudheden te Deurne gevonden.
- 1 januari 1841 **Deurne is een net en welvarend dorp met eene sierlijke kerk** en eenen fraaijen toren, bij de roomschen in gebruik. Het kasteel te Deurne is nog in zijnen oudentoestand en een aangenaam verblijf. Schuins tegenover hetzelfde ligt nog een gedeelte van een ander kasteel of huizing, alwaar eenmaal de wieg stond van den natuurkundigen Joannes Florentius Martinet, die naar de getuigenissen van Uilkens meer dan iemand heeft bijgedragen, om de natuurlijke historie onder onze landgenooten te populariseren. Deurne heeft met *Liessel* eene bevolking van 3,256 inwoners, die zich generen met den landbouw en het steken van den peelturf. Te Deurne is in het jaar 1837 een germaansch kerkhof uit den heidenschen voortijd ontdekt geworden. Men zeide ons, dat de heer F. baron van Voorst tot Voorst, ridmeester bij het regiment huzaren, het eerst deze grafheuvels ontdekt heeft. Voor dertig jaren had een schaapherder wel eene urne met gebrande menschenbeenderen gevonden, doch, daar hij die als het overblijfsel hield van eenen manslag en voor de politie beducht was, had hij de zaak stil gehouden, en de beenderen met de potscherven weder in den grond gestopt. De begraafplaats wordt door een voetpad op Asten doorsneden, liggende rondom in de heide, en 20 minuten van Deurne, hebbende nagenoeg eene lengte van 500 en eene breedte van 150 passen. Men had ongeveer 100 lijkbussen van allerlei groote uitgegraven. Dit heidensch overblijfsel gaf ons ruime stof, om het eentoonige der heide te doen vergeten.
- 26 januari 1841 **Bij de afdeeling der Germaansche en Noordsche oudheden,** van den Generaal Majoor Rottiers, aan wiens ijver en zorg het Museum het bezit van zoo vele Grieksche kunststukken te danken heeft, een bronzen Goden-beeldtje, in den omtrek van Aken gevonden.
- Van den heer P. O. P. Guyot, te Nijmegen, eene allerbelangrijkste verzameling van bronzen en andere voorwerpen bij Deurne, in de provincie Noord-Brabant, opgedoken, en die voor het grootste gedeelte door den heer Ritmeester Baron van Voorst bijeengebragt, en aan den heer Guyot afgestaan waren. Door deze aanzienlijke aanwinst, vereenigd met de urnen en andere voorwerpen, waarvan wij in onze vorige berigten (*Staats-Courant* 1838 en 1839) gewaagden, is het Museum thans in het bezit gesteld van de voornaamste en zeldzaamste stukken, die bij de ontdekking te Deurne gedaan, voordien dag zijn gekomen, en die, langs verschillende wegen, eindelijk wederom bij elkander gebragt, een geheel vormen, dat tot de kennis van een der oude volksstammen, die vroeger ons land bewoonden, eene zoo onverwachte als aanzienlijke bijdrage leveren kan. In den *Konst- en Letterbode* 1838, Mei. pag. 379-395, zijn de

- 59830 meeste der voorwerpen door den heer Conservator Dr. Janssen, beschreven.
- 25 februari 1842 M. P. O. P. Guyot à Nymègue d'une collection très-remarquable de bronzes et d'autres objets trouvés près de Deurne dans le Brabant-Septentrional et qui pour la plupart avaient été rassemblés par M. le capitaine baron Van Vorst qui les remis à M. Guyot. Cette importante acquisition jointe aux urnes et autres objets
- 59835 dont il a été rendu compte en 1838 et en 1839, met le Musée en possession des principaux et des plus rares résultats de la fouille près de Deurne. Toutes ces découvertes éparses, réunies maintenant, forment un ensemble qui pourra jeter un grand jour sur la connaissance des anciens peuples qui ont habité jadis notre pays.
- 59840 La plupart de ces objets sont décrits par M. le conservateur Janssen dans le *Konst- en Letterbode* de 1838, pages 370--395.
- 26 januari 1841 [13] Van den heer P. O. P. Guyot, te Nijmegen, eene
- 59845 allerbelangrijkste verzameling van bronzen en andere voorwerpen bij Deurne, in de provincie Noord-Brabant, opgedolven, en die voor het grootste gedeelte door den Ritmeester Baron van Voorst bijeengebracht, en aan den heer Guyot afgestaan waren. [14] is het Museum thans in het bezit gesteld van de voornaamste en zeldzaamste stukken, die bij de ontdekking te Deurne gedaan, voor den dag zijn gekomen, en die, langs verschillende wegen, eindelijk wederom bij elkander gebragt, een geheel vormen, dat [...]

59935

Eenige MIDDELEEWSCHEN EN LATERE VOORWERPEN, afkomstig uit de ontgravingen voor de legerplaats te Nijmegen, een paar trachietsteen MORTIEREN met STAMPERS uit den omtrek van Deurne afkomstig en tot de reeds meermalen genoemde nalatenschap van wijlen den heer S. H. VAN DER NOORDAA behorende; [...]

59940

31 maart 1864 [19] Romeinsche voorwerpen uit de nalatenschap van wijlen den heer S. H. VAN DER NOORDAA werden ook eenige overgenomen, van de vroegere bewoners van ons Vaderland afkomstig:

[20] eene zeer fraai gepolijste vuursteen BIJL, 12 dm. lang;

[21] een ruw bewerkte BAL van trachiet, 4 dm. in doorsnede;

59945

[22] eene URNE van gebakken aarde, gevuld met verbrande menschenbeenderen, hoog 19 dm.;

[23] eene andere URNE, 18 dm. hoog, met de daarin gevonden brokken van eene bronzen HAARNAALD;

[24, 25, 26] nog een drietal URNEN met verbrande beenderen en

59950

[27] overblijfsels van bronzen RINGEN enz.; de urnen van 10, 15.5 en 16 duim hoogte;

[28] twee KOMMETJES, 9 en 7 dm.;

[29] 4 POTJES van verschillende vormen, 6 5 tot 9.5 dm. hoog;

[30] een bekervormig VAATJE, 5.5 dm. hoog, en eenige brokstukken van potten.

59955

[31] Al deze voorwerpen, met uitzondering welligt van de WIGGE, waren in 1837 op de oude begraafplaats te Deurne in Noordbrabant opgegraven;

[32] een paar trachietsteen MORTIEREN met STAMPERS uit den omtrek van Deurne afkomstig en tot de reeds meermalen genoemde nalatenschap van wijlen den heer S. H. VAN DER NOORDAA behorende;

[33] zij vormen nu met de stukken die, ter zelfder plaats gevonden, in 1840 en 1841 door wijlen den heer P. O. G. GUYOT aan het Museum geschonken werden, een aanzienlijk geheel.

59960

28 november 1874 **OUDHEDEN.**

De belangrijke verzamelingen van oudheden, kunstvoorwerpen, boeken en archieven, nagelaten door den Heer G. Ch. H. GUILLON, in leven Notaris te Roermond, zullende ten verzoeken van den heer Mr. C. Guillon, Procureur aldaar, ten overstaan van den te Roermond residerenden Notaris MAX. CORNELIS, ten sterfhuize, op de volgende dagen, iedere reis te beginnen des voormiddags ten 9 ure, openbaar verkocht worden, te weten:

De Gothische kasten en andere voorwerpen van Kunst op maandag den 30 November eerstkomende.

De schilderijen en gravuren op den 1sten en 2den December daaraanvolgende.

De Archieven op den 9 december en volgende dagen.

De prehistorische, Romeinsche, Germaansche en Frankische oudheden op den 11 Jan. 1875 en volgende dagen

De intaglio's (intailles), Romeinsche munten en medailles, benevens de Middeleeuwsche munten en andere penningen, op den 18 Januarij 1875 en volgende dagen.

Alle verzamelingen, met uitzondering der bibliotheek, zullen tegen contante betaling en tien percent verhooging voor kosten, verkocht worden.

Voor de voldoening der boeken wordt drie maanden crediet verleend.

Aan heeren liefhebbers zal daags voor de respectieve verkooppingen, van des voormiddags 9 tot des namiddags 5 ure, de gelegenheid gegeven worden om de te verkoopen verzameling te bezichtigen.

De vereenigde Catalogussen zijn tegen betaling van 60 cents verkrijgbaar bij den uitgever dezer Courant, terwijl daarenboven voor aanvragen buiten Roermond het porto der post bedraagt als volgt: voor Nederland en België 22, voor Duitschland 55 en voor Frankrijk 56 cents.

Ter voldoening van koopprijs en porto worden postzegels aangenomen.

24 februari 2014 Antwoord van Heikki Pauts van het Rijksmuseum te Leiden

- april 1884, inventarisnummers ND 16-37 "Afkomstig uit de verzameling van wijlen de hr. S.H. van der Noordaa, opgegraven te Deurne. Aangekocht op een verkoping te Amsterdam bij Frederik Muller en Co op 8 April en volgende dagen 1884 "in de brakke gronden".

[g=ND&Afdeling=&Objectnaam=&Materiaal=&Periode=&Vindplaats=](http://www.rmo.nl/collectie/zoeken?g=ND&Afdeling=&Objectnaam=&Materiaal=&Periode=&Vindplaats=)

1 maart 1890 **Antiquiteiten.**

Het beroemde MUSÉE GUILLON gedurende meer dan een halve eeuw bijeenverzameld door den bekenden oudheidkundige CHARLES GUILLON, Notaris te Roermond, zal publiek worden VERKOCHT op Dinsdag 11-15 Maart a.s. te AMSTERDAM door G. THEOD. BOM & ZOON, Spuistraat 135.

De verzameling omvat meest in Limburg opgegravene Romeinsche, Germaansche, Celtische en Middeleeuwsche Oudheden, Romeinsche en Geldersche Munten en Medailles, Limburgsche Muntstempels, Japansch gelakte en oude eikenhouten Meubelen, Porceleinen, Schilderijen, Kostbaarheden, enz.

Catalogus f 0 25.

8 maart 1890 **De catalogus der kunstvoorwerpen,**

nagelaten door wijlen den notaris Guillon alhier, noemt wel duizend in Limburg opgegravene Romeinsche, Germaansche, Keltische, Frankische en middeleeuwsche oudheden, uit het steen- en uit het bronstijdperk, lijkurnen, Romeinsch glas- en aardewerk, ruim 70 stuks van het fraaie roode aardewerk van Samos, een eenige in zilver gedrevene schildplaat, waarschijnlijk uit de laatsten tijd van het Romeinsche keizerrijk, ruim 80 gesneden steenen of cameeën, 1400 antike gouden, zilveren en bronzen munten, eenige middeleeuwsche Geldersche en Limburgsche munten, muntstempels en zegels, benevens eene kleine verzameling zilveren drijfwerken, oude meubelen, enz. De met zorg bewerkte catalogus bewijst wel, dat hier voor onze antiquaren en oudheidkundigen veel belangrijks te vinden is.

10 maart 1890 **Twee zeer belangrijke veilingen**

zullen dezer dagen weder bij de auctionarissen G. Theod. Bom & Zoon, te Amsterdam, plaats hebben.

De eerste, bevattende de verzameling oudheden en munten, nagelaten door wijlen den Heer Charles Guillon, notaris te Roermond, is voor de beoefenaars der geschiedenis van ons vaderland vooral van groot belang. Nimmer toch werd eene dergelijke collectie van 1000 in Limburg opgegraven Romeinsche, Germaansche, Keltische, Frankische en middeleeuwsche oudheden in veiling gebracht. Zij doet ons een blik werpen in de zeden

- en gebruiken van die tijden. Zoowel het steen- als het bronstijdperk zijn ruim vertegenwoordigd, terwijl de verzameling Germaansch aardewerk, waaronder vele urnen met de asch onzer Germaansche voorvaderen, tot de rijkste mag worden gerekend. Ook het Romeinsche glas- en aardewerk, urnen, enz., waaronder van het fraaie roode aardewerk van Samos, verdient belangstelling, evenzeer als de in zilver en haut-relief gedreven umbo of schildplaat, een meesterstuk van drijfwerk uit den tijd van het Bas Empire. Voorts behoort tot deze collectie nog eene verzameling van ruim 80 meest antieke gesneden steenen of cameeën, antieke gouden, zilveren en bronzen munten, eenige middeleeuwsche Geldersche en Limburgsche munten, enz., enz. De tweede, van beperkter omvang, bevat een collectie antiquiteiten, zilveren drijfwerken, antieke meubelen, historische en Amsterdamsche rariteiten, kostbaarheden, porselein en Delftsch aardewerk, horens en schelpen, schilderijen, stereoscopen, glazen stereoscoopplaten, enz.
- Een en ander is te bezichtigen in het verkooplokaal der firma, Spuistraat 135, Zaterdag, Zondag en Maandag 8-10 Maart, van 10-3 uur.

Eindhoven, 27 februari 2014
Geachte mijnheer Louer,
Als bijlage vindt u een bestand over vondsten in de Peel. Ik ben zeer geïnteresseerd in voorwerpen die tot nu toe nog niet beschreven zijn. Verder verwijs ik naar www.theelen.info.
met vriendelijke groeten,
Paul Theelen
- Geachte mijnheer Scheijvens,
Naar aanleiding van ons telefoongesprek stuur ik als bijlage gegevens van voorwerpen

- 60095 die in de Peel, vooral bij het turfsteken, zijn gevonden. Voor het overige verwijs ik naar de uitgebreide website www.theelen.info, daarvan stuur ik ook de inhoudsopgave mee, zodat u er met trefwoorden in kunt zoeken en van daaruit naar het betrokken bestand kunt springen.
met vriendelijke groeten,
Paul Theelen
- 60100 27 februari 2014 van Ronald Louer (rlouer@brabant.nl)
Geachte heer Theelen, Beste Paul,
Hierbij een inventarislijst van vondsten uit de Peel (Helmond, Laarbeek, Gemert-Bakel, Deurne, Asten, Someren en Geldrop – zonder de plaatsnaam Mierlo) die
60105 geïnventariseerd zijn in het Provinciaal Depot Bodemvondsten Noord-Brabant. Nog niet de gehele collectie is geïnventariseerd, dus er kunnen nog meer vondsten in ons depot aanwezig zijn uit die gemeenten. De Provincie Noord-Brabant is pas vanaf het jaar 2000 verantwoordelijk voor het Provinciaal Depot Bodemvondsten Noord-Brabant. Daarvoor viel dit depot onder de verantwoordelijkheid van het Rijk. Sinds 2000 zijn
60110 wij bezig om de gehele collectie na te lopen en te inventariseren. De vondsten die gedaan zijn voor 1960 vallen in het algemeen onder het Noordbrabants Museum (als voortzetting van het Provinciaal Genootschap Noord-Brabant) of zijn in andere collecties terecht gekomen, maar een aantal van deze oudere vondsten bleken toch in ons depot aanwezig.
60115 Indien u nog verdere vragen heeft, ben ik graag bereid deze naar vermogen te beantwoorden.
Met vriendelijke groet,
Ronald Louer | Beheerder Provinciaal Depot Bodemvondsten Noord-Brabant | 06-18303225
- 60120 10 maart 2014 aan avanpinxteren@hnbm.nl
Eindhoven, 10 maart 2014
Geachte mijnheer van Pinxteren,
Ik ben bezig met het inventariseren van vondsten die in het veen van de Peel zijn terecht gekomen. Vondsten uit de veengebieden in het noorden van het land worden
60125 daarbij betrokken omdat daar wat meer is gevonden dan in de Peel. In het bijzonder richt ik het verzoek aan u betreffende de begraafplaats ten zuiden van Deurne die in 1837 is gevonden. Hoewel dit strikt gesproken niet tot de venen behoort. In uw museum zijn voorwerpen terecht gekomen, zoals urnen met inhoud; enkele vijzels (waarschijnlijk uit de Middeleeuwen) zijn via het museum van Leiden rond of na 1875
60130 ook bij u terecht gekomen of ze zijn verdwenen...
Kunt u aan de hand van de bijgestuurde bestanden op zoek gaan naar genoemde urnen en metalen voorwerpen, al dan niet door het museum aangekocht of anderszins verworven? bij voorbaat dank,
Paul Theelen zie ook www.theelen.info

Reports on the discovered Germanic cemetery in Deurne

- 60140 February 24, 2014. At the end of January 1837, a complete burial plot was discovered on the heathland near Deurne. Urns were immediately given away as gifts, so there is little clarity about the objects and their current "whereabouts." This also applies, to a lesser extent, to the few other objects found in the peat bogs/marshes in the municipality of Deurne and elsewhere in the Peel region, and nationally in the peatlands of the north of the country.
- 60145 In this file, I will limit myself to the cemetery. Information about the other areas can be found in other files at www.theelen.info.
At my request, Mr. H. Pauts of the National Museum of Antiquities in Leiden provided further information about objects that have been in his museum since ancient times. However, some, at least the mortars and pestles, have been donated to a prospective
60150 museum. From that moment on, we lost track...
H. Pauts's comments have been incorporated into my own research.
- Collected details regarding the cemetery near Deurne
- 60155 [1] Several urns or pots of various sizes, all filled with the ashes of cremated bodies and small bones
[2] while in some, pieces of metal and parts of weapons were found
[3] Kempen heath
[4] First 5, then 50 urns were found
[5] Not a single penny or coin was unearthed; only a piece of metal, which is

- 60160 believed to be the mouthpiece of a wind instrument.
[6] Excavations are still continuing in some places, but as mentioned, nothing but ashes and the aforementioned human bones are found in the urns.
[7] Urns or pots of various sizes, all filled with the ashes of cremated bodies and small bones;
- 60165 [8] We received a number of urns that had recently been discovered in Deurne, North Brabant; and the number was further increased by the proceeds of a deliberate excavation ordered for this purpose, donated to the Museum by the mayor of that town, Mr. van Riet.
[9] Several Roman objects from the estate of the late Mr. S. H. VAN DER NOORDAA were also acquired, originating from former inhabitants of our country:
- 60170 [10] The urns appear not to date from the Roman period, but from many hundreds of years earlier.
[11] Two tuff mortars with pestles, excavated near Deurne in North Brabant, were sent to Mr. S. H. van der Noordaa of Dordrecht;
- 60175 [12] These objects (mortars) were NOT found in the data of the more than 40,000 objects online. The mortars most likely date from the Middle Ages and were donated by the museum in Leiden around 1875 to another museum yet to be established.
[13] From Mr. P. O. P. Guyot, of Nijmegen, a very important collection of bronze and other objects excavated near Deurne, in the province of North Brabant, most of which
- 60180 were assembled by Captain Baron van Voorst and donated to Mr. Guyot.
[14] The Museum now possesses the most important and rarest pieces that came to light during the discovery in Deurne, and which, through various means, finally reassembled, form a whole that [...]
[15] From Mr. P. C. G. GUYOT, of Nijmegen, a number of ten urns, pots, and bowls, found in Deurne in North Brabant; [16] From Mr. S. H. van der Noordaa in Dordrecht, three more small objects in urns were found in Deurne.
- [17] From Mr. S. H. VAN DER NOORDAA, we again received a tuff mortar, found in the vicinity of Deurne.
- 60190 [18] Nos. 1-3 from Deurne.
[19] Several Roman objects from the estate of the late Mr. S. H. VAN DER NOORDAA were also acquired, originating from former inhabitants of our country:
[20] a very beautifully polished flint axe, 12 dm long;
[21] a roughly worked trachyte ball, 4 dm in diameter;
- 60195 [22] a baked earthenware urn filled with burnt human bones, 19 dm high;
[23] Another URN, 18 dm. high, containing the fragments of a bronze HAIR NEEDLE found inside;
[24, 25, 26] Three more URNS containing burnt bones and
[27] remains of bronze RINGS, etc.; the urns were 10, 15.5, and 16 inches high; [28]
- 60200 Two CUBS, 9 and 7 dm.;
[29] Four POTS of various shapes, 6.5 to 9.5 dm. high;
[30] A beaker-shaped VESSEL, 5.5 dm. high, and some fragments of pots.
[31] All these objects, with the possible exception of the WIGGE, were excavated in 1837 at the old cemetery in Deurne, North Brabant;
- 60205 [32] a pair of trachyte stone MORTARS with PESTLES from the vicinity of Deurne and belonging to the estate of the late Mr. S. H. VAN DER NOORDAA, already mentioned several times;
[33] they now form part of the pieces found at the same location in 1840 and 1841 by the late Mr. P. O. G. GUYOT
- 60210 A considerable collection was donated to the Museum.
[34] A person named van der Noordaa, living in Dinther, was a school inspector in a district of the province around 1820.
- February 24, 2014 Response from Heikki Pauts of the Rijksmuseum in Leiden
- 60215 Below, I am sending you a complete list of finds from Deurne that the RMO received in the 19th century. You can also find some of these objects on our website - only those with a photograph are published there. The rest of the information comes from our inventory books. Between 1818 and 1891, the RMO used a somewhat confusing combination of the initials of personal names and locations for its inventory numbers, so, for example, "vRD" contains "van Riet Deurne." From 1891 onwards, the RMO switched to a new system of inventory numbers, consisting of a province code (k = North Brabant), year, month, and serial number. So, for example, k 1932/12.9 arrived at the museum in December 1932.
- 60220
- 60225 February 4, 1837 Deurne, February 3, 1837.

To the Editors of the Noord-Brabander. For eight days now, the municipality of Deurne has provided proof that this region also contains treasures, in terms of antiquity and history, that can easily be compared to other parts of our country. The attention of our Dutch scholars is therefore drawn to the following: this may enable them not only to expand their collections of antiquities with important articles, but also to render important contributions to history.

Begun by the official corps of Regt. Huss. No. 6 and continued by private individuals in the hope of finding treasures, they are busy here excavating a camp or army, or even a cemetery; Probably originating from a tribe driven from the Ardennes by the Romans, and hidden here, behind the marshlands of the Peel. Several urns or pots of various sizes, all filled with the ashes of burned bodies and small bones, have already been excavated; while in some, fragments of metal and parts of weapons have been found. These pots are covered by mounds of varying heights, which, like the pots themselves, have certainly increased in size and height, reflecting the prestige and rank of the person buried there. The pot is almost like a globe, tapering slightly oval towards the top and bottom, while at the top it has a slanting rim, which will have approximately the same circumference as the pot itself. The lid, which is very small in proportion to the pot, fits well and appears to be tightly covered. The largest pots will have a diameter of 3 palms, while the smallest will barely reach 1 to 1.5, and the mounds will also vary by almost a yard, as some are nearly 2 feet high, while others are more than five feet high. The pots are made of potting clay (which is also found here) and demonstrate that they had already advanced the art of turning to a considerable extent.

P.
[elsewhere:] - The attention of our national scholars and antiquarians is called to this discovery, which may be useful for adding to their collections or for elucidating history.

February 4, 1837 [1] Several urns or pots of various sizes, all filled with the ashes of burned bodies and small bones,
[2] while in some, pieces of metal and fragments of weapons have been found.

May 4, 1837 NETHERLANDS. In the latest issue of the Dutch Magazine, one finds an article about the recently unearthed urns in North Brabant. It mainly concerns the recent publication of reports in several of our daily newspapers regarding the excavation of antiquities in the municipality of Deurne, province of North Brabant. The editors of the aforementioned magazine have now received some details regarding this excavation, primarily as follows: A captain in the Hussar Regiment No. 6, having previously discovered that some mounds on the Kempen heath, during excavations, turned out to be burial mounds and contained urns or ash jars, came up with the idea that some similar mounds, which were present on the heath near Deurne, his current cantonment, might have served similar purposes and contained antiquities. With the permission of the mayor, having had excavations carried out, five urns or ash jars were found, which increased with subsequent excavations and now number more than fifty. It is unfortunate that the farmers, hearing of this, also began digging on their own side, hoping to find treasures; they smashed or damaged the urns they unearthed. Their disappointment was great when they found nothing but ashes in them. A few half-decayed human bones, such as skulls, ribs, thighbones, etc., were found. Not a single penny or coin was unearthed; only a small piece of metal, which is believed to be the mouthpiece of a wind instrument. The urns found are of varying sizes, but all of roughly the same shape, and some have lids. The heathland in which the urns were found is about four acres in size; the mounds are fairly regular, but the entire area appears to have served as a burial ground, as urns have also been found outside the mounds and at some distance from them. The urns are usually covered with a layer of charcoal; after all, as soon as one finds this, one is certain to be near an urn. Some are so high that the fibrous roots of common heather can be found above the ashes; others have been found deeper, but at uneven depths. The material from which these pots or urns are composed is smooth, solid, and dark brown in color; no glaze is visible on them, nor any inscription or inscription. If they were made in Deurne, where two potteries are still found, then one must admit that this art has not progressed there in 10 or 15 centuries; because these urns are worked more precisely and smoothly and treated with more care than is currently the case. Excavations are still continuing in some places, but, as mentioned, nothing is found in the urns other than ash and the aforementioned human bones.

June 3, 1837 HAARLEM, February 30

60305

A report has been received from the municipality of Deurne (North Brabant) regarding the discovery of a camp or cemetery near that location; It is believed to originate from an ancient tribe, driven from the Ardennes by the Romans, who sought refuge there, behind the marshlands of the Peel. The first discovery of this military or burial ground was made by officers of the Hussar Regiment No. 6, stationed in the area, and since then, excavations have continued by private individuals in the hope of finding treasure. Among the finds thus far are several urns or pots of various sizes, all filled with the ashes of cremated bodies and small bones; in some of these pots, it is reported, pieces of metal and fragments of weapons have been found. The aforementioned pots are covered by mounds of varying height, which, like the pots themselves, have likely increased in size and height according to the appearance and rank of the person buried there. The pots are made of clay and are well-turned; the largest have a diameter of 3, the smallest just over 1 palm. Some mounds are almost 2 feet high, others more than 5 feet.

- August 1837, inventory numbers vRD 1-9b "Found near Deurne and given to the RMO as a gift by Mr. van Riet, mayor of Deurne and Liessel in August 1837"; http://www.rmo.nl/collectie/zoeken?q=vRD*&Afdeling=&Objectnaam=&Materiaal=&Periode=&Vindplaats=

60325

May 26, 1838 (\$\$) The Roman graves, even the simplest ones,

b. Those that did not contain stone coffins yielded not only pottery, immediately identifiable as Roman by its workmanship, shape, color, or decoration, but also objects or fragments of metal, glass, or other composite material. On the contrary, no flint objects were ever found there. I have noted the distinct character of Roman and Germanic mound graves, among other places, in a report on the Antiquity discovery in Deurne, published in the Konst- en Letterbode of May 26, 1838.

60335

On April 23, 1839 [8], a number of urns were sent to us, which had recently been discovered in Deurne, in North Brabant; and the number was further increased by the proceeds of a specially ordered excavation, donated to the Museum by the mayor of that town, Mr. van Riet. [probably NBD 2, vRD 4a, vRD 2, vRD 3, ND 3, GtD 15]

60340

a, k 1942/6.1, k 1925/1.1, NBD 1, k 1942/6.2, vRD 7, k 1925/1.2, ND 2, k 1942/6.3, ND 13, vRD 4b, vRD 5a, ND 4, GtD 13a, ND 8, k 1932/12.9, ND 10, ND 5, vRD 8, vRD 5b, ND 11, k 1942/6.4, GtD 14b]

[10] The urns appear not to date from the Roman period, but from many hundreds of years earlier. March 18, 1840 [11] From Mr. S. H. van der Noordaa, in Dordrecht, two tuff mortars with pestles, excavated in the vicinity of Deurne in North Brabant; [12] These objects were NOT found in the data of the more than 40,000 objects online.

60345

January 1, 1840 If you, gentlemen, who do not forget the noble pleasure of hunting during your recreations, are inclined, or feel inspired, to bring to light such remnants of the distant past, then nothing more is necessary than to pay attention to whether your eye finds any mounds on the flat heath, approximately one and a half yards high, and two to two and a half or three feet in diameter. If you come across such mounds, it is almost certain that urns are hidden there. The cemetery in Deurne and the one in Baarle-Nassau, at least, were discovered by hunters while hunting, who also claim to have encountered similar tumuli in the past, though without noticing them, on the North Brabant heathland.

60355

March 14, 1840 MUSEUM OF ANTIQUITIES IN LEIJDEN.

[...] From Mr. S. H. van der Noordaa, of Dordrecht, two tuff mortars with pestles, excavated in the vicinity of Deurne in North Brabant; these are the only objects of this kind in the Museum's possession, and which, as far as we know, have not yet been found elsewhere. The proximity of the extensive burial grounds there, discovered in the heath a few years ago, lends considerable credibility to the suspicion that both the mortars and the urns found in such large numbers in that area belong to the same tribe, thus providing a crucial contribution to the knowledge of the domestic life of the ancient Germanic peoples, of whose household goods, except in northern Europe, relatively little remains. [...]

May 12, 1840 [letter to the mayor of Deurne]

Mayor of Deurne Liessel Helmond, May 12, 1840

The Lord Governor of this province (probably commissioned by the board of the Society for the Promotion of Science and the Arts in North Brabant) has given me a large number of questions to answer regarding antiquities in my District. These questions, insofar as they concern the municipality of Deurne-Liessel, are as follows:

According to a reported report, a farmer named Mortel allegedly possesses a Roman sword and a gold shield, which were allegedly excavated in the Peel.

1. Is this actually the case? And if so, when and where were the sword and shield found?

2. Would it be possible to purchase them for the collection of antiques and rarities of the provincial society of arts and water boards?

3. If so, at what price?

4. If the owner is unable to decide to sell, would they be willing to hand over the objects for appraisal and signature, against proof?

5. Is it possible to purchase some of the recently discovered mortuary urns or other curiosities excavated there?

6. What is the name of the place where these urns were excavated?

A somewhat prompt answer to these questions would be appreciated.

D. Distr.

June 29, 1840 Provincial Board RANB 17 inv. no. 12419
no. 1

Missive of April 17, 1840, no. 8. / Response to the letter from
the Department of Arts and Sciences / April 17, 1840, no. 8.
Helmond, June 29, 1840.

[To the Governor]

In the aforementioned letter, UWEG provided me with some questions regarding ancient monuments that are said to be located in some municipalities of my district. I could have answered some of these questions immediately, but I took advantage of my travels to gather information, as I believed I could be better informed when the council members were in session. I will observe the order as it appears in your letter.
[...]

Municipality of Deurne-Liessel.

I have very much doubted the report that a farmer in Deurne-Liessel was in possession of an old Roman sword and a gold shield, which were supposedly dug up in the Peel, as I had never heard anything about it. Research has also revealed that no one knows anything about it. This was probably confused with what happened in the neighboring municipality of Meyel. In 1807, a gold shield was found there. A few years ago, while I was in Meyel, I went to the house of the then mayor, Goossens, to see this remarkable sight. He showed me a shield that had been found in the Peel in 1807 five feet below the surface of the ground in the Peel, found during a peat excavation, it was made of gold or at least heavily gilded, hammered work. Hydroglyphs and other figures of lions, tigers, etc., were engraved on it, and had the shape of a crescent, closely resembling a gorget such as infantry captains wore on their chests not so long ago. The Lord of Keverberg, then deputy prefect in Cleef, had taken this piece with him to Paris and, according to the Mayor, offered a high price for it after his return, but they could not agree on the price. -

There are no longer any mortuary urns available in Deurne. The Lord Mayor would attempt to acquire more by excavation, which he would gladly relinquish if successful. -

The District Commissioner / DD.

Height: 0.16 ell.

60495

C.74. Pot of brown earth, shape as in Fig. 29, but without handles; contents: ash-like earth; Origin: Deurne, from a Germanic burial mound; gift from the Lord of Riet. This jar was found in jar no. 81.
Height: 0.095 ells.

60500

74a. Jar of dark brown earth; shape, much like Fig. 32, but damaged at the rim; contents: burnt bones; origin: Deurne, from a Germanic burial mound; gift from the Lord of Riet.
Inside it was jar no. 164.
Height: 0.25 ells.

60505

81. Small jar of dark brown earth, fairly finely worked and probably shaped like Fig. 32, but the rim is broken off; contents: burnt bones; origin: Deurne, from a Germanic burial mound; gift from the Lord of Riet.
Inside it was jar no. 74.

60510

Height: 0.195 ells.

82. Pot of dark brown earth; shape as in Fig. 32; contents, burnt

60515

Bones and ashes; origin, Deurne, from a Germanic burial mound; gift of the Lord of Riet.
Height: 0.24 cubits.

91. Pot of brown earth; shape similar to Fig. 28, but damaged on top; origin, Deurne, from a Germanic burial mound; gift of the Lord of Riet.

60520

Height: 0.16 cubits.

93. Pot of light brown earth; shape similar to Fig. 37, but with a handle; contents: burnt bones and ashes, above which lay some fragments of rough pottery, which may originally have belonged to a dish of 18 inches in diameter; origin, Deurne; from a Germanic burial mound.

60525

Height: 0.21 cubits.

98. Pot of dark brown earth; shape similar to Fig. 41, but severely damaged on one side; Contents: burnt bones; origin, Deurne, from a Germanic burial mound; gift from Mr. van Riet.

60530

Height: 0.245 ells.

C. 99. Pot of dark brown earth; shape approximately like Fig. 41; contents: burnt bones; origin, Deurne, from a Germanic burial mound.

60535

Height: 0.205 ells.

101. Pot of brown earth; shape approximately like Fig. 34; contents: burnt bones; origin, Deurne, from a Germanic burial mound; gift from the Lord of Riet.
Height: 0.15 ells.

60540

C. 109. Pot of dark brown earth; probable shape as Fig. 34, but half damaged at the top; contents: burnt bones; origin, Deurne, from a Germanic burial mound; gift from the Lord of Riet. Height 0.27 cubits.

60545

119. Brown earthenware pot; probable shape similar to Fig. 42, but the rim and handles are broken away; decoration: 5 roughly scratched lines above the body; contents: burnt bones; origin: Deurne, from a Germanic burial mound, gift of the Lord of Riet.
Height 0.16 cubits.

60550

C. 164. Small grey earthenware pot, fairly fine material and rough workmanship; shape similar to Fig. 67, but damaged on one side; origin: Deurne, from a Germanic burial mound found in pot no. 74*; gift of the Lord of Riet.
Height 0.04 cubits.

60555

195A and 195 B. Tuff mortar and pestle; shape similar to Fig. 20a and 20b; origin: Deurne; Gift of Mr. S. H. van der Noordaa.
The mortar is 0.075 cubits high; 0.11 cubits wide.
The pestle is 0.1555 cubits long.

196A and 196B. Mortar and pestle of tuff; shape as in Fig. 20 a and b; decoration on the sides as in a, c, and d; origin Deurne; gift of Mr. S. H. van der Noordaa.
The mortar is 0.07 cubits high, 0.13 cubits wide.
The pestle is 0.10 cubits long.

209*. Leaf-shaped tool of cast copper, decorated with verdigris, provided with a split point and three elaborate holes, and sharp on the sides, see Fig. 16; possibly a tool for working pots; origin Deurne, from a Germanic burial mound; gift of Mr. P. Guyot. Original diameter of the whole: 0.045 el.

209a. Two copper fragments, covered with verdigris, but deformed by burning; these appear to have been the mouthpiece of a trumpet; origin: Deurne, from a Germanic burial mound; gift of Mr. P. Guyot.
Original diameter of the whole: 0.045 el.

February 24, 2014 Response from Heikki Pauts of the Rijksmuseum in Leiden
2014: We were already in contact about those mortars and pestles last summer.

As I wrote then, the objects in question were transferred to Amsterdam in the 19th century (VdN a-f to the Museum of the Royal Antiquarian Society in 1860, VdN g-k to the then National Advisor for Monuments of Dutch History and Art in 1875). I'm not sure, but I think those collections later ended up in the Rijksmuseum Amsterdam. Below is a summary of the information about the relevant mortars and pestles from our inventory books:

- February 1839, inventory numbers VdN a-b "Found in North Brabant, donated to the Museum of Antiquities by Mr. S.H. van der Noordaa in Dordrecht.

a) Mortar with pestle, made of gray tuff; probably for grinding grain; (perhaps also for the preparation of mustard due to its smaller size). The mortar is square on the outside but slightly rounded at the corners; hollowed out spherically on the inside.

b) The pestle is square on top, but tapers conically at the bottom, somewhat resembling an inverted cippus with a base.

Regarding these two objects, Mr. van der Noordaa writes the following in his letter dated Dordrecht, December 17, 1838, to Dr. L.J.F. Janssen: Report:

"However, a small basalt mortar and pestle were also sent to me, roughly similar in shape to the one I possess, with the only difference being that the first mortar and pestle I received seem to belong together, while the pestle sent to you is somewhat too large for the mortar intended for it. Both mortars and both pestles are made of basalt, the kind found along the Rhine. These objects were shaped with minimal effort to match the natural grain of the stone. These antiquities were not found at the cemetery in Deurne in question; but now...

A few years ago, I found them in the countryside and in a garden there. The last mortar and pestle sent even came from various places near Deurne and from different people. There have been more similar, rough household items in that area, larger and smaller, found earlier and later, but they have been scattered again. One of my brothers, formerly with the Lanciers, now out of work due to poor health and wounded in Deurne, tracked down the mortars in question for me. He crisscrossed the Majorij in all directions; he is known everywhere there. I myself would find my way to many places at night, and yet, after all the searches, it is impossible to discover similar mortars anywhere else in North Brabant, other than precisely in the vicinity of Deurne, where they have certainly been found and known, because, as I said, they have had more of them there. Thinking about this phenomenon, it occurred to me that these tools could have originated from the same tribe that bequeathed its deceased to the discovered cemetery.

- November 1839, inventory numbers VdN c-d "Found in the vicinity of Deurne and donated to the Museum by S.H. van der Noordaa, Deputy Clerk in Dordrecht.

c) A mortar made of tuff stone, square in shape and decorated on the outside, such as a small column at each corner, while the four fields between these columns are divided into diamonds and triangles. Of these four fields, two (which face each other) are carved thus: [drawing] the third has upright, and the fourth offset

diamonds, as: [drawing] internally it has been hollowed out round.

d) Pestle of the same type of stone, square at the top and round at the bottom. This one is too small to have originally belonged to the aforementioned mortar.

60625 It is remarkable that this and similar mortars have been found in such large numbers in the vicinity of Deurne, Lijsel, and Asten, as Mr. van der Noordaa verbally assured me (Dr. Janssen), and indeed within an hour's radius, while, according to his assurance, they have not yet been found elsewhere in North Brabant.

60630 - October 1842, inventory numbers VdN e-f "Found in the vicinity of Deurne and donated to the Museum by S.H. van der Noordaa in Dordrecht.

e) A tuff mortar, oblong-square in shape and rather roughly worked.

f) Two pieces of iron ore, apparently found in an urn. - June 1863, inventory numbers VdN g-k "Found in the vicinity of Deurne, originating from the collection of the late Mr. S.H. van der Noordaa, and of his son, Mr. van der Noordaa of Dordrecht, acquired for the Museum of Antiquities.

60635 g) Mortar of trachyte stone, round on the inside, octagonal on the outside, and decorated with Gothic niches, in relief; the date 1393 is chiseled into two of these niches, and the letters A and H are scratched into two others, probably by a later hand. The shape is p.m. [drawing]

60640 h) Pestle of trachyte stone, belonging to the mortar VdN g, shape p.m. [drawing]

i) Mortar as VdN g, but square in shape, with four pilasters on the outside, as VdN h.

k) Pestle, as VdN h, and belonging to the mortar VdN i.

60645 December 31, 1865. As a supplement, we find some details not mentioned elsewhere in the book Noord-Brabants Oudheden (facsimile from 2012):

With about thirty enthusiasts from his company, he went to the heath at Deurne and soon became convinced that these elevations were burial mounds. These are of varying height, with some being only 60 inches high, and others 7.60 ells high, with a larger or smaller circumference depending on the height. Approximately one hundred urns were found, ranging from the size of a teacup to 100 pound in weight. [...]

60650 In the spring of 1840, I visited this heath with the late Dr. Niermeijer, later a professor in Leiden, and found the mounds just as they were when this treasure hunting stopped! [...]

60655 Thirteen urns and small jars are on display in the Rijksmuseum in Leiden. At the home of Mr. H. de Grez in 's-Hertogenbosch, four urns and small jars (1), and two urns and a small jar are preserved in the cabinet of the North Brabant Society.

60660 (1) While printing this report, Mr. de Grez obliged me to present these well-preserved urns to our cabinet as a gift.

January 1, 1841 TREATMENT on the Germanic Cemeteries discovered in North Brabant.

[262] "The burial mound and the curiosities found therein may seem insignificant at first glance, but this prejudice will soon be discarded when one discovers, to one's surprise, that such an insignificant coincidence offers so much material for understanding the writings of the ancients and sheds such light on the oldest history and folk customs."

Westendorp.

60670 North Brabant is rich in remains of the time before, and it still contains much in its folk concepts, customs, and folk traditions, which is invaluable to the antiquarian and can lead him to a more thorough understanding of the people whom the warring Romans first encountered and roughly depicted.

60675 In the previous installments of the Miscellany, we have already shared some reports on this subject, and the approval they have received from many readers [263] encourages me to share our other research from time to time:

1. concerning the gods and their temples,

2. "the sacred groves,"

3. "the sacred trees,"

60680 4. "the sacred springs,"

5. "the pagan burial sites."

We now select for consideration the pagan burial sites that have been discovered:

1. at Orten near 's-Hertogenbosch,

2. Alphen in the barony of Breda,

60685 3rd. Mun near Oss,

4th. Deurne near Helmond,

5th. Gemonde near St. Michielsgestel,

6th. Genderen (land of Heusden),
 7th. Engelen
 60690 8th. Tilburg,
 9th. Haren near Megen.

We will accompany these statements with those details that our ancestors primarily knew at the solemn time of their passing, and which were gathered either from medieval documents, from the language, or from the mouths of the people. We hope that
 60695 the reader will readily appreciate the length of this treatise, due to the variety and novelty of many of our observations.

[273] CEMETERY IN DEURNE.

The cemetery from the heathen past, which was discovered in 1837 in the heathland 20 minutes from Deurne, and from which some 100 urns were dug, has caused quite a stir. In the spring of 1840, I went there to inspect this cemetery with my own eyes, and after conducting research, I found that the reports by Dr. Jansen in the Konst- en Letterbode (a) placed, are most accurate, which is why we will reproduce the factual report in the words of this antiquarian.

60700 Mr. F. Baron van Voorst tot Voorst, captain in the Hussars N. 6. regiment stationed in Someren, found while hunting in the vicinity of various villages, including Deurne, in the highest points of the heath, [274] regular elevations, which he assumed must have had a purpose in earlier times. "I thought," writes his well-born Highness, whose words we will follow, "I thought, after the hunting season I want to
 60710 know what's in there; I spoke about it with the Mayor, who willingly granted permission for the excavation. With about thirty enthusiasts from the company, which I am with, we set to work and, in a few hours, found four urns of various shapes and sizes, three of which were cracked and fell apart when lifted. All the wares, as well as those found more closely, were half-filled with burnt human bones. The addition is
 60715 a compact black earth, perhaps formerly ash and charcoal... If charcoal were discovered while digging, the urn wouldn't be far away.

"Human bones without urns were rarely found. Of the human bones, fragments of skulls, ribs, and especially the rounded heads of the femurs and humers are still clearly distinguishable... I consider them hand-made, at least not as they are now turned and poorly fired, which can be seen on the edges when the shards are broken. The color of some is chocolate-like, of others grayish. Two were light red, and one seemed roughly glazed. The day after I started, several farmers and burghers had also begun searching for a treasure pointed out by the Captain of the Cavalry, and soon two
 60725 hundred farmers were busy turning everything upside down without order or consultation. Good advice was of no use. Later, some understood this. The earth has a depth and a half of that solidity and brownness... which it possesses elsewhere. Digging deeper [275] one soon discovers that the ground has not been disturbed before (or not).

60730 "The urns, which are in yellow sand, are smoother, whiter, and brighter in color than those in soil that resembles topsoil. Those found in the flat ground are even less than a foot deep; in the mounds, 2.5 to 3 feet; one urn above the other; in larger ones, sometimes smaller ones, or hidden within them, like a woman in labor with her child. - I had examined the largest mounds (a), assuming that these were the graves
 60735 of the most prominent people. If this was nothing more than an ordinary cemetery of that time, then these could have been family graves, which one is inclined to believe when one sees the urns placed above each other with some space between them; through which these mounds successively reached that height, which must have lost much of its height over time due to rain, drought, and wind. - Burnt metal has been found on some
 60740 urns; very small (however) in comparison to the urns expanse of raised ground, which now resembles a desert... This cemetery is intersected by a footpath to Asten, located 20 minutes from Deurne; it is estimated at eye level to be 150 paces wide and 500 meters in area... Well over a hundred urns of various shapes and sizes were found, two-thirds of which were damaged, ranging from the size of a teacup to
 60745 weighing 100 pence. They are sold for 1 to 4 guilders... I should also add that not far from the cemetery there is a long, wide ditch, the purpose of which is unclear; it was used for transport (except as a supply of drinking water). could not have served as either an enclosure or a boundary divider."

To this point, Dr. Jansen shares the above-mentioned remarkable reports with the words of Baron van Voorst himself, taken from a letter dated Someren, March 25, 1837, who adds in praise of the honored discoverer: "From this important report, it becomes clear that Mr. van Voorst was the first to make the discovery. At the same time, one cannot deny him the praise for having proceeded more judiciously and accurately than

one might have expected from someone who did not make this type of exploration his special study; He will be grateful for his attention to details that cannot be overlooked in a scientific assessment."

When I was in Deurne, I was told that thirty years ago a shepherd had found an urn containing human bones, but that he had considered them the remains of a manslaughter and, to avoid contact with the police, had kept the matter quiet and buried the bones and potsherds back in the ground.

Let us now consider the objects discovered in this Germanic cemetery. They are of three kinds:

1. About a hundred urns.
2. Some metal ornaments.
3. Three suspicious objects.

[277] I. URNS.

The National Museum of Antiquities in Leiden preserves:

1. A cracked pot of dark brown earth, containing burnt bones. Height 0.16 ells. (being No. 66a of the collection of antiquities.)
2. Small pot of brown earth, with ash-like soil. Height 0.095 cubits (No. C. 74). This pot was found in a
3. Pot of dark brown earth, fairly finely worked, but damaged at the rim, with burnt bones. Height 0.195 cubits (No. 81).
4. Pot of dark brown earth, damaged at the rim, with burnt bones. Height 0.25 cubits (No. 74a). Inside it was a
5. Small pot of gray earth, fairly fine material and rough workmanship, but damaged on one side. Height 0.04 cubits (No. C. 164).
6. Pot of dark brown earth; shape as in Fig. 3 of the accompanying plate, with burnt human bones and ash. Height 0.24 cubits. (No. 82.)
7. Pot of brown earth; but damaged at the top. Height 0.16 cubits. (No. 91.)
8. Pot of light brown earth, with one handle, and with burnt bones and ash, above which lay some fragments of rough pottery, which may originally have belonged to a dish of 18 inches in diameter. Height 0.2 cubits. (No. 93.)
9. Pot of dark brown earth, badly damaged on one side, with burnt bones. Height 0.245 cubits. (No. 98.) [278]
10. Pot of dark brown earth, with burnt human bones. Height 0.205 cubits. (No. C. 99.)
11. Pot of brown earth, with burnt bones. Height 0.15 cubits. (No. 101.)
- 12th. Pot of dark brown earth, but half damaged at the top, with burnt bones. Height 0.27 cubits. (No. C. 109.)
- 13th. Pot of brown earth, of which the rim and handles have been broken away, with five roughly scratched lines above the body, with burnt bones. Height 0.16 cubits. (No. 119.)

The description of these 13 mortuary urns is taken from Dr. Jansen, "The Germanic and Nordic Monuments of the Museum in Leiden" (Leijden 1840), with an indication of the numbers under which they appear in the collection.

We also have the pleasure of mentioning two urns, which were donated by Baron van den Bogaerde of Ter Brugge to the Provincial Society in 's-Hertogenbosch and are preserved in the Library of that Society.

1st. Pot of Dark brown earth, slightly damaged at the rim. Height 0.16 ells. (See Fig. 2.) In this urn was found a 2nd small pot, also made of dark brown earth, which had suffered considerably. Height 0.073 ells. (See Fig. 4.)

Let us now adopt the learned observations of Mr. Jansen, as they appear in the Letterbode.

"The purpose of the urns," he says, "is beyond doubt; they were filled wholly or partially with cremated human bones, above which [279] was mixed earth with charcoal and ash; they were therefore funeral urns, containing the last remains of the cremated corpses. Less certain is the purpose of the small pots, which are sometimes found on top of, sometimes inside, and sometimes next to the urns. Only these can be considered certain as children's urns, whose bones indicate this. The ones known to us have not proven it. These (being five specimens examined by Mr. Jansen) contained a yellow, sometimes gray, earth mixed with ash, while only one contained a shard of bone. Recent archaeological discoveries, in similar jars discovered elsewhere, have shown that some served to contain something useful or beautiful. The often-held belief that they always contained the ashes of postpartum children is also contradicted by the very large number of these small jars found both in Deurne and elsewhere.

"That the urns and jars vary greatly in size, shape, and external appearance has been

60820 noted, and also demonstrated to us. The height and width are not proportional, but
all have a wide opening, suitable for placing objects, and resemble an ordinary tub,
while none are jar-shaped. Those currently in the Museum here seem rare; only one was
covered with fragments of a large bowl or tub, neither intentionally made as a cover,
60825 nor did it fit the urn. However, according to illustrations, one has been discovered
whose lid fit better within the urn, and one where it extended over the rim. Also
[280] only a few have one or two handles, and even rarer are those that had any
decorations, though a decoration that hardly deserves that name. In one in our
Museum, it consists of five lines, which run disproportionately under each other
60830 around the rim of the urn, and were scratched into it with a pointed tool when the
earth was still soft. However, according to illustrations, one has also been
discovered in which the lines lie perpendicular to each other, and another in which
they cross each other around the urn. The color of the one we saw is a mixed brown,
now more gray than yellow or red, depending on the earth from which they were formed
and the degree of heat used for firing. Some have been smoothed or rubbed fairly
60835 smoothly on the outside, but I have not been able to discover traces of glaze or
paint on any of them. The most remarkable aspect seems to be the roughness of the
workmanship. The material is poorly prepared and refined; the shaping was probably
done by hand, not on a wheel; this is at least clearly evident in the small pots and
the fragments of the aforementioned lid. The great fragility observed in some of the
60840 damaged pots rightly suggests that they were lightly fired, perhaps only dried in a
fire; to this fragility it is partly attributable that so few have come to light
undamaged. When one considers this crude and so little artistic progress-evident
character of the pottery, one cannot believe that it originated from the same people
who produced the finely wrought metals (discussed shortly). To think of Roman [281]
60845 work in the pottery forbids us from a deliberate comparison with similar objects of
Roman origin. Roman pottery, even the simplest, even that discovered in the poorest
graves, always showed us that meticulous workmanship, those proportionate shapes
created by skilled disc turning, that solid firing, those predetermined colors, and
precise decorations, which we lack in our own.

60850
II. METAL DECORATIONS.
The Rijksmuseum in Leiden preserves:
1. Copper chisel, set with verdigris. 0.087 ells long (No. 21a).
2. Copper chisel, set with verdigris. 0.062 ells long (No. 21b). See Fig. 5.
60855 3. Copper chisel, set with verdigris; but the fan is severely damaged. 0.067 ells
long (No. B. 21c).
Dr. Jansen raises the question of whether these chisels were not potter's tools. are.
If this is true, the urns must have been formed and fired in the burial sites
themselves, which is not impossible. However, I imagine that at that time a potter
60860 would have been responsible for making the urns, just as a coffin maker or some
religious or charitable institution is now responsible for making coffins. So, the
potter would no more have delivered his chisels with the coffin than a coffin maker
would have delivered his tools today. Since the knowledge we have of Germanic burial
sites is still so young and undeveloped, it seems to me that the time has not yet
60865 come to indicate the purpose and [282] use of the tools found in burial urns. Let us
describe precisely and provide accurate illustrations of what has been found, so that
the antiquarian, after us, will have sufficient information to form a more accurate
idea of the purpose and use, if this is feasible in the infancy of Nordic
archaeology. However, it speaks for itself, that one is obliged to provisionally name
60870 the objects, one will speak of them; but this is conditional, until they become more
familiar to us; for this reason, we approve the names that the scholar Jansen gives
to the objects found in Deurne, and we gladly adopt them.
4. Lance-point of copper, covered with verdigris, with two holes at the lower end for
attachment to a shaft. Length 0.115 ells. (No. 36.)
60875 5. Lance-point of iron, with two holes. Length 0.23 ells. (No. 38.)
6. Two fragments of a cloak hook, apparently made of copper and covered with
verdigris. (No. 53a.)
7. Disk of spirally wound copper wire, covered with verdigris; (Fragment of a cloak
hook). (No. 53b.)
60880 8. Two fragments of a copper hair pin, set with verdigris. (No. 53c.)
9. Fragment of a spirally wound ring, apparently made of copper and set with
verdigris. Average thickness 0.006 ells. (No. 56a.)
10. Fragment of a round armring (?) made of copper, set with verdigris. Thickness
0.036 ells. (No. B. 56b.)
60885 [283]

11. Fragment of an armring (?) made of copper, set with verdigris. Thickness 0.006 ells. (No. 56c.)

12. Leaf-shaped tool of cast copper, set with verdigris, provided with a split point and three elaborate holes, and sharp on the sides (see fig. 6). Dr. Jansen speculates that it may be a form for working pottery. Length 0.017 ell (No. 209*).

13. Two copper fragments, covered with verdigris, but deformed by burning; these appear to have formed the mouthpiece of a trumpet. Original diameter of the whole 0.045 ell. (No. 209a).

Besides these metal ornaments, the Leiden Museum also has a

14. Flat ring of grayish-red earth and finely worked; it probably hung from another ring as a neck or earring. Diameter 0.013 ell; thickness 0.005 ell. (No. B. 58a*).

We have listed these fourteen ornaments, which were found in burial mounds in Deurne, in the words of Dr. Jansen (German and Northern Monuments of the Leiden Museum).

His Honour, the highly learned scholar, had already introduced most of these objects in the Letterbode (1838, I. 390), where four metal ornaments are also mentioned.

After this statement, Jansen says:

"As far as we know, the aforementioned constitutes all the metals brought to light from the large number of mounds, and this rarity rightly aroused the surprise of Mr. van Voorst; it is also noteworthy that no objects of more precious metal, gold or silver, and probably [284] not even iron (a), have been discovered. The workmanship of these objects is very careful and precise; they are partly cast, partly struck and drawn, and, although devoid of figurative work, they betray a very advanced level of artistic practice and point to a people that must have reached a considerable height of civilization. If one considers the form and significance, and compares them with similar objects of undeniably Roman origin, one perceives the most striking similarity, a similarity that has struck us as so great that, had we found it among Roman objects, There would be no doubt whatsoever that they originated from a Roman factory."

That this advancement in civilization—which Dr. Jansen deduces from the objects found to have already existed among the inhabitants of Deurne during the pagan era—actually existed there when Saint Willebrord, along with Saint Lambert, converted the inhabitants of Peelland to Christianity, will be clearly demonstrated in our treatise: Saint Willebrord and Saint Lambert in North Brabant, drawn up from charters and contemporaneous documents, which we will report in a subsequent installment of this Miscellany.

III. SUSPICIOUS OBJECTS. The self-interest or contempt for everything alien to the short-sighted, which always tries to outwit the antiquarian, has been experienced more than once, to the considerable [285] detriment of Archaeology, so that in Deurne they would not have attempted to employ similar feats. When I was personally engaged in investigations in Deurne, I was exposed to the same deception. I was offered for sale an iron statuette that bore all the evidence of having previously served as a knife handle. My questions were met with such evasive answers, and the seller was so disrespectful that I rejected him with an attitude that clearly made him realize I considered him a deceitful and self-interested fraud.

In the Letterbode, Mr. van Voorst speaks:

1°. of a metal statuette, with a flat, square headdress, being a span long, and dressed as a... v. Erasmus in Rotterdam, with folded hands, in which a rosary can clearly be seen. "If this statuette was actually excavated," writes Mr. van Voorst, "then it is probably of a later date."

2. From a saber or blade. "But if this, says Dr. Jansen, was also excavated in Deurne, as Mr. van Voorst was assured, according to a letter addressed to me, it certainly does not belong to the burial mounds; since upon investigation it has shown us to be from so recent a period that it does not even reach the Middle Ages. Its imagery and obscured inscription convince us that it cannot date back to the time of Louis XIV. Blades from the previous century, less than a hundred years old, and from Amsterdam factories, bear the most striking resemblance to this Deurne one."

[286]

3. From an iron bolt or hammer. "Its owner, Mr. P. Guyot of Nijmegen, says Dr. Jansen, informed me that he had not considered it worthwhile to send it for inspection, as it bore too obvious signs of being an ordinary bolt from a very recent period."

We conclude these reports, referring to the Germanic cemetery in Deurne, with the hope that the owners of antiquities excavated there may be encouraged to donate them, in exchange for reasonable compensation, to the Provincial North Brabant Society in 's-Hertogenbosch.

Fig. 2-6. Antiquities found in Deurne.

60955 January 1, 1841 Deurne is a neat and prosperous village with an elegant church
and a beautiful tower, used by the Roman Catholic Church. The castle in Deurne is
still in its original condition and a pleasant place to stay. Diagonally across from
it lies a portion of another castle or house, where the naturalist Joannes Florentius
60960 Martinet once stood, who, according to Uilkens, contributed more than anyone to
popularizing natural history among our countrymen. Deurne, along with Liessel, has a
population of 3,256 inhabitants, who earn their living from agriculture and peat
cutting. A Germanic cemetery from pagan times was discovered in Deurne in 1837. We
were told that Mr. F. Baron van Voorst tot Voorst, a captain in the Hussar regiment,
first discovered these burial mounds. Thirty years ago, a shepherd had found an urn
60965 containing burned human bones, but, considering it the remains of a manslaughter and
fearing the police, he had kept the matter quiet and buried the bones and potsherds
back in the ground. The cemetery is bisected by a footpath on Asten, which runs all
around the heathland, and is 20 minutes from Deurne. It is approximately 500 paces
long and 150 paces wide. Approximately 100 hearses of all sizes had been excavated.
60970 This heathen relic provided ample material to help us forget the monotony of the
heathland.

January 26, 1841. In the department of Germanic and Nordic antiquities, from Major
General Rottiers, to whose zeal and care the Museum owes its possession of so many
60975 Greek works of art, a bronze statuette of a god, found near Aachen.
From Mr. P. O. P. Guyot, in Nijmegen, a most important collection of bronzes and
other objects, discovered near Deurne, in the province of North Brabant, largely
assembled by Captain Baron van Voorst and given to Mr. Guyot. This significant
acquisition, combined with the urns and other objects mentioned in our previous
60980 reports (Staats-Courant 1838 and 1839), now provides the Museum with the most
important and rare pieces unearthed during the discovery in Deurne. These, finally
reunited through various means, form a whole that can make an unexpected and
significant contribution to the knowledge of one of the ancient tribes that formerly
inhabited our country. In the Konst- en Letterbode 1838, May, pages 379-395, most of
60985 the objects were described by the Curator, Dr. Janssen. February 25, 1842 M. P. O. P.
Guyot à Nymègue d'une collection très-remarquable de bronzes et d'autres objets
trouvés près de Deurne dans le Brabant-Septentrional et qui pour la plupart avaient
été assemblés by M. le capitaine baron Van Vorst qui les remis à M. Guyot. This
important acquisition joint with urns and other objects was completed in 1838 and
60990 1839, with the Museum and possession of the principals and the additional rare
results of the fouille près de Deurne. After all, the preparations for maintenant

- March 31, 1864 [19] Roman objects from the estate of the late Mr. S. H. VAN DER

NOORDAA were also acquired, some from former inhabitants of our country:
61085 [20] a very beautifully polished flint axe, 12 dm long;
[21] a roughly worked trachyte BALL, 4 dm in diameter;
[22] a baked earthenware URN, filled with burnt human bones, 19 dm high;
[23] Another URN, 18 dm. high, containing the fragments of a bronze HAIR NEEDLE found inside;
61090 [24, 25, 26] Three more URNS containing burnt bones and
[27] remains of bronze RINGS, etc.; the urns were 10, 15.5, and 16 inches high; [28] Two CUBS, 9 and 7 dm.;
[29] Four POTS of various shapes, 6.5 to 9.5 dm. high;
[30] A beaker-shaped VESSEL, 5.5 dm. high, and some fragments of pots.
61095 [31] All these objects, with the possible exception of the WIGGE, were excavated in 1837 at the old cemetery in Deurne, North Brabant;
[32] a pair of trachyte stone MORTARS with PESTLES from the Deurne area, belonging to the estate of the late Mr. S. H. VAN DER NOORDAA, already mentioned several times;
[33] these now form a significant collection, together with the pieces found at the
61100 same location and donated to the Museum in 1840 and 1841 by the late Mr. P. O. G. GUYOT.

November 28, 1874 ANTIQUITIES.
The important collections of antiquities, works of art, books, and archives
61105 bequeathed by Mr. G. Ch. H. GUILLON, a living Notary in Roermond, will be presented at the request of Mr. C. Guillon, Attorney there, in the presence of Notary MAX. CORNELIS, at the house of his death, will be publicly sold on the following days, each journey beginning at 9:00 a.m.:
The Gothic cabinets and other objects of art on Monday, November 30th.
61110 The paintings and engravings on the following December 1st and 2nd.
The Archives on December 9th and subsequent days.
The prehistoric, Roman, Germanic, and Frankish antiquities on January 11, 1875, and subsequent days.
The intaglios (intaglios), Roman coins and medals, as well as the Medieval coins and
61115 other tokens, on January 18, 1875, and subsequent days.
All collections, with the exception of the library, will be sold for cash payment plus a ten percent surcharge for expenses.
Three months' credit will be granted for the payment of the books. Gentlemen
enthusiasts will be given the opportunity to view the collection for sale the day
61120 before the prospective sales, from 9 a.m. to 5 p.m.
The combined catalogs are available from the publisher of this newspaper for 60 cents. In addition, for requests outside Roermond, the postage is as follows: 22 cents to the Netherlands and Belgium, 55 cents to Germany, and 56 cents to France. Stamps are accepted to cover the purchase price and postage.

February 24, 2014 Response from Heikki Pauts of the Rijksmuseum in Leiden
- April 1884, inventory numbers ND 16-37 "From the collection of the late Mr. S.H. van der Noordaa, excavated in Deurne. Purchased at a sale in Amsterdam at Frederik Muller and Co. on April 8 and the following days, 1884, "in brackish soil."

March 1, 1890 Antiquities.
The famous MUSÉE GUILLON, collected over more than half a century by the accomplished
61135 antiquarian CHARLES GUILLON, Notary in Roermond, will be publicly SOLD on Tuesday, March 11-15, 2014, in Amsterdam by G. THEOD. BOM & ZOON, Spuistraat 135.
The collection includes Roman, Germanic, Celtic, and Medieval antiquities excavated primarily in Limburg, Roman and Gelderland coins and medals, Limburg coin stamps, Japanese lacquered and old oak furniture, porcelain, paintings, valuables, etc.
61140 Catalog f 0 25.

March 8, 1890. The catalog of works of art,
bequeathed by the late notary Guillon here, lists no fewer than a thousand Roman, Germanic, and Celtic
61145 Roman, Frankish, and medieval antiquities from the Stone and Bronze Ages, mortuary urns, Roman glass and pottery, over 70 pieces of beautiful red Samian pottery, a single silver-chased shield plate, probably from the latter part of the Roman Empire, over 80 carved stones or cameos, 1,400 antique gold, silver, and bronze coins, some

Naspeuringen van Paul Theelen: Constantinus Imperator

- 61150 medieval Gelderland and Limburg coins, coin dies and seals, as well as a small collection of silver chased coins, old furniture, etc.
The carefully edited catalog proves that much of interest can be found here for our antiquarians and archaeologists.
- 61155 March 10, 1890 Two very important auctions will be held in the coming days by the auctioneers G. Theod. Bom & Zoon, in Amsterdam.
- 61160 The first, containing the collection of antiquities and coins bequeathed by the late Mr. Charles Guillon, notary in Roermond, is of particular interest to students of the history of our country. Never before has such a collection of 1,000 Roman, Germanic, Celtic, Frankish, and medieval antiquities excavated in Limburg been auctioned. It offers us a glimpse into the customs and traditions of those times. Both the Stone Age and the Bronze Age are amply represented, while the collection of Germanic pottery, including many urns containing the ashes of our Germanic ancestors, may be considered among the richest. The Roman glassware and pottery, urns, etc., including the beautiful red pottery from Samos, are also worthy of interest, as is the umbo, or shield plate, embossed in silver and high relief, a masterpiece of chased work from the period of the Bas Empire. This collection also includes a collection of over 80 mostly antique carved stones or cameos, antique gold, silver, and bronze coins, some
- 61170 medieval Gelderland and Limburg coins, etc., etc.
The second, more limited collection contains a collection of antiques, silver chased pieces, antique furniture, historical and Amsterdam rarities, valuables, porcelain and Delftware, horns and shells, paintings, stereoscopes, glass stereoscopic slides, etc.
- 61175 These items can be viewed in the firm's salesroom, Spuistraat 135, Saturday, Sunday, and Monday, March 8-10, from 10:00 AM to 3:00 PM.
- 61180 March 10, 1890, Tuesday morning, Ten o'clock: SALE at G. THEOD. BOM & ZOON, Spuistraat 135, next to Die Port van Cleve.
Guillon Collection: Stone Age and Bronze Age Antiquities, Germanic Urns, No. 1-813. At six o'clock in the evening: Ancient Roman Coins, beginning with No. 1. The Sellers will be greatly obliged by returning the Guillon Catalogue.
- 61185 March 14, 1890. The collection of Limburg antiquities, currently being sold by G. Theod. Bom & Zoon, on Spuistraat here, and originating from Mr. Ch. Guillon of Roermond, appears to have attracted general attention. Fortunately, the majority of it remains in our country and was purchased primarily for the National Museum of Antiquities in Leiden and the Maastricht Museum of Antiquities. The remainder went to private individuals, while a few very fine pieces
- 61190 were purchased for English money. No. 79, a stone axe, fetched 14 guilders; no. 38, a similar 11.50 guilders; no. 160, stone arrowheads, 15 guilders; no. 167, a stone poniard, 26 guilders; no. 199, a bronze razor, 10 guilders; No. 200, a sword blade, f28; No. 300, a Germanic cup, f12; Nos. 314 and 315, two bronze statuettes, f39; No. 321, two copper ornaments of a tripod, f14; No. 329, a similar incense box with spoon, f13; No. 336, a plaque with Jupiter and Hebe, f48; No. 410, a Roman flask, f35; No. 411, a similar smaller one, f20; No. 427, a Samian earthenware vase, f32. The auction continues.
- 61200 December 1, 1894, Sale of Weapons and Works of Art in Cologne.
[...] 2nd. Art collections of the late Honourable Gestr. Mr. C. Guillon, lawyer in Roermond, [...] Sale 12-18 December 1894.
Price of the illustrated catalogue 3 Marks.
J. M. Heberle (H. Lempertz's sons), Cologne.
- 61205 May 4, 1929 [...] In Roermond, in 1874, a highly important sale of documents, archival materials, and old curiosities took place. It was the sale of curiosities bequeathed by the late Mr. C. Guillon, lawyer and notary in Roermond. This rare collection, containing approximately 10,000 items, went under the hammer, and the sale, which lasted from November 30, 1874, to January
- 61210 19, 1875, had a section entitled "Manuscripts, Archives, and Other Historical Documents," which contained nearly 1,000 items. The catalog of this sale has already become a work of bibliophilic value. [...]

Eindhoven, February 27, 2014

Dear Mr. Louer,
Please find attached a file on finds in the Peel region. I am very interested in objects that have not yet been described. I also refer you to www.theelen.info.
Kind regards,
Paul Theelen

Dear Mr. Scheijvens,
Following our telephone conversation, I am attaching information about objects found in the Peel region, primarily during peat cutting. For further information, please refer to the comprehensive website www.theelen.info, which also includes the table of contents so you can search using keywords and then jump to the relevant file.
Kind regards,
Paul Theelen

February 27, 2014, from Ronald Louer (rlouer@brabant.nl)
Dear Mr. Theelen, Dear Paul,
Enclosed is an inventory of finds from the Peel region (Helmond, Laarbeek, Gemert-Bakel, Deurne, Astén, Someren, and Geldrop - excluding the place name Mierlo) that have been catalogued in the Provincial Depot of Archaeological Finds in North Brabant. The entire collection has not yet been inventoried, so there may be more finds from those municipalities in our depot. The Province of North Brabant has only been responsible for the Provincial Depot of Archaeological Finds in North Brabant since 2000. Before that, this depot was the responsibility of the national government. Since 2000, we have been reviewing and inventorying the entire collection. Finds made before 1960 generally fall under the Noordbrabants Museum (as a continuation of the Provincial Society of North Brabant) or have ended up in other collections, but some of these older finds have been found in our depot. If you have any further questions, I am happy to answer them to the best of my ability.
Sincerely,
Ronald Louer | Manager of the Provincial Depot of Archaeological Finds in North Brabant | 06-18303225

March 10, 2014 to avanpinxteren@hnbm.nl
Eindhoven, March 10, 2014
Dear Mr. van Pinxteren,
I am currently compiling an inventory of finds that have been found in the peat bog of the Peel region. Finds from the peat areas in the north of the country are included because somewhat more have been found there than in the Peel region. I am specifically requesting information regarding the cemetery south of Deurne, which was discovered in 1837. Although, strictly speaking, this is not part of the peat bog. Objects such as urns with contents have ended up in your museum; some mortars (probably from the Middle Ages) also came to you via the Leiden museum around or after 1875, or they have disappeared...
Could you, using the updated files, search for the aforementioned urns and metal objects, whether purchased or otherwise acquired by the museum? Thanks in advance,
Paul Theelen See also www.theelen.info

ON THE GOLD NECKLACES AND RINGS FOUND IN VELP, NEAR ARNHEM
BY Dr. L. J. F. JANSSEN, CONSERVATOR AT THE MUSEUM OF ANTIQUITIES IN LEIJDEN.

With illustrations.
NOT SOLD SEPARATELY.
IN ARNHEM, WITH IS. AN. NIJHOFF. 1851.

Among the rarest discoveries recently made in our country are the gold ornaments mentioned at the beginning of this article, which are reproduced hereinafter in precise illustrations. This great rarity is the reason why we are publishing them soon and accompanying them with a brief explanatory note. We found this all the more compelling reason because an earlier report, circulated by the newspapers, had given rise to the erroneous belief that these objects were from the chivalric era or from some noble family, thus of very late origin (*). Before I proceed to clarify this, I would first like to offer my sincere thanks and appreciation to Mr. T. BRANTSEN, mayor of Reeden et al., for his cooperation in preventing these objects from being scattered or thrown into the melting pot, as well as for the opportunity he gave me

to examine them accurately.

(*) See, for example, Algemeen Handelsblad, January 15, 1851.

to examine them, and, with the owner's consent, to have them reproduced under my supervision. Indeed, even if my illuminating notes were of no value, these images would still be of great importance, as they prevent science from being too severely damaged in the event of the possible loss of the original pieces, and because images of single memorials like these significantly enrich the building material of archaeology.

I will 1.) briefly report the discovery, with regard to the exact location and manner in which the objects were found, according to the finder's reports and an autopsy; 2.) describe the found objects in those details that could not be determined by the images; 3.) attempt to shed some light on their age, origin, and intended purpose.

1.

On January 16, 1851, the gardener CARRO of Velp, in the garden of Mr. J. J. JOBIUS [JORIUS], accidentally discovered eleven gold ornaments while turning the soil: neck and finger rings, all hanging from one of the large neck rings (see Fig. 1), and apparently placed in the ground deliberately, though in ancient times. The depth at which they were found was over half a Dutch ell, and they lay on the usual sandy soil of the area. This garden was formerly communal land; near the spot where the objects were found, the villagers used to collect their sand; only later was the land cultivated and transferred to private ownership. The discovery site is situated quite high and appears to have been somewhat higher in the past than it is now. Apparently, it is situated at the same elevation as the Reformed Church, which is approximately 250 yards south of it. Neither under nor around the objects was anything other than ordinary sandy soil found; no trace of burning was discovered, nor any evidence that the pieces had originally been enclosed in a cloth, box, or similar object. This is all the more certain because the entire garden and even adjacent fields were carefully turned over after the discovery, in the hope of finding something, but this effort was entirely fruitless. The precise location of this discovery is not without importance, because in 1715, in the same village, a treasure of ancient gold objects was also discovered (mentioned below), from which these ornaments receive some clarification.

2.

Of the eleven rings, only eight are depicted here, because four were similar in shape and decoration, so that three can be sufficiently identified by reference to a single illustration.

Fig. 1. Neck ring; heavy 7 lead, 7 wedges; fineness 18 carats; gold value f95.50.

Fig. 2. Neck ring; only the front part of the clasp is depicted, because the rest corresponded exactly to Fig. 1; heavy 5 lead, 7 wedges, 3 grains; fineness 18 carats; gold value f71.

Fig. 3. Neck ring; heavy 5 lead, 8 wedges, 3 grains; fineness 18 carats; gold value f72.05. There are three more of this type, which are not depicted, because their shape and decoration were completely identical to this one. Only one of these three is missing the small cluster of decorations seen on both sides of Fig. 3. The weight of one of these three is 7 lead, 3 wedges, 8 grains, the gold value f91. The weight of the second is 7 lead, 5 grains, worth 87.40 guilders in gold; the weight of the third is 8 lead, 7 wedges, 7 grains, worth 106.20 guilders in gold. All are 18-carat fineness.

Fig. 4. Necklace; weight 4 lead, 1 wedge, 6 grains; fineness 18 carats; worth 51.55 guilders in gold.

Fig. 5. Spiral, as a finger ring; heavy 3 lead, 9 wedge; fineness 18 carats; gold value 48.35 guilders.

Fig. 6. Fragment of a ring, deliberately bent, and very likely a ring like Fig. 4 or 5. Heavy 7 wedge, 2 grains; fineness 24 carats; gold value 11.20 guilders.

Fig. 7. Finger ring, provided with an oval, hollowed-out shield, which would originally have contained an engraved stone. However, the stone was missing when it was found, and was probably already missing when the ring fell into the ground, as the finder assured me that he found nothing but sand in the hollow of the shield and searched in vain for the missing stone. This ring shows signs of having been worn extensively. Heavy 1 lead, 2 grains; fineness 24 carats; gold value 15.90 guilders.

Fig. 8. Finger ring, on whose square shield the bust of a warrior is deeply engraved (en crux) and surrounded by a pointed border; the warrior appears to be a barbarian,

not a Roman. Weight 1 lead; fineness 18 carats; gold value f12.40.

61350 This statement shows that the eleven gold rings together weighed 53 lead 4 grains, with a gold value of f652.95 (*), and that they were made of 18 carat gold, with the exception of Figs. 6 and 7, which were fineness 24 carats.

* The appraisal was done by M. C. MENTE, a goldsmith here.

61355 All objects showed signs of wear, some more, some less; the finger rings Figs. 7 and 8 showed the most. The round portion of the neck rings had several small curves, which could have been caused by frequent putting on and taking off, which forced the rings to bend, or by repeated pressure from other objects that may have rested on them.

61360 All were hand-worked; even the round portion of the neck rings, evident from small irregularities, has been hammered out of the band. The flat portion is three-sided on the outside; see the cross-sections in Fig. 1. b, c, and d. The decorations were stamped in, not hand-engraved, which is especially evident from their perfect uniformity. They demonstrate great taste and artistry. The circles in Fig. 6 are only on one side, which would have been the outer edge of the ring. The bust in Fig. 7 appears to have been hand-engraved.

61365 The closure of the neck rings is the same on all of them; namely, an acorn-shaped eyelet (see Fig. 1a), through which a pointed button was inserted. Furthermore, the neck rings, especially at the front and on the outside, have a brownish color, from which the goldsmith charged with the appraisal concluded that they were originally deliberately colored.

3.

61375 To judge the age, origin, and purpose, we have, due to the lack of inscriptions (such as coins and memorial stones), only the objects themselves as guides, and must therefore seek light from these, compared with others found elsewhere.

61380 The eye is involuntarily drawn first to the finger ring Fig. 7, which bears a bust. One hopes that the portrait will be recognized and verified by history. But in the rough features in which that image is depicted, we have searched in vain for a known person. It is not a Roman emperor. The head is adorned with dense and small curls, or with a fur cap. On the chest and shoulders, one sees the folds of a cloak, and possibly the upper edge of a shield is indicated under his chin. He appears to be a barbarian, although I have not found the image among known barbarian princes.

61385 However, one would more likely suspect him of being a barbarian than a Roman, because the specific characteristics of the Roman character and costume are lacking.

61390 Meanwhile, the workmanship and shape of the ring itself are similar to those of Roman rings from a later period. In shape and rough workmanship, it is similar, for example, to the ring at ARNETH, Gold- und Silberwerke u. s. f., Tab. G, S. XX No. 152, S. 33, on whose square shield the busts of Constantinus Jun. and his wife are engraved; as well as to the ring from Louisendorf, with the inscription FIDEM CONSTANTINO, depicted in my "Memorials of the Germans and Romans, etc.," pl. XVI, 6-8, and to another from the same region, exactly identical to the latter, in the possession of Mr. P. C. G. GUYOT in The Hague (*). But I would consider our Velp ring to be from even later than the Constantinian period. This is prompted by the consideration of the gold treasure found in the same village in 1715, which included coins from the period of the

61400 (*) Mr. GUYOT's ring was found in the vicinity of Kleve in 1850 and is so excellently preserved that it could be considered new. Since two finger rings have now been found, completely identical, including the inscription, and from the same region, one may assume that they were donated by one of the Constantinians.

61405 municipal commanders, probably of barbarian auxiliaries, were given, as was very common, especially in that period.

61410 Constantinians were, and later ones too, the youngest of the tyrant John, whose last coin (MEDIOPARBI, p. 537) is from the year 425. This golden treasure, not unimportant for elucidating our ornaments in general, may be briefly mentioned here, especially because it is little known and can only be known incompletely from written works in Dutch. Some reports about it can be found in ENGELBERTS, *Aloude staat*, IV. 336; G. VAN HASSELT, *Arnhemsche Oudheden*, IV. 1-3; REUVENS AND WESTENDORP, *Antiquities*, III. 148, where mention is also made of STARING, in the *Verh. der Haarlemsche Maatschappij*, XI. 451 (1822); IS. AN. NIJHOFF, *Wandelingen in de Omstreken van Arnhem*, 5th ed., p. 107, where KILIAAN, *Etymol. voce thunderstone*, was also

- 61415 mentioned; but the most voluminous and contemporaneous documents can be found in G. CUPER, *Lettres de critiques* etc., Amsterdam 1742, 4°, p. 179, and in the *saggi di Dissertat. Accadd. di Cortona*, tom. IV. p. 255 sqq. (Roma 1743, 4°), *Dissert. YI**, sopra alcune medaglie d'oro, divisa in tre letterse, due di GISBERTO CUPERO ed una di Mr. FRANSCISCO BIANCHINI.
- 61420 In both of the latter works, there are also two images of medallions by Honorius and Galla Placidia, rounded up from that treasure (*). The following report is taken from these documents.
- 61425 At Laar(\$), in Velp, in 1715, workmen and soldiers, while digging and leveling a barren and hilly piece of pastureland (sterile prato), belonging to a tobacco merchant, discovered this treasure.
- 61430 (*) ARNETH, who in his *Gold- und Silberw.*, p. 7, cites this Velp gold treasure as one of the most important gold discoveries in Europe, and who cites the *Lettres de critiques* l. c. as his source, incorrectly named Velperg as the discovery site, instead of Velp, and listed Cuper GISBERT as the describer, instead of the renowned scholar GISBERT CUPER.
(\$) Laar, ed. Lár ~ dwelling, house; see GRAFF, *althochd. Sprachschatz*; II, 143; cf. MEIJER *Zurich. Ortsnamen* S. 10 (1849); and L. P. C. VAN DEN BERGH, *Krit. Woordenb. der Ned. Myth.*, p. 124.
- 61440 While he wanted to improve it into tobacco land, a gold treasure was found with a gold value of 10,000 to 12,000 guilders. It consisted of a necklace (collier), bracelets (brasseletten), coins, and medallions. Everything lay in the loose earth, but the necklace and bracelets were laid in a circle; the center of this circle was covered with medallions, which had decorative borders and were placed next to each other in such a way that they formed a kind of floor, five of these medallions being attached to the necklace (*). On these medallions, the smaller gold coins were placed side by side. The finders immediately divided the treasure, made off with it, and sold the majority to goldsmiths, who threw it into the melting pot, so that the
- 61445 combined find has never been seen by any connoisseur or enthusiast. Meanwhile, Cuperus had the privilege of viewing another thirty of the gold coins found in Arnhem and even purchasing two of them, one by Honorius and one by Valentinian; the others he had seen belonged to Constantine the Great and his sons, to Valens, Gratian, and other emperors of the time, as well as one by John. He also saw a few more medallions
- 61450 in Arnhem, specifically one by Honorius and one by Galla Placidia (\$). According to the information of Cuperus (who cites Baron Van Spaen of Biljoen as an informant), the brasselets and the necklace
- 61455 (*) For examples of how such medallions hung on the necklaces, see the *Hist. Ant. Mittheilungen* of the Society of Antiquities in Copenhagen, pages 97-98, fig. 1, and in Arneth l. c. Table G. L., p. 8.
(\$) Both of these were published in the aforementioned treatises. The medallion of Honorius was then in the possession of Mayor De Groot of Arnhem, and that of Galla Placidia was with Baron Van Spaen of Biljoen. Later, the Galla Placidia came into the collection of Mr. Van Damme; see Engelberts l. c., and from there passed into the Royal Collection in The Hague; see J. C. De Jonge, *Notice*, p. 99.
- 61460 have melted down. ENGELBERTS, on the other hand, reports that the necklace "is still kept as a baptismal ornament by a certain family." ENGELBERTS had not seen it with his own eyes, nor did he describe it or name the family; but his assurance seems beyond doubt. If it were still kept by any family, they would certainly oblige science by reporting it (*). ENGELBERTS also reported that Mr. VAN DAMME from the same area (Velp) owned an unusually large medal of Constantine the Great, which, however, had not been attached to the gold necklace, as well as a heavy gold finger
- 61470 ring, or ring, decorated with inlaid figurines of the early Christians (and?) with a sapphire stone, depicting the Empress Helena. From this report, one seems to infer that these objects also came from Velp. Regarding the discovery site, Het Laar, we read in CUPER's account that some, because of the mounds that had formerly been in that field, had thought this golden treasure came from a burial ground. However,
- 61475 CUPER considered this improbable because, according to him, not the slightest trace of a burial ground was found during the demolition of the mound where these objects lay, and because burial with treasure was no longer common among the Romans at that time.
- 61480 We agree with CUPER on this point; But we must not fail to note that it has not been proven that the treasure was hidden there by the Romans, and that barbarians at that time were indeed in the habit of burying it with their deceased treasures. —

(*) But it probably no longer exists. After all, the aforementioned Mr. Brantsen told me that he had only a vague idea that the necklace had been in his family, but that it had been converted into currency during the French occupation.

From these statements, one may conclude without presumption that the gold discovery at Laar dates from the first half of the fifth century, because the youngest coins were from the beginning of the fifth century. And this is the reason why we have raised the suspicion that our gold ornaments date from a slightly later period than that of the Constantines. Indeed, both gold discoveries may well be considered simultaneous or nearly so, since Laar is only 10 minutes away from the site where our objects were found, and because neither find yielded any traces of burial, but rather that they were deliberately buried in the ground and not lost by chance.

The finger ring, Fig. 8, which originally contained an engraved stone, is so strikingly similar in form and workmanship to Roman finger rings that we need not cite any examples for comparison. However, the situation is different with the other ornaments, particularly the neck rings. These do not correspond in either form or ornamentation to the Roman ones we know. At first glance, one might even suspect that they were rather head rings, diadems; after all, their shape is somewhat similar to that of some diadems from classical antiquity: see, for example, the illustrations in CAYLUS, Recueil, I. partie 4, ri. LXXXV, 4; MONTFAUCON, Antiq. expliq. III Pl. XX. and XXV, and BOLDETTI, i cimiteri etc. p. 526. Mr. HIIDEBRAND, supervisor of the Museum of Antiquities in Copenhagen, who (28 August) saw the drawings of our Velp ornaments here, also recently told me that gold diadems of a similar shape had been found in Sweden, which were suspected there of being of Eastern origin. Meanwhile, these Swedish diadems were so different from ours that they were closed at the back and open at the front (perpendicularly cut) and therefore elastic. However, our Velp rings cannot be mistaken for diadems, because the wide, flat portion of the clasps runs counter to the back closure, so that if they were used as diadems, they would not lie flat against the forehead, but would injure the head with the sharp point of the front; whereas, placed around the neck, they fit very effectively with the flat front against the breastbone, and the decorated portion is therefore visible to everyone. This purpose is beyond doubt, and if any doubt remains, it will disappear upon consideration that similar rings have been found elsewhere fastened around the necks of corpses. However, these rings found elsewhere are few in number and extremely rare. They were found in a region that has so far been little explored for comparative archaeology, and we are all the more willing to mention them because they are the only examples from all antiquity (at least as far as I know) that closely resemble our Velp neck rings.

In Livonia, east of the Baltic Sea, DR. F. KRUSE, the tireless researcher of monumental antiquity, has recently conducted many excavations, particularly in burial mounds of the oldest inhabitants there. He shared his findings in the work "Necrolivonica," published in Petersburg in 1842. There, Tab. 4, fig. N. (cf. p. 7 of the text), one finds a bronze neck ring depicted, found in an old grave at Aschenraden and still attached to the skeleton's neck. This neck-ring is remarkably similar in shape to ours (namely Figs. 1, 2 and 3); it is, like ours, hammered out on three sides at the front, while the rest is round. It differs only in that the ornaments are not entirely the same, and that the closure is not exactly at the back, but on the right side of the neck. On the wide front, there are also some bronze clasps, which are almost shaped like spoons from ancient hair tongs (tweezers). This last detail, however, does not detract from the similarity in the least, because according to Kruse's reports, such neck rings without clasps have also been found in Livonia. At Ronneberg, in an old grave, he discovered two such neck rings, one above the other, around the neck of a male skeleton; these are depicted at the top of Table 27, fig. 8. A neck ring was found at Kerklingen, in Kurland, and at the top of Table 27, fig. 8. 41, fig. 3, depicted, is decorated on the front, on the wide part, with a decoration that completely resembles the triangular decorations of our rings; but this neck ring is rope-shaped at the back. Furthermore, what KRUSE reports regarding the decorations on the Aschenrade antiquities is noteworthy. These decorations generally consisted of circular eyelets (sometimes one eyelet with a double outline, sometimes two single eyelets below and one above), zigzags, and small squares. Such decorations are also found on our rings. Regarding the rarity of these objects, KRUSE states that he had never encountered a ring similar to the Aschenrade one, neither in Germany nor in Scandinavia. This testimony is significant coming from an antiquarian with as much experience as KRUSE. We permit ourselves to add only that we are not aware of any such neck rings from Britain (*), France, and Belgium (\$), while the classical art

- 61550 (*) In this connection, I must also note that, according to ARNETH I. c., a gold torque, broad on one side like a diadem, was found in Cornwall in 1783, depicted in LYSONS, Magna Britt. III. p. CCXXI, and a bronze one, depicted in the Archaeologia, XIV, 94. But the rings mentioned in those works bear very little resemblance to ours.
- 61555 (\$) It should be noted that this by no means denies that the Germans, Britons, and Celts living in those countries generally did not wear neck rings. The opposite is well known; there is ample evidence for this, which can be found from ancient writers and monuments; We will, however, save this discussion for another occasion, as we must now concentrate on brevity and will only touch upon the most necessary points that serve as clarification here.
- 61560 works from Greece and Italy (including the Etruscans) offer no comparison other than the aforementioned, rather inconspicuous, diadems (*). The evidence will undoubtedly have demonstrated the extreme rarity of these objects; even rarer than the Aschenraden by KRUSE, insofar as these were made only of bronze, while ours, on the other hand, are made of gold.
- 61565 The few explanations KRUSE has provided regarding the origin and age of the Aschenraden rings cannot be of any use to us, as they consist only of quotations from ancient Nordic and Russian authors, relating to the use of neck rings in general and dating back no further than the eleventh century. KRUSE may have judged his Aschenraden objects to belong to that late medieval period, although he doesn't
- 61570 explicitly say so. However, if he were of that opinion, our Velp neck rings would certainly lead him to a different conclusion.
- 61575 * A small, flat, diadem-shaped gold finger ring, found near Wijk bij Duurstede and now in the Museum of Antiquities here, may be compared from afar. This one is decorated on the outside with triangular figures, provided with eyelets, and enclosed in a pointed edge; it is open at the narrow end and therefore elastic, unlike the aforementioned Swedish diadems, although in those cases the opening was on the wide side. This Wijk finger ring was judged by the Swedish antiquarian, Mr. HILDEBRAND, to belong to the fifth century. For the shape of this Wijk ring, compare the arm ring in WORSAAE, Dänemarks Vorzeit, p. 46, and for the decoration, p. 47.
- 61580 Regarding the specific tribe from which they supposedly originated, KRUSE also offers no clues. But if the graves he found at Aschenraden belong to a people indigenous there, then in our view they belonged to a Nordic tribe, for it is plausible that the peoples who formerly lived close to the eastern coast of the Baltic Sea (specifically
- 61585 its southern part) were of the same tribe as those on the western coast, which now belongs to Sweden. According to MONE, Gesch. des Heidenth., I.7,66, the Livonians, Ebstlanders, and Kurlanders were attributed to the Finnic lineage; but regarding the oldest peoples on the Baltic coasts, see especially Grimm, History of the German Language, p. 716 A.D.
- 61590 The neck ring Fig. 4, which consists entirely of round, hammered gold wire, must be attributed a similar origin due to its similar closure and similar gold content. We will not dwell on this in detail; it is apparently of the simplest type; but it was possible that it originally held ornaments; at least, the completely round clasp is very suitable for this, and such round neck rings, with objects hanging from them,
- 61595 have sometimes been found (*).
- 61600 The heavy spiral ring Fig. 5, which could have been used as a finger ring, although its size and weight must have somewhat hindered the free movement of the finger, seems, like the previous one, not to be Roman, but barbarian in origin or purpose. One could argue against this that the Romans in the later imperial period took the luxury of wearing many and heavy finger rings to great lengths, and that they sometimes covered all their fingers, up to the top, with them without taste; see QUINTILIAN. XI, 3, MARTIAL. XIV, 123, and especially XI, 59, where he lashes Zoilus with bitter mockery.
- 61605 (*) For example. in Normandy; see the yearbooks of the Societé des antiquaires de Normandie, 1827-1828, pl. 20 No. C. Tombeaux Gaulois-Romains.
- 61610 Zoile, quid tota gemmam praecingere libra
Too juvat et miserum perdere sardonycha?
Annulus iste tuis fuerat mode cruribus optus,
Non eadem digitis pondera conveniunt.
- 61615 But spiral finger rings as heavy as ours are not known to me from the Romans, neither in figurines nor in originals. On the other hand, they have been found among Germanic-Nordic objects. We will mention only one example, which offers the greatest resemblance to our ring. In 1833, a gold treasure was discovered in Fühnen, consisting of arm rings, brasselets, cloak hooks, medallions, etc., together weighing

8 pounds 7 lead (Nordic weight); among these was a heavy, solid gold spiral finger ring, similar to ours; see the illustration in the Hist. Antiq. Mittheilungen der Societät für Nord. Allerth., Table V, 13, compare the text S. 92-97. This Fühnen ring is only slightly shorter than ours, and tapers at both ends; But it was possible that our Velp ring had originally been somewhat thinner at both ends, and that those ends had been removed for commercial use (see below). It is also worth noting that the medallions with which the Fühnen ring was found were barbaric imitations of coins of Constans and other successors of Constantine the Great, and that the learned Nordic reporter correctly concludes that this gold treasure, which was of Nordic manufacture, must be dated to the fifth century. (*)

(*) Germanic gold spiral finger rings found in Meklenburg, see mentioned and illustrated in the Frederico-Francisceum, Table XXIII, 1,4, 6-8, compare the text of LISCH, Table 137, 138, and LISCH, in the Jahrb. für Meklenb. Gesch. u. Alterth., W, 269, 270; and in the Holstein, b[j] RHODE, Holst. Cimbr. antiq. Rom. p. 137, fig. 1, 4, pp. 142-143, fig. 2, 3. All these rings, however, are noticeably thinner and finer than the Fühnen and our Veluws rings.

This similarity with Germanic-Nordic rings is no less striking in the decorated fragment Fig. 6. For among the Fühnen objects were four similar broken and bent pieces of rings (some spiral-shaped), which were roughly hung together like a chain; see the illustration in the aforementioned Mittheilungen, Tab. V. Fig. 15. The publisher quite rightly characterizes these as "broken, bent, and linked rings, for the purpose of trade" (trade and circulation). Ring money was in use among many ancient peoples, not only among the Norwegians, but also among the Celts, and even among the Hungarians; see for brevity's sake SCHREIBER, Taschenb. für Gesch. u. Alterthümer in Süddeutschland 1840, and Nachtrag inden Jahrg. 1841, p. 401. From what has been presented thus far, the following conclusions may be drawn.

1. The gold ornaments found in Velp, in terms of their antiquity, can most likely be dated to the first half of the 5th century.
2. The large rings were men's neck rings; one person could wear more than one at a time (one over the other). are. This may also clarify why the rings are so bent and dented; after all, men would have handled them more roughly than women tend to; and if these men were warriors, as is likely, then the rings could also have been bent by weapons that may have pressed against them.
3. The smaller rings were finger rings; due to their size and weight, probably also men's; while the spiral ring and the curved fragment would also have been intended to be cut into pieces during trade, purchase, or exchange.

4. Most rings exhibit a non-Roman, barbarian style in shape and decoration, and in this respect most closely resemble objects from the north, found on the coasts of the Baltic Sea.

5. The non-Roman character of the rings does not yet allow us to conclude with certainty that they were made by barbarians; for it was possible that they were made by Romans in a barbarian style and given by the Romans as gifts to barbarians to gain their favor, reward their loyalty, or buy off their threats; of which numerous examples from that period are found in history. (*)

6. The earlier discovery, in the same village, of a treasure of Roman coins, medallions, etc., might reinforce the idea that the ones found now were also made by Romans. But it was also possible that the previously discovered treasure had been plundered by Roman barbarians, or captured in victory and temporarily stored there. In this case, one should not draw any conclusions from this regarding the Roman production of our ornaments.

7. The similar manner in which both treasures were buried in the ground, and the proximity of the two discovery sites, lead to the conclusion that both treasures were buried simultaneously, or on the same occasion and by the same people, or by people of the same people. -

I think I should refrain from making any conjectures regarding the specific tribe that made our ornaments

(*) How dependent the Romans were on the bat baron at that time, and what extorted gifts cost them, is important evidence of the testimony of SALVIANUS Massiliensis (from the fifth century), the governor. Dei, VI. 211, p. 129 (edit. Brem. 1688). For the rest, we refer to GIBBON, Gesch. des Röm. Weltreiches, uebers. von SPORSCHIL, Leipzig 1840, Th. VII. Chap. LVI. P. 4-90, where the main sources are cited.

buried in the soils. Too large a field lies open here. What peoples from the North, East, and West did not harass the Roman Empire in the first half of the fifth century! The increasingly sinking Western empire was alternately assaulted and undermined by Getae, Gepids, Avars, Quadi, Alans, Suevi, Wandals, Franks, and Huns,

sometimes friendly to each other (*). Aetius, a Scythian by birth (\$), who matured under the Hunnic tents, having risen to the head of the Western empire (433-454), spent twenty years solely delaying its fall by defending it against barbarians, while in numerous battles in Gaul (†) he subdued the Franks on the Rhine and the Burgundians (**). I hope to return to this subject in due time and to be able to recommend a specific conjecture. For now, I will only permit myself the observation that no traces of a battle fought there have yet been found in the vicinity of Velp. Even in the unfortunate forest, I have searched in vain for undoubted burial mounds. A single funerary urn, reportedly discovered earlier at the Essop (\$\$), and the few remains of an old burial, which I excavated in a hill in the spring of this year in the so-called Stadsbosch near Arnhem, above Valkenhuizen, prove too little (††). The Germanic graves in Apeldoorn are somewhat distant.

(\$\$) IS. AN. NIJHOFF, Walks in the vicinity of Arnhem 5th edition, bl. 108.

(††) G. VAN HASSELT collected on his estate Daalhuizen near Velp, besides rare Roman coins, also urns or coffins and javelins (frameae)", as NIJHOFF, t. a. pl. p. 89, according to oral information from Mr. VAN HASSELT, but neither their number nor Neither the type nor the discovery sites are known, so no conclusions can be drawn from them.

The simplicity of the contents and the lack of weaponry suggest that it dates back to the fifth century and not to having been killed in battle (*). It is possible that those who buried these treasures in the Velp soil fled from the left bank of the Rhine to the right, the Germanic one, and considered their temporary preservation safe at this isolated spot between the Rhine and the IJssel. All this does not deny the possibility of what has been suspected regarding the previously discovered gold treasure: that it was part of an imperial treasure; but even in such a quantity, it would certainly not have been recovered by order of an emperor, who would have provided better clothing, but rather should be considered stolen, as looted.

Leiden, September 15, 1851.

POSTSCRIPT.

After the above had already been largely printed, I found, in my work, Neues vaterländ. Archiv – von SPIEL, fortgesetzt von SPANGENBERG, B. IV. Heft 1 S. 184 (Luneborg bei Herold 1823, 8°), which is rare in our country, a report concerning the discovery of a golden treasure in Hanover, not mentioned elsewhere as far as I know, and which included a collar that seems to have had some similarity to our Velp treasure and also belonged to around the same time. We

(*) Regarding the Apeldoorn graves, see my essay: Ancient Germanic and Frankish Antiquities in Apeldoorn, in these Contributions, D. VII, pages 320 et seq.

I will include that report here, also in the hope that it may help to elicit a more accurate and illustrated description of this treasure, or an indication of where it can be found? The aforementioned report is by Dr. KOELER of Zelle and reads as follows: "On May 31 (1823), the treasurer CLAUS BÖSCHEN of Mulsuwer Wiede, in the office of Dorum of the Wursten district, near the Hollseler forest, in the Heidestatt region, while cutting sods, found a gold ornament belonging to an old leader from the past, just below the surface of the ground. It is most likely to be mistaken for a necklace and weighs about half a pound. Where it is somewhat wider, a few small half-moons have been added for decoration. At the same location, five ancient Roman coins were found, all fitted with eyelets and which appear to have hung from the thin end of the necklace. On them are the names of ANASTASIUS and VALENTINIANUS, and repeatedly the words victor and victori (VICTORINUS?). On one, which appears to be the oldest and is already quite worn, there is a head with the inscription RESTITVTOR REIPVBLICAE and below the head ANT ... S. If this is to be called ANTONIUS, the piece would be older than the Christian era. Each coin weighs slightly more than a ducat, and the goldsmith declares it to be 24-carat gold. Four of them and the collar were purchased by the court or the Landstuba, and these pieces of antiquity will probably be offered to the government, for the Museum in Göttingen or for another public

- 61755 collection. The collar is broken in two, and it appears to have been hooked together on one side and attached to the other by two sliders (Schieber), which are still present.
- 61760 December 17, 1920 – In Westerkappeln (Westphalia), a clay vase containing 37 gold coins was found in a field during digging. The broken vase was carelessly discarded, but later, at the site where it was found, a ring with three stones and a worked piece of solid gold were found. The large, heavy coins are of Roman origin and represent an important numismatic asset.
- 61765 August 12, 2007, GOLD TREASURE FROM VELP APPEARS TO BE PARTLY IN MOSCOW!
The early medieval Velp Gold Treasure, looted from Berlin by the Red Army in 1945, is located in the Pushkin Museum in Moscow. This was reported by Jos Bazelmans, head of research at the Rijksdienst (National Service for the History of the Netherlands). for Archaeology, Cultural Landscapes and Monuments (RACM). He recently saw the treasure, excavated in 1851 and sold to Germany a few years later, prominently
- 61770 featured in the catalog of an exhibition on Merovingian art at the Moscow museum. The fact that this has only now become known is entirely due to a degree of political openness to the West by former President Vladimir Putin. The treasure now has two sides: archaeologically very interesting for the Netherlands, but also historically charged! This is also historically interesting because the reason the treasure is in
- 61775 Moscow relates to the outcome and history of World War II. The treasure was taken in crates from Berlin to Moscow by Russian troops in 1945, as one of the means of reparation for all the enormous damage the Germans had caused in Russia. Because the treasure was purchased by the Germans in the Netherlands at the time, the Netherlands will never be able to claim the objects. The Germans are negotiating with the
- 61780 Russians about restitution or, for example, the creation of replicas. This issue, even 65 years later, remains very sensitive. The Municipality of Rheden has already contacted the Pushkin Museum in Moscow, purely with the intention of updating each other on the current state of affairs. There are plans to send a Dutch research team to Moscow under German supervision for further investigation. More to come!
- 61785 Dutch archaeologists want to dig up the treasure and study the hoard, said Emeritus Professor of Archaeology Tjalling Waterbolk on Thursday, because it resembles other gold treasures from the Netherlands, such as the Beilen hoard he excavated in 1955. Bazelmans has asked the Ministry of Education, Culture and Science to arrange for a Dutch archaeologist to study the hoard in Moscow. The Velp hoard was originally
- 61790 larger and, in addition to these medals, also consisted of a large number of gold coins, bracelets, neck rings, and a gold chain. Only the coin jewelry has been preserved.
- 61795 THE VELP TREASURE; GISBERT CUPER, FRANKS AND ROMANS
Speaker: Drs. P. Beliën.
The hoard discovered in Velp in 1715 is one of the most spectacular treasure finds ever made in the Netherlands. The lecture will discuss the discovery of the hoard and what subsequently happened to the gold from the find. After this, we'll take a step back in time, to the beginning of the fifth century AD. This was the period when the
- 61800 treasure was entrusted to the earth. We'll try to answer the question of how the gold ended up in Velp and who owned it.
Gold objects have been found in two locations in Velp. The gold hoard, found at the former Villa den Heuvel, can be admired either partially or entirely in Moscow. A second find containing gold objects is said to have been sold to Paris. Nothing more
- 61805 is known about this. All in all, a very international treasure story!
- Germanic Necklaces
In 1916, four solid gold necklaces were discovered on the floodplains of the Gelderse IJssel near Olst. They were made around 400 AD from melted solidi. Solidi, the plural of the Latin solidus, are late Roman gold coins. Precious metal jewelry was highly
- 61810 valued in Germanic society. In the British epic Beowulf (8th century), the author speaks approvingly of the generosity of a king who showers the best warrior with royal gifts.
The Olst hoard is not unique; similar finds have been made elsewhere in the
- 61815 Netherlands. For example, in 1955, five gold neck rings and a bracelet were discovered in Beilen. This hoard also contained 22 coins. More than a century earlier, in 1850, a neck ring and a coin were already known from this site, but were subsequently lost. The Beilen neck rings are also thickened in the middle and bear typical Germanic decorative motifs. It has been calculated that more than one hundred

61820 solidi must have been melted down for the six pieces of jewelry from the Beilen hoard. The Beilen hoard is now on display at the Drents Museum in Assen. Other sites where such remarkable jewelry has been found are Rhenen, near the early medieval burial ground, and Velp. Part of the latter gold hoard, discovered in 1751, is in the National Museum of Antiquities: two medals, crafted into medallions, minted in Ravenna around 425. The Velp hoard was originally larger and, in addition to these medals, also consisted of a large number of gold coins, bracelets, neck rings, and a gold chain. Only the coin ornaments have been preserved.

61825 The gold hoards share the fact that they were buried at the end of the 4th century or the beginning of the 5th century. The reason for the burial of such valuables cannot be determined with certainty. In any case, these objects must have belonged to prominent Germanic chieftains who maintained contacts with the Roman Empire. They may have received the gold as a reward for services rendered to the Romans, such as participation in military operations. For example, the Germanic tribes who protected the Roman Empire's border from their own kind undoubtedly received generous payments, in gold. A centurion may also have received Roman gold in exchange for a promise not to engage in hostilities against the Romans.

61830 The great political unrest, internal strife, and invading plunderers during the period of the migrations may have led the owner to hide his treasures. Perhaps he himself participated in military expeditions and therefore had to find a safe hiding place for his valuables. Perhaps he was unable to unearth the hidden treasure afterward, for example, because he had been killed in action. If no other survivors were informed, the location of the treasure was forgotten

61835 Recently, another possible reason for burying such valuables has been suggested. The gold treasures may also have been used as offerings to appease the gods, or to gain their support in turbulent times. Splendid offerings of prestigious neck rings (symbols of worldly power) and other gold objects conferred prestige on the ??

61840 and whom the gods honored so princely. The gold treasures from the late 4th and early 5th centuries, found both north and south of the Rhine, certainly reflect the unstable political situation of this period. Moreover, these riches demonstrate the Romans' desire to defy the threat to their empire from external invasions through alliances. Quite a few gifts would have been necessary to improve relations with Germanic chieftains and maintain the alliances. Ultimately, it was to no avail, because in 406, Germanic tribes finally crossed the Rhine border, marking the end of Roman rule in the Netherlands.

Кулаков В.И.

Римские наградные гривны из Велпа (Нидерланды)

61860 В 2003 и 2005 гг. в рамках выполнения договора между Институтом археологии Российской академии наук и Государственным Музеем изобразительных искусств им. А.С. Пушкина автору этих строк выпала честь работать по теме «Научный анализ и каталогизация западно-европейских находок IV–VII вв. н.э. из собрания ГМИИ им. А.С. Пушкина».

61865 Необходимо отметить доброжелательную помощь, непременно оказывавшуюся мне в ходе этой непростой работы со стороны директора Государственного Музея изобразительных искусств им. А.С. Пушкина И.А. Антоновой, заведующего Отделом Искусства и археологии Древнего мира, хранителя коллекции В.П. Толстикова, а также помощника заведующего Отделом по хранительской работе, заведующего Сектором Античного искусства О.В. Тугушевой. Пользуюсь случаем высказать мою глубокую благодарность этим коллегам.

61870 В процессе разборки группы находок, ранее хранившийся в фондах Музея Древней и Ранней истории (Берлин, дворец Шарлоттенбург), а ныне находящихся в фондах ГМИИ им. А.С. Пушкина, моё внимание привлёк комплекс, состоящих из семи золотых гривен (Кулаков В.И., Толстиков В.П., 2007, с. 278, 279). Этот комплекс входил в состав клада, найденного в 1851 г. в южной части Нидерландов (провинция Гельдерланд), в историческом регионе Северный Брабант. Кроме гривен, в составе депозита обнаружены два перстня со щитками, спиральное кольцо и петля проволоочная, изготовленные из золота. Клад был случайно обнаружен во время сельскохозяйственных работ в саду в окрестностях селения Велп (Velp), которое расположено к востоку от города Арнхайм (Arnhem), при впадении реки Ййссель (IJssel) в один из рукавов дельты р. Рейн – в Недер Рийн (Nederriijn = голл. «Нижний Рейн»), на правом берегу последнего (рис. 1). Гривны были проданы находчиком (?) и оказались на рынке художественных произведений (антикварном ?) в г. Лейдене. Там они в 1852 г. были приобретены для Королевского музея в Берлине (ныне – Музей Древней и Ранней истории) (Менгин В., 2007, с. 42 и

61875

61885

- опубликованы в Нидерландах (Janssen, 1852, p. 161-180). Типологическая принадлежность находки (инвентарь погребения или клад) долгие десятилетия оставались не ясными. Известно лишь, что в начале весны 1945 г. этот комплекс вместе с остальными более чем 700 золотыми музейными экспонатами был депонирован в бункере (третий этаж 7-этажного комплекса противозвоздушной обороны Люфтваффе – Fleckturm «Zoobunker») в районе Берлинского зоопарка и 4 мая того же года передан представителям Красной Армии (Bertram M., 1995, S. 16). Оказавшийся в английской зоне оккупации Берлина Fleckturm Zoobunker представители Великобритании позднее получили уже без музейных экспонатов.
- Информация, связанная с комплексом гривен из Велпа, интересна и заслуживает специального рассмотрения ввиду уникальности упомянутых музейных экспонатов (рис. 2). В европейской археологии известны золотые шейные украшения (die Halsringe), именуемые «гривны типа Велп» и происходящие из:
2. (здесь и далее – №№ по карте на рис. 2). Ниймеген, Нидерланды (Nijmegen, Holland) – фасетированная гривна со штемпельным орнаментом;
 3. Ренен, Нидерланды (Rhenen, Holland) – 2 фасетированные гривны весом 85 и 55 г со штемпельным орнаментом, одна из гривен имеет пластину со вставками из гранатов (?), фрагмент плоской гривны с надписью «ER.E.F(ecit)V(uncial=136,44 г)Proclu(s) (Roes A., 1947, p. 186);
 4. Ольст, Нидерланды (Olst, Holland) – 4 фасетированные гривны (die Facettenhalsringe), три из которых имеют штемпельный орнамент, их вес достигает 22 карата золота;
 5. Байлен, Нидерланды (Beilen, Holland) – 4 фасетированные гривны со штемпельным орнаментом, гривна из 8-гранного дрота, свёрнутая до размера браслета, 1 фасетированный браслет со штемпельным орнаментом, вес гривен – 43,2 г, 66,9 г, 67,8 г, 80,8 г, 93,4 г, всего их вес составляет 100 солидов из расчёта веса одного позднеримского солида 4,55 г), в составе клада – 23 солида (?) эпохи правления Гонориуса и другие римские монеты;
 6. Ёстрих-Летмате, Германия (Ostrich-Letmathe, Deutschland) – фасетированная гривна со штемпельным орнаментом, браслет из дрота с круглым сечением, с расширяющимися концами и со штемпельным орнаментом;
 7. Вестеркаппель, Германия (Westerkappeln, Kr. Tecklenburg, Deutschland) – фасетированный браслет со штемпельным орнаментом, римские монеты, чеканенные в 337–378 гг. н.э.
- Все перечисленные выше гривны в западноевропейской археологии принято считать происходящими из единой мастерской (оттиски штемпелей их декора вполне идентичны). Гривны считаются ранговыми знаками вождей германских дружин конца IV – начала V в. или его первой половины, сопутствующие гривнам в кладах монеты интерпретируются как римский donatium/stipendium германским наёмникам («цена крови»). Клады с гривнами типа Велп трактуются как жертвы богам отдельных германских племён (указаны на рис. 1) низовий Рейна (Steuer H., 2006, S. 120-123).
- Используя представившуюся возможность непосредственного осмотра и фиксации гривен из Велпа был создан каталог этих находок. В нём гривны выступают под номерами фондового хранения в ГМИИ им. А.С. Пушкина (далее – ГМИИ). Номера хранения в фондах Музея До- и Протоистории (Берлин) даны в скобках.

Каталог гривен из Велпа

- Аар 1479 (II 3694) – гривна золотая (проба 800°), разм. 14,9x14,1 см, вес 41,52 г (9 солидов), изготовлена из дрота, имеет застёжку в виде крючка и 8-видной петли. Петля спаяна из гнутого конца дрота гривны. В тыльной части дрот гривны имеет диам. 1,9 мм, в лицевой части – 3,1 мм. Сечение дрота по всему периметру гривны круглое, в пределах петли застёжки – миндалевидное. Эта гривна, как и остальные предметы из комплекса, найденного у пос. Велп, имеет дрот волнистых очертаний. Это – результат распрямления дрота, поступившего в 1945 г. в ГМИИ смятым. На рисунке в первой публикации этой гривны она имеет уплощённо-овальную форму (рис. 2,8). Однако искривлённость дрота гривны видна и на этом рисунке. Соответственно, гривны были найдены смятыми, что прямо указывает на характер комплекса – клад, компоненты которого были смяты для большей компактности клада и удобства его сокрытия.
- Аар 1478 (II 3689) – гривна золотая (проба 750°), разм. 17,5x14,4 см, вес 76,77 г (17 солидов), является имитацией гривен и браслетов типа «с расширенными концами». Эти концы у этой и последующих гривен из Велпа не разделены. Гривны надевались так, чтобы их широкая уплощённая часть (в сечении имела вид весьма плоского треугольника с усечённой вершиной) находилась на груди их хозяина. Тыльная половина обода гривны имеет вид дрота. Он ещё на уровне восковой литейной модели был уплощён на лицевой стороне и приобрёл видимость соединённых расширенных концов гривны. Гривна украшена оттисками штампа (чекана). Гривна Аар 1478 – единственная из гривен клада в Велпе, расширенная часть которой покрыта оттисками 4 различных видов штампов (рис. 3)

- целиком, что находит полную аналогию в гривне из Ренен (Rhenen). Гривна имеет форму ассиметричного, вытянутого вправо овала.
- 61955 Аар 1477 (II 3692) – гривна золотая (проба 800°), разм. 19,2x15,7 см, вес 57,32 г (12,6 солидов), однотипна гривне Аар 1478. Гривна Аар 1477 – единственная из гривен из Велпа, имеющая особую композицию декора. Она состоит из поперечных линий чеканного орнамента, вытянутых горизонтально вправо и влево от центра широкой лицевой части гривны. Линии оттисков штампа завершаются стреловидными фигурами (рис. 3, 4). Гривна,
- 61960 как и остальные гривны из Велпа, имеет застёжку в виде крючка и 8-видной паяной петли.
- Аар 1474 (II 3690) – гривна золотая (проба 800°), разм. 18,8x13,6 см, вес 58,05 г (13,8 солидов), однотипна гривне Аар 1478. Эта и последующие гривны декорированы стандартно при помощи ромбоидальной композиции, образованной оттисками различных
- 61965 штампов и разделённой полосой из оттисков полукруглых и угольчатых штампов (рис. 2, 3). На пограничных участках при переходе с дрота к пластине гривны её плоскость украшена локальной группой оттисков штампов.
- Аар 1475 (II 3693) – гривна золотая (проба 800°), разм. 24,3x16,7 см, вес 85,43 г (18,8 солидов), однотипна гривне Аар 1478, по орнаменту – аналогична Аар 1474. На
- 61970 пограничных участках при переходе с дрота к пластине гривны её плоскость украшена локальной группой оттисков штампов.
- Аар 1476 (II 3691) – гривна золотая (проба 800°), разм. 18,8x14,4 см, вес 70,25 г (15,4 солида), однотипна гривне Аар 1478, по орнаменту – аналогична Аар 1474.
- Аар 1473 (II 3688) – гривна золотая (проба 800°), разм. 24,3x16,7 см, вес 73,73 г (16
- 61975 солидов), однотипна гривне Аар 1478, по орнаменту – аналогична Аар 1474. На пограничных участках при переходе с дрота к пластине гривны её плоскость украшена локальной группой оттисков штампов.
- Типологизация гривен из Велпа усложнена редкими для *Barbaricum* видами их формы и орнамента. В кладах, представленных на рис. 1, обнаружены сходные гривны и браслеты, изготовленные из золота. При этом гривна из Ёстрих по орнаменту и параметрам является типологически полной аналогией шейным украшениям из Велп (Аар 1474, Аар 1475, Аар 1476, Аар 1473). Браслет из Ёстрих имеет в своей лицевой части реальные, а не мнимые
- 61980 (как на гривнах) утолщения, украшенные чеканным орнаментом типа гривен из Велпа (Radig W., 1939, S. 109, Abb. 108).
- Дротовая гривна Аар 1479 вполне типична для различных германских и балтских древностей второй четверти I тысячелетия н.э. К сожалению, именно эта типичность не позволяет осуществить точную культурно-этническую идентификацию этого предмета. Ясно лишь, что, обладая самыми малыми среди гривен из Велпа размерами (14,9x14,1 см), эта
- 61990 гривна непосредственно примыкала к шее своего хозяина. Судя по стёртости (скорее – полировки) ношение гривны Аар 1479 было долговременным. Кстати, этого нельзя сказать о других гривнах из клада в Велпе. Все они, в особенности гривна Аар 1478, не несут значительных следов употребления. Края лицевых пластин гривен настолько остры, что о них можно порезаться. При этом эти края в ряде мест несут следы механических
- 61995 воздействий (поперечные вмятины), являющиеся, скорее всего, следствием сминания гривен при их депонировании.
- Особенности формы лицевой части гривен (рис. 3, 4) позволяет полагать в данном случае имитацию гривен и браслетов с расширенными концами. Такие детали убора (браслеты типа Kolbenring, поздний вариант – тип Szentendre) являлись у членов древнегерманского «героического общества» символами власти «варварских» principes III-VI вв. н.э. (Lund Hansen U., 1998, S. 348). Также они могли отмечать членов семей из состава «варварской» аристократии.
- Несмотря на то, что гривны из Велпа имитируют детали «варварского» убора, особенности их формы и декора, приёмы изготовления гривен (следы волочения дрота, аккуратная
- 62000 расковка лицевых частей гривен, разнообразные формы штампов, чётко выдержанные орнаментальные композиции) позволяют уверенно причислять их к продукции провинциально-римских мастеров. Указание на типологическую принадлежность уникальных гривен (включая дротовую) из Велпа содержится в особой 8-видной форме петель их застёжек. Доказано, что гривны такими петлями появляются на рейнском лимесе Империи
- 62010 около середины III в. н.э. (Stjernquist B. 1955. p. 137) и являются прототипами для шейных украшений с так называемыми «грушевидными» замками.
- Особый интерес вызывает декор гривен из Велпа. Он представлен композициями из оттисков круглых, полукруглых и треугольных штампов. В старой немецкой историографии они относятся к декору типа eingestempelte Ornamente, нанесённому одиночными
- 62015 пуансонами (рис. 5, №№ 1-4, 6, 7, 17 и 18 в нижней части рисунка). Как правило, они характерны для скандинавских древностей ранней фазы эпохи Великого переселения народов. На север Европы они поступили непосредственно из римских провинций. Показательно, что для прусского материала стиля Sosdala, позднего относительно

- скандинавских пуансонных декоров, упомянутые формы штампов не характерны (Aberg N., 1919, 47, 49). В исторической Пруссии орнамент стиля Sosdala существует на фазах C2/D2 (возможно – с фазы D1), на Неманском правобережье – на фазах C2/D1. В эти регионы Балтии обычай наносить такой декор на металлические детали воинского убора принесли с собой вернувшиеся на родину (?) ветераны (пешие воины-ауксиларии и кавалеристы), служившие в римских войсках на рейнском или на дунайском лимесе
- 62025 (Кулаков В.И., 2006, с. 64, 65). Клад из Велпа обнаружен как раз в одном из районов эвентуальной дислокации этих «варварских» подразделений на службе Рима. К сожалению, на закате Империи иными войсками она уже не располагала. Поэтому, в частности, ясно, почему форма гривен из Велп ориентируется на образцы престижных германских украшений, характерных
- 62030 исключительно для «варварской» дружинной элиты. Гривны из Велпа не обладают орнаментов в стиле Sosdala, типичными для которого являются звёздные композиции. Зато на одной из этих гривен представлен оттиск миндалевидного штампа со слабым углублением в центре (рис. 4, Aар 1478, по краям каждого из оттисков треугольного штампа). Аналог этого штампа представлен на пряжке из Бриже (Briza, Bez. Litomerice) в Чехии (Tejral J., 2001, S. 40), типичной для древностей горизонта Унтерзибенбрунн (Untersiebenbrunn), относимых в Центральной Европе к фазе D2 (ок. 380/400–ок. 440/450 гг. н.э.) (Kazanski M., Koch U., 2001, S. 85). Такие углубления создавали эффект плоского рельефа у изображений, на самом деле
- 62040 изготовленных гравировкой, акцентированной точечным штампом. Этот орнаментальный приём, представленный, в частности, на обломке серебряного блюда из клада В в Млотечно (тип Eggers 115), появляется, судя по этой находке, ещё на фазе B1 (Кулаков В.И., 1998, с. 99) и являются древнейшим предшественником декора гривен из Велпа и, соответственно, орнамента стиля Untersiebenbrunn.
- 62045 Отсутствие следов деградации орнамента на гривнах из Велпа позволяют датировать их началом этого горизонта. Не исключено, что орнамент на гривнах – своеобразная предтеча декора стиля Untersiebenbrunn. В целом приведённые аргументы позволяют предварительно отнести гривны из Велпа ко времени ок. 370–400 гг. н.э. Само происхождение декора Untersiebenbrunn чрезвычайно интересно и нуждается в развёрнутом искусствоведческом анализе. Пока можно предполагать, что этот тип
- 62050 орнамента является финальной формой развития декора деталей провинциально-римского воинского снаряжения и должен находится в конце типологического ряда, начатого в эпоху Юлиев–Клавдиев декором в стиле Opus interrasile, продолженном в эпоху «солдатских» императоров уплощённым рельефом, углублённые части которого со временем теряли свою глубину. В конечном итоге утратившие навыки своих предшественников, мастера эпохи заката Империи, слабо помнив о необходимости изготовления на своих
- 62055 изделий неких углублённых частей, стали имитировать их скоплениями различных штампов. Издавна изделия с таким декором (стиль Untersiebenbrunn) производили впечатление предметов со стёртыми, еле видными остатками рельефных изображений. Мода на протяжении веков (в том числе – современная) даёт серию примеров сходной утраты первоначального смысла декора или же предмета убора при его долговременном
- 62060 изготовлении (превращение цилиндра в кепи, мутация джинсов как рабочей одежды в бессмысленно затёртый аксессуар «от кутюр»).
- 62065 Если вопросы типологии и хронологии гривен из Велпа решаемы с привлечением сходных по признакам предметов материальной культуры Barbaricum конца IV в. н.э., то семантическое значение этих предметов можно раскрыть лишь с привлечением сугубо римских аналогий, причём – довольно ранних.
- Перед выяснением семантики интересующих нас гривен следует попытаться установить принципы их ношения. Вотивный характер этих гривен явно исключается, ибо со времени Миланского эдикта (313 г. н.э.), проведения Никейского собора (325 г.) и неудачной попытки воссоздания отеческих культов при Императоре Юлиане «Отступнике» (355–363 гг. н.э.) христианская религия стала господствующей в Империи. Принесение драгоценных даров римским богам в конце IV в. н.э. уже не было возможно.
- 62070 Слабые следы стёртости присутствуют почти у всех гривен (кроме Аар 1479 и Аар 1478) в верхней части расширения в центре их лицевой стороны. Можно предполагать факт ношение всех этих гривен одновременно, причём так, что гривны с меньшим диаметром находились поверх гривен с большим диаметром и, соответственно, частично их перекрывали. В соответствии с этим принципом проведена реконструкция схемы ношения комплекса гривен из Велпа (порядок гривен показан на рис. 6). В этом комплексе своими крупными
- 62080 параметрами выделяются две нижние гривны – Аар 1475 и Аар 1476. Они явно рассчитаны для расположения на предплечье. Остальные гривны, обладающие математически убывающими параметрами, составляют в схеме ношения некую цилиндрическую фигуру. Иными словами, эти гривны покрывали собственно шею своего хозяина. Пространство, образовавшееся между тыльными частями трёх нижних гривен и четырёх верхних гривен (рис. 6), могло

- 62085 быть заполнено, например, шейным платком. Эта неременная деталь убора римского легионера могла выгодно оттенять сияние золота гривен и оберегать шею их хозяина от натирания острыми гранями гривен. Несмотря на внушительный вид всего комплекса гривен, их ношение всех вместе ввиду их незначительного веса, было вполне достижимым. Упомянутый выше феномен возрастания параметров гривен в значительной мере дублируется их весовыми значениями в следующей последовательности, реализованной в характерной для римского времени мере веса, использовавшейся при ювелирных работах – в скрупулах (1,137 г):
- 62095 Перед выяснением семантики интересующих нас гривен следует попытаться установить принципы их ношения. Вотивный характер этих гривен явно исключается, ибо со времени Миланского эдикта (313 г. н.э.), проведения Никейского собора (325 г.) и неудачной попытки воссоздания отеческих культов при Императоре Юлиане «Отступнике» (355–363 гг. н.э.) христианская религия стала господствующей в Империи. Принесение драгоценных даров римским богам в конце IV в. н.э. уже не было возможно.
- 62100 Слабые следы стёртости присутствуют почти у всех гривен (кроме Аар 1479 и Аар 1478) в верхней части расширения в центре их лицевой стороны. Можно предполагать факт ношение всех этих гривен одновременно, причём так, что гривны с меньшим диаметром находились поверх гривен с большим диаметром и, соответственно, частично их перекрывали. В соответствии с этим принципом проведена реконструкция схемы ношения комплекса
- 62105 гривен из Велпа (порядок гривен показан на рис. 6). В этом комплексе своими крупными параметрами выделяются две нижние гривны – Аар 1475 и Аар 1476. Они явно рассчитаны для расположения на предплечье. Остальные гривны, обладающие математически убывающими параметрами, составляют в схеме ношения некую цилиндрическую фигуру. Иными словами, эти гривны покрывали собственно шею своего хозяина. Пространство, образовавшееся
- 62110 между тыльными частями трёх нижних гривен и четырёхверхних гривен (рис. 6), могло быть заполнено, например, шейным платком. Эта неременная деталь убора римского легионера могла выгодно оттенять сияние золота гривен и оберегать шею их хозяина от натирания острыми гранями гривен. Несмотря на внушительный вид всего комплекса гривен, их ношение всех вместе ввиду их незначительного веса, было вполне достижимым. Упомянутый выше феномен возрастания параметров гривен в значительной мере дублируется их весовыми значениями в следующей последовательности, реализованной в характерной для римского времени мере веса, использовавшейся при ювелирных работах – в скрупулах (1,137 г):
- 62120 Аар 1479 – 36,52 скрупул
Аар 1477 – 50,41 скрупул
Аар 1474 – 51,05 скрупул
Аар 1476 – 61,78 скрупул
Аар 1473 – 64,84 скрупул
Аар 1478 – 67,84 скрупул
62125 Аар 1475 – 75,13 скрупул
- 62130 Разумеется, не полностью кратные значения веса гривен в римской весовой системе зависит как от возможных ошибок изготовителей этих предметов, так и от микроскопических утрат (царапин, трещин и проч.), со временем искаживших заданный в древности вес гривен. Однако более наглядно выглядит весовая стопа, разделяющая гривны:
- Между Аар 1477 и Аар 1474 – 0,64 скрупул, то есть 1/40 унции (в унции – 24 скрупулы)
Между Аар 1474 и Аар 1476 – 10,73 скрупул, то есть 1/5 унции
Между Аар 1476 и Аар 1473 – 3,06 скрупулы, то есть 1/12 унции
62135 Между Аар 1473 и Аар 1478 – 2,68 скрупулы, то есть примерно 1/12 унции
Между Аар 1478 и Аар 1475 – 7,6 скрупул, то есть 1/6 унции
- Если между указанными выше гривнами видна довольно чёткая римская двенадцатеричная стопа, то дротовая гривна Аар 1479 весит в римской весовой системе 36,52 скрупул и не обладает кратным различием (стопой) ни с одной из остальных гривен комплекса. Это прямо свидетельствует об изготовлении этих гривен в мастерской, в которой работали мастера, неукоснительно придерживавшиеся римской весовой системы. Напротив, творец дротовой гривны Аар 1479 (вес – 9 солидов) указанной системы не придерживался и ориентировался на более грубую весовую стопу солидов, популярную в Barbaricum. Не столь чётко выглядят золотые пробы гривен, исчисляемые в основном значением 800°.
- 62140 Лишь самая крупная, с лицевой стороны орнаментированная полностью гривна Аар 1478 имеет золотую пробу 750°.
- 62145 Интересно сравнение последовательности гривен по нарастанию их метрических и весовых параметров. Их динамика в целом совпадает в следующем виде:
- | | |
|---------------------------------------|-----------------------------------|
| По возрастанию метрических параметров | По возрастанию весовых параметров |
| 62150 Аар 1478 | Аар 1474 |

	Aар 1477	Aар 1473
	Aар 1477	Aар 1476
	Aар 1474	Aар 1478
	Aар 1473	Aар 1475
62155	Aар 1476	Aар 1475
- Важен вопрос поло-возрастной и социальной принадлежности хозяина гривен из Велпа. Обычай ношения гривен как украшения шеи римлянами и римлянками не только не использовался на всём протяжении римской истории, но и считался для них чуждым. Не следует забывать о том, что носители традиции использования гривен (лат. *torques*) кельты, позднее – германцы, являлись традиционными противниками Рима.
- Тем не менее (скорее – благодаря этому атрибуту «варваров», воспринимавшемуся римлянами как трофей – Махлаук А.В., 2006, с. 328) в римской армии гривны наряду с браслетами и фалерами (нагрудные бляхи) в начале нашей эры стали знаками отличия для рядовых легионеров. Уже в эпоху Августа на надгробии центуриона первой когорты XVIII легиона Марка Целия, погибшего в 9 г. н.э. в битве в Тевтобургском лесу и похороненного у Ксанта (Нидерланды), видны наградные браслеты (рис. 7), привязанные тканевыми жгутами к наплечным пластинам панциря. Шею центуриона украшала наградная витая (тордированная ?) гривна. Если в эпоху ранней Империи наградные гривны крепились замками на тыльной части шеи, то в середине – второй половине IV в. н.э. такие шейные награды на своей лицевой части имеют утолщения, имитирующие расширенные концы гривны. Они украшают шеи телохранителей (лат. *singularis*) Императоров Констанция II (рис. 8) и Феодосия I Великого (рис. 9), представленных на серебряных блюдах, хранящихся в музеях Санкт-Петербурга и Мадрида. Кстати, именно императоры единолично могли вручать (видимо – и утверждать) награды не только «офицерам», но и рядовым солдатам (лат. *caligae*) легионов (Махлаук А.В., 2006, с. 324). Такие гривны застёгивались на тыльной стороне шеи воина (рис. 5,1). Точно так же устроены и гривны из Велпа. Очевидно, этот принцип использовался и в ранней Византии, наследовавшей часть римских воинских обычаев. Правда, в эпоху Юстиниана I Великого его телохранители, судя по мозаике из базилики Сан Витале в Равенне, носили гривны с медальонами на лицевой стороне. При этом медальоны либо украшались вставками камней, либо декорировались эмалью. Пример таких гривен имеется в кладе в Ренен.
- Обнаруженная на оборотной стороне этой плоской детали гривны подчёркивает важность её весового значения, соответствующего, очевидно, приказу о данной награде. Таким образом, типологическая линия развития римских наградных гривен-*torques* в первой половине VI в. Прерывается.
- Уже с эпохи Принципата в римской армии существует традиция множественных награждений – *dona militaria*. Фалеры вручались отличившимся в бою легионерам в комплексе из 6-и и более металлических или даже стеклянных блях, соединённых ремнями для крепления на груди воина (на доспехах). Гривны при награждении сопровождалась браслетами (рис. 10,2). В нашем случае процесс сложения комплекса наградных гривен можно попытаться реконструировать следующим образом. Воин, обладавший своей персональной дротовой гривной, указывающей на его «варварское» (возможно – германское) происхождение, за некий подвиг был награждён одиночной гривной Аар 1478. Её лицевая пластина полностью покрыта чеканным орнаментом. Неорнаментированными остались боковые и тыльная дротовые части гривны, скрывавшиеся плащом. Далее происходит следующее награждение, также – одиночной гривной Аар 1478 (рис. 3). Правда, мастер, видимо, осведомлённый о вторичности этой награды, украшает на этой гривне лишь часть лицевой стороны. Остальная поверхность её лицевой пластины частично скрыта более ранним награждением – гривной Аар 1478 и не нуждается в декорировании. С таким же принципом экономии своей работы этот же (или другой ?) мастер подошёл к третьей, уже множественной награде – четырём гривнам Аар 1473, Аар 1474, Аар 1476 и Аар 1475. Прямой связи между весами этих гривен в виде стопы скрупул не отмечается (см. выше). Упомянутые четыре гривны стереотипно снабжены симметричными сериями треугольных композиций из оттисков штампов в центральной части лицевой пластины гривны. Это третье награждение, выделяемое эвентуально и характерное для воинских традиций Рима (Колобов А.В., 1999, с. 67), могло стать для воина последним воздаянием за его подвиги во славу Рима. Учитывая находки аналогичных гривен в Ёстрих и в других пунктах бассейна Нижнего Рейна, можно выдвинуть предположение о существовании в конце IV в. н.э. на рейнском лимесе стандартных золотых наградных гривен.
- Ввиду некоей внезапной ситуации или сам воин депонировал свои награды вместе с персональной гривной, или (что предпочтительней) некий противник Рима, повергнув в схватке этого героя, сорвал с него и *dona militaria*, и личную гривну, сокрыв это уже на правом, германском берегу р. Рейна. Вместе с этими предметами, соединявшимися, очевидно, петлёй из обрывка золотого дрота (рис. 2,6), оказались в земле и золотых два перстня со щитками. Эти предметы римского ювелирного искусства (на щитке одного

из перстней – профильное изображение Императора /?/ – рис. 2,7) могли также входить в состав инвентаря безвестного римского воина. Трактовать эти перстни в качестве наград (как и явно «варварский» спиральный перстень – рис. 2,5) не представляется возможным.

62220 Ещё со времён Юлия Цезаря враги стремились позастыдиться у поверженного легионера его ценные и по материалу, и по общественному статусу награды (Кован Р., 2005, с. 28, 29). Отметим, что и в последующих войнах, включая Вторую Мировую войну, солдаты многих европейских армий проявляли особое внимание к наградам врага, считая их престижными трофеями и первым делом пополняя им свои вешки и ранцы. Такие трофеи на

62225 рубеже IV–V вв. при прорыве рейнского лимеса попали в руки воинов различных племён и осели в земле на их родине (рис. 1).

Как уже отмечалось выше, уникальная форма гривен из Велпа не позволяет найти им близкую аналогию в римском и «варварском» археологическом материале позднеантичного

62230 времени. Это является результатом чрезвычайной редкости находок римских наградных гривен, которые весьма высоко ценились как их обладателями, так и врагами Рима. Автору этих строк известна лишь одна из немногих находок сходной *dona militaria*. Это – фрагмент гривны из Карнунтума на дунайском лимесе. Гривна представляла собой фрагмент кольцевидно изогнутой пластины, заканчивавшейся грушевидной в плане застёжкой. На этой пластине ещё на стадии создания восковой матрицы была нанесена рельефная латинская надпись, от которой сохранился лишь фрагмент «*felices Tungri*...». Возможно, полностью надпись должна выглядеть как «*felices Tungri*» и упоминать

62235 представителя германского племени тунгров (совр. Бельгия), составлявших во II–III вв. н.э. I пограничную алу тунгров в провинции Дакия (Roes A., 1947, p. 181). На внутренней стороне гривны слабо видно руническое (?) граффити (Beninger E., 1934, Taf. 300,6). Как гривны типа Велп, так и гривна из Карнунтума – плоские, но производят впечатление массивных предметов и при этом не обременительны при их ношении.

Итак, ясна принадлежность гривен типа Велп – *dona militaria*. В современном

62245 антиковедении сложилось мнение о том, что «в эпоху Антонинов (II в.) начинается вытеснение *dona militaria*, включая браслеты и ожерелья (= гривны – К.В.), чисто материальными методами стимулирования отличившихся воинов...» (Колобов А.В., 1999, с. 71). В позднем Риме, кроме того, наградами служили золотые медальоны с надписями, возмечивавшими подвиги защитников Империи (Махлаук А.В., 2006, с. 331). Находки из

62250 Велпа показывают факт существования во всяком случае одной из разновидностей *dona militaria* – гривен-*torques* в эпоху битвы при Адрианополе. Памятники искусства V–VI вв. содержат изображения наградных (статусных ?) гривен у имперских воинов развитой фазы эпохи Великого переселения народов. Длинные волосы у телохранителей Феодосия I Великого и Юстиниана I Великого (традиция древнегерманских дружинников-*capillati*)

62255 справедливо позволили трактовать их как германцев (Fuchs S., 1943, S. 150). Ношение ими (тем более – в присутствии Императора) гривен указывает на то, что они не исполняют здесь роль языческих по происхождению украшений, а являются знаками отличия воинов, своей храбростью завоевавших право составлять ближнее окружение Императора. Мнение о культурно-этнической и социальной принадлежности гривен из Велпа недавно

62260 высказано директором Музея Древней и Ранней истории (Берлин) Проф. Др. Вильфридом Менгином. Он считает, «... что клад из Фельпа принадлежал одному из франкских вождей, взявших на себя со второй половины IV в. в качестве федератов Рима границ Империи на участке между Маасом и Шельдой» (Менгин В., 2007, с. 42). Приведённая выше серия доказательств свидетельствует, напротив, о том, что:

62265 1. Гривны из Велпа изготовлены в конце IV в. н.э. провинциально-римскими мастерами.
2. Эти предметы являются не украшениями и, тем более, не статусными аксессуарами статусного/сакрального достояния «варварских» королей, а являются римскими воинскими наградами *dona militaria*.

62270 3. Гривны из Велпа по статусу относятся к наградам, традиционно выдававшимся в римских легионах воинам рядового состава (*caliga*), в эпоху битвы при Адрианополе набиравшихся преимущественно из «варваров». Члены командного состава легионов, к которому мог принадлежать в легионах некий франкский король (по версии В. Менгина), в позднеимперское время представлялись к награждениям почётными знамёнами и копьями

62275 (*vexilla et hastae*) (Махлаук А.В., 2006, с. 329). Таким образом, становится явной ошибочность выводов о принадлежности гривен из Велпа, сделанных берлинским коллегой, специалистом по двулезвийным мечам эпохи раннего средневековья.

Местоположение клада гривен из Велпа соответствует северной части рейнского лимеса

62280 (рис. 1). 31 декабря 406 г. Галлия впервые подверглась с востока мощному наступлению «варваров», среди которых были представители племён гуннов, вандалов, аланов, свевов и бургундов (Perin P., Feffer L-Ch., 1987, p. 80). Это нашествие, для многих из его

участников ставшее последней битвой, могло не миновать и одного из воинов рейнского лимеса, охранявшего в составе одной из ауксилиев или же отряда воинов-limitanei
 62285 неспокойную имперскую границу. Этот воин (скорее всего – военачальник) пал на защите римских рубежей, его награды и перстни стали добычей некоего германского «варваров», поместившего свои трофеи в землю поблизости от места битвы на лимесе, скорее всего, в жертву отеческим богам. Менее чем через столетие, в начале эпохи правления конунга Хлодвиг (в 481 или 482 гг.) данный участок бывшей имперской территории будет
 62290 окончательно оккупирован франками (Perin P., 1995, p. 252).

- 62380 V.I. Kulakov.

Roman Award Torques from Velp (Netherlands)

- 62385 In 2003 and 2005, as part of an agreement between the Institute of Archaeology of the Russian Academy of Sciences and the A.S. Pushkin State Museum of Fine Arts, this author had the privilege of working on the topic "Scientific Analysis and Cataloging of Western European Finds from the 4th-7th Centuries AD from the Collection of the A.S. Pushkin State Museum of Fine Arts."

- 62390 I would like to acknowledge the generous assistance I received throughout this challenging work from I.A. Antonova, Director of the A.S. Pushkin State Museum of Fine Arts; V.P. Tolstikov, Head of the Department of Ancient Art and Archaeology and Curator of the Collection; and O.V. Tugusheva, Assistant Head of the Department for Custody and Head of the Sector of Ancient Art. I take this opportunity to express my deep gratitude to these colleagues.

- 62395 While sorting through a group of finds previously housed in the collections of the Museum of Ancient and Early History (Berlin, Charlottenburg Palace) and now housed in the collections of the Pushkin State Museum of Fine Arts, my attention was drawn to a complex of seven gold grivnas (V.I. Kulakov, V.P. Tolstikov, 2007, pp. 278, 279). This complex was part of a hoard discovered in 1851 in the southern Netherlands (province of Gelderland), in the historical region of North Brabant. In addition to
- 62400 the grivnas, the deposit also included two rings with shields, a spiral ring, and a wire loop, all made of gold. The treasure was discovered by chance during agricultural work in a garden near the village of Velp, which is located east of the city of Arnhem, at the confluence of the IJssel River with one of the branches of the Rhine delta - the Nederrijn (Dutch: "Lower Rhine"), on the right bank of the latter

- 62405 (Fig. 1). The torcs were sold by the finder (?) and ended up on the art (antique) market in Leiden. There, in 1852, they were acquired for the Royal Museum in Berlin (now the Museum of Ancient and Early History) (Mengin V., 2007, p. 42) and published in the Netherlands (Janssen, 1852, pp. 161-180). The typological affiliation of the find (burial inventory or treasure) remained unclear for many decades. It is only

- 62410 known that in the early spring of 1945, this complex, along with more than 700 other gold museum exhibits, was deposited in a bunker (the third floor of the 7-story Luftwaffe anti-aircraft defense complex - Fleckturm "Zoobunker") in the area of the Berlin Zoo and on May 4 of the same year was handed over to representatives of the Red Army (Bertram M., 1995, p. 16). Fleckturm, which ended up in the British
- 62415 occupation zone of Berlin was later the UK representatives received the Zoobunker without the museum exhibits.

- The information related to the Velp torc complex is interesting and deserves special consideration given the uniqueness of the aforementioned museum exhibits (Fig. 2). European archaeology is aware of gold neck ornaments (die Halsringe), referred to as
- 62420 "Velp-type torcs," originating from:

2. (hereinafter, numbers according to the map in Fig. 2). Nijmegen, Netherlands (Nijmegen, Holland) - a faceted torc with a stamp ornament;

3. Rhenen, Netherlands (Rhenen, Holland) - two faceted torcs weighing 85 and 55 g with a stamp ornament; one of the torcs has a plate with garnet inserts (?), a

- 62425 fragment of a flat torc with the inscription "ER.E.F(ecit)V(uncial=136.44 g)Proclu(s)" (Roes A., 1947, p. 186);
4. Olst, Netherlands (Olst, Holland) - 4 faceted torcs (die Facettenhalsringe), three of which have a stamp ornament, their weight reaches 22 karat gold;
5. Beilen, Netherlands (Beilen, Holland) - 4 faceted torcs with a stamp ornament, a
- 62430 torc made of an octagonal dart, rolled to the size of a bracelet, 1 faceted bracelet with a stamp ornament, the weight of the torcs is 43.2 g, 66.9 g, 67.8 g, 80.8 g, 93.4 g, their total weight is 100 solidi (based on the weight of one late Roman solidus of 4.55 g), the hoard contains 23 solidi (?) from the reign of Honorius and other Roman coins;
- 62435 6. Ostrich-Letmathe, Germany (Ostrich-Letmathe, Germany) - a faceted torc with a stamped ornament, a bracelet made of round wire with flared ends and a stamped ornament;
7. Westerkappeln, Germany (Westerkappeln, Kr. Tecklenburg, Germany) - a faceted
- 62440 bracelet with a stamped ornament, Roman coins minted in 337-378 AD.
- All of the above-mentioned torcs are generally considered by Western European archaeologists to have originated from a single workshop (the stamp impressions of their decoration are quite identical). Torcs are considered to be rank insignia of Germanic warlords of the late 4th - early 5th centuries or the first half of the 5th
- 62445 century; coins found in hoards accompanying torcs are interpreted as Roman donatium/stipendiums for Germanic mercenaries ("blood price"). The hoards of torcs of the Velp type are interpreted as offerings to the gods of individual Germanic tribes (shown in Fig. 1) of the lower Rhine (Steuer H., 2006, pp. 120-123).
- Using the opportunity to directly examine and record the torcs from Velp, a catalog
- 62450 of these finds was created. The torcs are listed under their storage numbers in the Pushkin State Museum of Fine Arts (hereinafter referred to as the Pushkin State Museum of Fine Arts). Storage numbers in the collections of the Museum of Pre- and Protohistory (Berlin) are given in parentheses.
- 62455 **Catalogue of Velp Torcs**
- Aar 1479 (II 3694) - gold torc (800° fineness), dimensions 14.9x14.1 cm, weight 41.52 g (9 solidi), made of wire, with a hook-and-eye clasp. The loop is soldered from the bent end of the torc's wire. The diameter of the wire on the back is 1.9 mm, and on
- 62460 the front - 3.1 mm. The wire is round around the entire perimeter of the torc, and almond-shaped within the clasp loop. This torc, like other items from the assemblage found near the village of Velp, has a wavy shaft. This is the result of straightening the shaft, which arrived at the Pushkin Museum in a crumpled state in 1945. In the drawing in the first publication of this torc, it has a flattened oval shape (Fig. 2.8). However, the curvature of the torc's shaft is also visible in this drawing.
- 62465 Accordingly, the torcs were found crumpled, which directly indicates the nature of the assemblage—a hoard whose components were crumpled for greater compactness and ease of concealment.
- Aar 1478 (II 3689) is a gold torc (750° fineness), measuring 17.5x14.4 cm, weighing 76.77 g (17 solidi), is an imitation of torcs and bracelets of the "widened ends" type. These ends of this and subsequent torcs from Velp are not separated. Torques
- 62470 were worn so that their wide, flattened portion (in cross-section, it resembled a very flat triangle with a truncated apex) rested on the wearer's chest. The back half of the torque's rim resembles a dart. Even at the wax casting stage, it was flattened on the obverse, taking on the appearance of the connected, widened ends of the torque. The torque is decorated with stamp impressions (coinage). The Aar 1478 torque is the only torque from the Velp hoard whose widened portion is entirely covered with stamp impressions from four different types of stamps (Fig. 3), a feature completely analogous to the Rhenen torque. The torque is shaped like an asymmetrical, right-elongated oval.
- 62475 Aar 1477 (II 3692) - gold torque (800° fineness), size 1800 mm. 19.2x15.7 cm, weight 57.32 g (12.6 solidi), identical to the Aar 1478 grivna. The Aar 1477 grivna is the only one of the Velp grivnas with a unique decorative composition. It consists of transverse lines of chased ornamentation, elongated horizontally to the right and left from the center of the wide obverse of the grivna. The lines of the stamp
- 62485 impressions end in arrow-shaped figures (Figs. 3, 4). The grivna, like the other Velp grivnas, has a clasp in the form of a hook and a soldered figure-8 loop.
- Aar 1474 (II 3690) - gold grivna (800° fineness), size 18.8x13.6 cm, weight 58.05 g (13.8 solidi), similar to the Aar 1478 grivna. This and subsequent grivnas are decorated in a standard manner using a diamond-shaped composition formed by the
- 62490 impressions of various stamps and divided by a band of semicircular and charcoal

- stamps (Figs. 2, 3). At the border sections, when transitioning from the rod to the grivna plate, its surface is decorated with a local group of stamp impressions.
- 62495 Aar 1475 (II 3693) – gold grivna (800° fineness), size 24.3x16.7 cm, weight 85.43 g (18.8 solidi), identical to the Aar 1478 grivna, similar in ornamentation to the Aar 1474. At the border sections, when transitioning from the rod to the grivna plate, its surface is decorated with a local group of stamp impressions.
- 62500 Aar 1476 (II 3691) – gold grivna (fineness 800°), dimensions 18.8x14.4 cm, weight 70.25 g (15.4 solidi), identical to the Aar 1478 grivna, similar in ornamentation to the Aar 1474.
- Aar 1473 (II 3688) – gold grivna (fineness 800°), dimensions 24.3x16.7 cm, weight 73.73 g (16 solidi), identical to the Aar 1478 torx, similar in ornamentation to Aar 1474. At the borderline sections where the torx transitions from the drot to the torx plate, its surface is decorated with a localized group of stamp impressions.
- 62505 The typology of the Velp torxes is complicated by their shapes and ornamentation, which are rare for Barbaricum. Similar torxes and bracelets made of gold were discovered in the hoards shown in Fig. 1. Moreover, the Östrich torx, in its ornamentation and dimensions, is typologically identical to the neck ornaments from Velp (Aar 1474, Aar 1475, Aar 1476, Aar 1473). The Östrich bracelet features real, not imaginary (as on torcs) thickenings on its face, decorated with a chased ornament similar to the torcs from Velp (Radig W., 1939, p. 109, Abb. 108).
- 62510 The Aar 1479 drot torc is quite typical of various Germanic and Baltic antiquities from the second quarter of the first millennium CE. Unfortunately, it is precisely this typicality that prevents a precise cultural and ethnic identification of this object. It is only clear that, with the smallest dimensions of the Velp torcs (14.9x14.1 cm), this torc was worn directly against the neck of its owner. Judging by the wear (more likely polishing), the Aar 1479 torc was worn for a long time. Incidentally, the same cannot be said of the other torcs from the Velp hoard. All of them, especially the Aar 1478 torc, show no significant signs of use. The edges of the torcs' faceplates are so sharp that they can cut one's skin. However, in some places, these edges bear traces of mechanical impact (transverse dents), which are most likely the result of
- 62515 The crumpling of the torceniums during their deposit.
- 62525 The shape of the torceniums' faces (Figs. 3, 4) suggests that these are imitation torceniums and bracelets with widened ends. Such headgear (bracelets of the Kolbenring type, a later variant of the Szentendre type) were symbols of the power of the "barbarian" principes among members of the ancient Germanic "heroic society" in the 3rd-6th centuries AD (Lund Hansen U., 1998, p. 348). They could also identify
- 62530 members of families from the "barbarian" aristocracy. Although the Velp torcs imitate details of "barbarian" attire, the distinctive features of their shape and decoration, as well as the manufacturing techniques used (marks of wire drawing, careful hammering of the torc faces, varied stamp shapes, and precisely maintained ornamental compositions), allow us to confidently attribute them to provincial Roman craftsmen. The typological identity of the unique torcs (including the wire torc) from Velp is indicated by the distinctive 8-shaped loops of their clasps. It has been proven that torcs with such loops appeared on the Rhine limes of the Empire around the mid-3rd century AD (Stjernquist B. 1955, p. 137) and serve as prototypes for neck ornaments with so-called "pear-shaped" clasps.
- 62535 The decoration of the Velp torcs is particularly interesting. It is represented by compositions of impressions from round, semicircular, and triangular stamps. In old German historiography, they are classified as *eingestempelte Ornamente*, a type of decoration applied by single punches (Fig. 5, Nos. 1-4, 6, 7, 17, and 18 in the lower part of the figure). As a rule, they are characteristic of Scandinavian antiquities of the early phase of the Great Migration Period. They arrived in northern Europe directly from the Roman provinces. It is significant that the aforementioned stamp forms are not characteristic of Prussian Sosdala style material, which was later than Scandinavian punch decorations (Aberg N., 1919, 47, 49). In historical Prussia, Sosdala style ornamentation exists in phases C2/D2 (possibly from phase D1), and on the right bank of the Neman, in phases C2/D1. The custom of applying such decoration to metal parts of military attire was brought to these Baltic regions by veterans (auxiliary foot soldiers and cavalrymen) who had served in the Roman armies on the Rhine or Danube Limes (Kulakov V.I., 2006, pp. 64, 65) upon returning home (?). The Velp hoard was discovered in one of the areas where these "barbarian" units were
- 62540 likely deployed in the service of Rome. Unfortunately, by the end of the Empire, it no longer had any other troops. Therefore, it is particularly clear why the shape of
- 62545
- 62550
- 62555

the Velp torcs is based on prestigious Germanic jewelry, characteristic exclusively of the "barbarian" warrior elite.

The Velp torcs do not feature Sosdala-style ornamentation, typical of which are star-shaped compositions. However, one of these torcs bears the impression of an almond-shaped stamp with a slight depression in the center (Fig. 4, Aap 1478, at the edges of each of the impressions of a triangular stamp). An analogue of this stamp is presented on the buckle from Briža (Bez. Litomerice) in the Czech Republic (Tejral J., 2001, p. 40), typical of antiquities from the Untersiebenbrunn horizon, attributed in Central Europe to the D2 phase (c. 380/400 – c. 440/450 AD) (Kazanski M., Koch U., 2001, p. 85). Such depressions created the effect of flat relief on images that were actually made by engraving, accentuated by a dot stamp. This ornamental technique, represented, in particular, on a fragment of a silver dish from hoard B in Mlotechno (Eggers type 115), appears, judging by this find, as early as phase B1 (Kulakov V.I., 1998, p. 99) and is the earliest precursor to the decoration of the Velp torcs and, accordingly, to the Untersiebenbrunn style ornamentation. The absence of traces of ornamental degradation on the Velp torcs allows them to be dated to the beginning of this horizon. It is possible that the ornamentation on the torcs is a unique precursor to the Untersiebenbrunn style decoration. Overall, the presented arguments allow us to tentatively date the Velp torcs to a time of ca. 370–400 AD.

The origin of the Untersiebenbrunn decoration itself is extremely interesting and requires a comprehensive art historical analysis. For now, it can be assumed that this type of ornament represents the final form of development in the decoration of provincial Roman military equipment and should be located at the end of a typological series that began in the Julio-Claudian era with decoration in the *Opus interrasile* style, continued in the era of the "soldier" emperors with flattened relief, the recessed parts of which lost their depth over time. Ultimately, having lost the skills of their predecessors, the craftsmen of the twilight of the Empire, having little memory of the need to create certain recessed parts on their products, began to imitate them with clusters of various stamps. From a distance, products with such decoration (the Untersiebenbrunn style) gave the impression of objects with erased, barely visible remnants of relief images. Fashion over the centuries (including modern) provides a series of examples of a similar loss of the original meaning of decoration or an object during its long-term production (the transformation of a top hat into a cap, the mutation of jeans from workwear into a pointlessly worn haute couture accessory).

While the typology and chronology of the Velp torcs can be resolved by incorporating similar objects from the Barbaricum material culture of the late 4th century AD, the semantic meaning of these objects can only be revealed by incorporating purely Roman analogies, and quite early ones at that.

Before clarifying the semantics of the torcs in question, we should attempt to establish the principles of their wearing. A votive nature for these torcs is clearly excluded, since from the time of the Edict of Milan (313 AD), the Council of Nicaea (325 AD), and the unsuccessful attempt to recreate the patristic cults under Emperor Julian the Apostate (355–363 AD), Christianity became dominant in the Empire. Offering precious gifts to the Roman gods was no longer possible by the end of the 4th century AD.

Faint traces of wear are present on almost all the torcs (except Aap 1479 and Aap 1478) at the top of the widened center of their obverse. It can be assumed that all these torcs were worn simultaneously, with the smaller-diameter torcs placed on top of the larger-diameter torcs, partially overlapping them.

According to this principle, a reconstruction of the wearing pattern of the Velp torc complex has been conducted (the order of the torcs is shown in Fig. 6). In this complex, the two lower torcs – Aap 1475 and Aap 1476 – stand out due to their large dimensions. They were clearly designed to be worn on the forearm. The remaining torcs, with decreasing dimensions, form a cylindrical figure in the wearing pattern. In other words, these torcs actually covered their owner's neck. The space created between the backs of the three lower and four upper torcs (Fig. 6) could have been filled, for example, with a neck scarf. This essential part of a Roman legionary's attire could have complemented the shine of the torcs' gold and protected the wearer's neck from chafing from the torcs' sharp edges. Despite the impressive appearance of the entire torc set, wearing them all together was entirely feasible due to their light weight.

The aforementioned phenomenon of increasing torc parameters is largely duplicated by

their weight values in the following sequence, expressed in the scruple (1.137 g), a unit of weight typical of Roman times used in jewelry.

62625 Aar 1479 - 36.52 scruples
Aar 1477 - 50.41 scruples
Aar 1474 - 51.05 scruples
Aar 1476 - 61.78 scruples
62630 Aar 1473 - 64.84 scruples
Aar 1478 - 67.84 scruples
Aar 1475 - 75.13 scruples

62635 Of course, the non-exact multiples of tornine weights in the Roman weight system depend both on possible errors by the makers of these items, and on microscopic losses (scratches, cracks, etc.), which distorted the appearance over time. The weight of the hryvnia, as defined in ancient times. However, the weight stop dividing the hryvnias is more visually clear:

62640 Between Aar 1477 and Aar 1474 - 0.64 scruples, or 1/40 of an ounce (there are 24 scruples in an ounce).

Between Aar 1474 and Aar 1476 - 10.73 scruples, or 1/5 of an ounce

Between Aar 1476 and Aar 1473 - 3.06 scruples, or 1/12 of an ounce

Between Aar 1473 and Aar 1478 - 2.68 scruples, or approximately 1/12 of an ounce

62645 Between Aar 1478 and Aar 1475 - 7.6 scruples, or 1/6 of an ounce

62650 While a fairly clear Roman duodecimal foot is visible between the above-mentioned grivnas, the Aar 1479 drot grivna weighs 36.52 scruples in the Roman weight system and does not have a multiple difference (foot) with any of the other grivnas in the complex. This clearly indicates that these torven coins were produced in a workshop staffed by artisans who strictly adhered to the Roman weight system. In contrast, the creator of the Aar 1479 torven coin (weight: 9 solidi) did not adhere to this system and relied on the coarser solidi weight unit popular in Barbaricum. The gold fineness of the torven coins, generally measured in 800°, is less clear. Only the largest torven coin, Aar 1478, fully ornamented on the obverse, has a gold fineness of 750°.

62655 It is interesting to compare the sequence of torven coins according to their increasing metric and weight parameters. Their dynamics generally coincide as follows:

By increasing metric parameters

By increasing weight parameters

62660	Aar 1478	Aar 1474
	Aar 1477	Aar 1473
	Aar 1477	Aar 1476
62665	Aar 1474	Aar 1478
	Aar 1473	Aar 1475
62670	Aar 1476	

62675 The question of the gender, age, and social class of the owner of the Velp torceniums is important. The custom of wearing torceniums as neck ornaments by Roman men and women was not only not used throughout Roman history but was also considered alien to them. It should not be forgotten that the bearers of the tradition of using torceniums (Latin: torques) - the Celts, and later the Germans - were traditional adversaries of Rome. Nevertheless (more likely due to this "barbarian" attribute, which was perceived by the Romans as a trophy - Makhlayuk A.V., 2006, p. 328) in the Roman army, grivnas, along with bracelets and phalerae (chest plaques), became insignia for ordinary legionaries at the beginning of our era. Already in the era of

62680 Augustus, on the tombstone of the centurion of the first cohort of the XVIII legion Marcus Caelius, who died in 9 AD in the Battle of the Teutoburg Forest and was buried near Xanten (Netherlands), award bracelets are visible (Fig. 7), tied with fabric cords to the shoulder plates of his cuirass. The centurion's neck was adorned with an award twisted (tortured?) grivna. If in the era of the early Empire award grivnas were fastened with clasps on the back of the neck, then in the middle - second half

62685 of the 4th century AD. Such neck awards have thickenings on their front, imitating the widened ends of a torc. They adorn the necks of the bodyguards (Latin: singularis) of the Emperors Constantius II (Fig. 8) and Theodosius I the Great (Fig.

9), depicted on silver dishes kept in the museums of St. Petersburg and Madrid. Incidentally, it was the emperors who could personally present (apparently, approve) awards not only to "officers" but also to ordinary soldiers (Latin: *caligae*) of the legions (Makhlayuk A.V., 2006, p. 324). Such torcs were fastened on the back of the warrior's neck (Fig. 5.1). The torcs from Velp are constructed in exactly the same way. Apparently, this principle was also used in early Byzantium, which inherited some of the Roman military customs. True, during the reign of Justinian I the Great, his bodyguards, judging by a mosaic in the Basilica of San Vitale in Ravenna, wore torcs with medallions on the obverse. These medallions were either adorned with stone inlays or decorated with enamel. An example of such torcs is found in the Rhenen hoard. The flat detail found on the reverse of this torc emphasizes the importance of its weight, which apparently corresponded to the decree for this award. Thus, the typological development of Roman award torcs (*torques*) in the first half of the sixth century is interrupted.

Early on, the Roman army had a tradition of multiple awards – *dona militaria* – since the Principate. Phaleres were awarded to legionaries who distinguished themselves in battle as a set of six or more metal or even glass plaques, connected by straps for fastening to the warrior's chest (or armor). When awarded, torcs were accompanied by bracelets (Fig. 10.2). In our case, the process of putting together a set of award *grivnas* can be reconstructed as follows. A warrior, who possessed his own personal *drot grivna*, indicating his "barbarian" (possibly Germanic) origin, was awarded a single Aar 1478 *grivna* for a certain feat. Its front plate is completely covered with chased ornamentation. The side and back *drot* parts of the *grivna*, hidden by a cloak, remained unadorned. Then comes the next award, also a single Aar 1478 *grivna* (Fig. 3). However, the master, apparently aware of the secondary nature of this award, decorates only part of the front side of this *grivna*. The rest of the surface of its front plate is partially hidden by an earlier award – the Aar 1478 *grivna* – and does not require decoration. With the same principle of economy in his work, the same (or another?) master approached the third, already multiple special award – four *grivnas* Aar 1473, Aar 1474, Aar 1476, and Aar 1475. There is no direct connection between the weights of these *grivnas* in the form of a stack of scruples (see above). The four aforementioned *grivnas* are stereotypically provided with symmetrical series of triangular compositions of stamp impressions in the central part of the *grivna*'s obverse plate. This third award, possibly distinguished and characteristic of Roman military traditions (Kolobov A.V., 1999, p. 67), could have been the warrior's final reward for his exploits for the glory of Rome. Considering the finds of similar *grivnas* in Oestrich and other locations in the Lower Rhine basin, it can be hypothesized that standard gold award *grivnas* existed on the Rhine limes at the end of the 4th century AD. Due to some unexpected situation, either the warrior himself deposited his awards along with his personal *grivna*, or (more likely) some enemy of Rome, having defeated this hero in combat, tore off both his *dona militaria* and personal *grivna*, hiding them on the right, German bank of the Rhine. Along with these objects, apparently connected by a loop made from a fragment of a gold dart (Fig. 2.6), two gold rings with shields were also found in the ground. These pieces of Roman jewelry (on the shield of one of the rings is a profile image of the Emperor /?/ – Fig. 2.7) could also have been part of the inventory of an unknown Roman warrior. It is impossible to interpret these rings as awards (like the clearly "barbarian" spiral ring – Fig. 2.5). Ever since the time of Julius Caesar, enemies have sought to steal the awards of a defeated legionary, valuable both in terms of material and social status (Cowan R., 2005, pp. 28, 29). It is noteworthy that in subsequent wars, including World War II, soldiers in many European armies paid particular attention to the enemy's awards, considering them prestigious trophies and first adding them to their poles and knapsacks. Such trophies, during the breakthrough of the Rhine limes at the turn of the 4th and 5th centuries, fell into the hands of warriors from various tribes and were deposited in the soil of their homelands (Fig. 1).

As noted above, the unique shape of the Velp torcs prevents any close parallels from being found in Roman or "barbarian" archaeological material from the late antique period. This is due to the extreme rarity of finds of Roman award torcs, which were highly prized by both their owners and Rome's enemies. The author of these lines is aware of only one of the few finds of a similar *dona militaria*. This is a fragment of a torc from Carnuntum on the Danube limes. The torc was a fragment of a ring-shaped curved plate, ending in a pear-shaped clasp. A relief Latin inscription was applied to this plate during the wax matrix creation stage, of which only a fragment,

62755 "felices tun...", has survived. It is possible that the full inscription was intended to read "felices Tungri" and refer to a representative of the Germanic Tungrian tribe (modern Belgium), who constituted the first border ala of the Tungrians in the province of Dacia in the 2nd-3rd centuries AD (Roes A., 1947, p. 181). On the inside of the torc, runic (?) graffiti is faintly visible (Beninger E., 1934, Taf. 300.6).
62760 Both the Velp-type torcs and the torc from Carnuntum are flat, yet they give the impression of being massive objects and are not burdensome to wear.

Thus, the torcs of the Velp type are clearly related to dona militaria. Modern classical studies have come to the conclusion that "in the Antonine period (2nd century), the dona militaria, including bracelets and necklaces (= torcs - K.V.), began to be supplanted by purely material methods of rewarding distinguished warriors..." (Kolobov A.V., 1999, p. 71). In late Rome, gold medallions with inscriptions extolling the exploits of the Empire's defenders also served as awards (Makhlayuk A.V., 2006, p. 331). Finds from Velp demonstrate the existence of at least one type of dona militaria – torques – during the Battle of Adrianople. Artwork from the 5th and 6th centuries contains images of award (status?) torques worn by imperial warriors during the developed phase of the Great Migration Period. The long hair of the bodyguards of Theodosius I the Great and Justinian I the Great (a tradition of ancient Germanic capillati warriors) has justifiably led to their interpretation as Germanic (Fuchs S., 1943, p. 150). The fact that they wore torcs (especially in the presence of the Emperor) indicates that they do not serve as pagan jewelry, but are insignia of warriors whose bravery earned them the right to be part of the Emperor's inner circle.

62780 The opinion on the cultural, ethnic, and social origins of the Velp torcs was recently expressed by Professor Dr. Wilfried Menghin, Director of the Museum of Ancient and Early History (Berlin). He believes that "...the Velp hoard belonged to one of the Frankish leaders who, from the second half of the 4th century, assumed control of the Empire's borders between the Maas and the Scheldt as Roman foederati" (Menghin V., 2007, p. 42). The above series of evidence, on the contrary, suggests that:
62785

1. The Velp torcs were made at the end of the 4th century AD by provincial Roman artisans.
 2. These objects are not jewelry, and certainly not status accessories of the status/sacred property of "barbarian" kings, but are Roman military awards, dona militaria.
 3. The Velp torcs are considered awards traditionally issued to rank-and-file soldiers (caliga) in the Roman legions, who were recruited primarily from among the "barbarians" during the Battle of Adrianople. Members of the legionary command staff, to which a certain Frankish king may have belonged (according to V. Menghin), were presented in late Roman times with honorary banners and spears (vexilla et hastae) (Makhlayuk A.V., 2006, p. 329). Thus, the erroneous conclusions about the origin of the Velp torcs drawn by a Berlin colleague, a specialist in early medieval double-edged swords, become clear.
- 62800 The location of the Velp torc hoard corresponds to the northern part of the Rhenish Limes (Fig. 1). On December 31, 406, Gaul was subjected for the first time to a powerful attack from the east by "barbarians," including representatives of the Huns, Vandals, Alans, Suevi, and Burgundians (Perin P., Feffer L-Ch., 1987, p. 80). This invasion, which was the final battle for many of its participants, could have easily taken its toll on one of the warriors of the Rhenish Limes, guarding the volatile imperial border as part of one of the auxilia or a detachment of limitanei warriors. This warrior (most likely a military leader) died defending the Roman borders; his awards and rings became the loot of a certain Germanic "barbarian," who buried his trophies in the ground near the site of the battle on the limes, most likely as a sacrifice to the ancestral gods. Less than a century later, at the beginning of the reign of King Clovis (in 481 or 482), this section of former imperial territory would be finally occupied by the Franks (Perin P., 1995, p. 252).

The Great Cameo of Constantine

62905 The large agate cameo in the Royal Dutch collection known as the Great Cameo takes the form of a fully classicising scene of imperial triumph and harmony that surely owes a stylistic debt to Augustan and Julio-Claudian gem cutting. The imperial family - Constantine, Fausta, Crispus and a second female figure who might be identified as Constantine's grandmother Claudia - rides in a triumphal chariot pulled by two

62910 bearded centaurs, one of whom holds a trophy over his shoulder while trampling underfoot two bare-headed and clean-shaven enemies, one of them appearing to be wearing a Roman military tunic. In the foreground a *cantharus* or wine vessel lies on its side on the ground. In the background a winged Victory spectacularly shoots across the sky in the direction of the imperial party; she holds out in both hands a victor's garland with which to crown the emperor. Constantine, caught in profile, appears on the gem wearing a laurel wreath and civilian rather than military garb, he holds in his right hand a spear or thunderbolt aimed at the enemies ahead of the chariot. Fausta is shown with veiled head, holding a corn ear or poppy head in her

62915 hand, perhaps as a symbol of dynastic fertility and continuity. Crispus, though clearly still a boy, is dressed in a military cuirass and helmet, and holds his left hand ready on his sword scabbard. Again, this might be taken as an individual image of dynastic readiness even into the next generation. The final figures to need identification are the two men being trampled by one of the centaurs drawing the chariot. This is obviously a standard way to portray the fate of enemies of Rome and the power of the emperor; however, on most occasions the enemies being killed and humiliate in this way are quite obviously barbarians, even at this period most commonly bearded northern barbarians. But given the appearance of the two overcome

62920 foes it can only be assumed that they are intended in this context to represent Maxentius's army defeated by Constantine at the Battle of the Milvian Bridge in AD 312 and shown being decimated by Constantine's forces on the contemporary frieze on the Arch of Constantine.

62935

By contrast or comparison from the article of Ruurd B. Halbertsma: ***Nulli tam laeti triumphi - Constantine's victory on a reworked cameo in Leiden***

62940 The scene shows a chariot, drawn by two prancing centaurs. On the chariot four persons are depicted: a man with a laurel wreath, holding a stylized thunderbolt, and embracing, with his left arm, a woman. The woman wears a wreath or diadem. Her head is covered with a veil. In her left hand she is holding a corn-ear and a poppy head. She is pointing with her index finger towards a young boy. Behind the man a second woman is depicted, wearing a laurel wreath. With her right hand she is also pointing

62945 at the boy in front of the couple. The boy is dressed in military gear and reaches with his right hand behind his back to produce an arrow from a quiver. With his left hand he touches the scabbard of his sword. A helmet with plume covers his head. The two prancing centaurs form a lively composition. They are supporting an upturned shield on which a *tropaeum* is visible, consisting of a scaled cuirass and a scabbard hanging from a belt. The right centaur is upholding the pole on which the tropaeum is draped. Under his hooves two figures are visible. The person on the left wears a Roman tunic and is crouching, holding the leg of his partner and looking in fear at the centaur above him. The other man is wearing a military outfit and tries to support himself on his shield. His downward gaze shows he is succumbing, only moments

62950 away from death. Under the hooves of the left centaur a fallen calyx crater is visible, lying between the eight-spoked wheels of the chariot. Above the centaurs a winged Victoria in a long garment is flying towards the group in the chariot. In her outstretched hands she holds a crown, from which a very long double ribbon is spiralling. The ribbon makes a few twists then disappears behind the *tropaeum* and reemerges above the head of the right centaur, where it ends in straight lines.

62960

GREECE UNDER THE TURKS. I

62965 From the second half of the fifteenth century to the end of the seventeenth century, a large part of what now constitutes the Kingdom of Greece belonged to Turkey; and beginning with the second half of the sixteenth century, only a few Ionian Islands and a few Cyclades were free from Turkish rule. For the first time since the Frankish conquest, a deathly uniformity, broken only by a few local privileges, replaced the

62970 feudal states whose fortunes had helped shape the annals of at least two centuries earlier. Greece, so often prey to division, had at last found unity, but at the cost of its freedom: and the Turkish conquerors, following in the footsteps of ancient Rome, had trampled on the last vestiges of Greek independence. Once again (with relatively minor exceptions), the Greek world obeyed a foreign ruler, who resided in

62975 Constantinople, and whose minions more or less arbitrarily governed the affairs of the Greek subjects. There is, however, an important difference between the two periods in which Turkish rule in those regions must be divided. During the first of the two

62980 1) According to W. Miller in the August issue of the Westminster Review. (ending with the conquest of the Morea by Venice), Turkey was a power that inspired awe throughout Europe; but in the second (ending with the foundation of the Kingdom of Greece), the Ottoman Empire increasingly declined, except in the art it never

62985 lost: martial arts. Like the ancient Romans, the Turks were also good soldiers at all times: but, although they equaled their predecessors in some other respects, in one respect this was certainly not the case: they were poor administrators. Even if (as was often the case) their regulations were impeccable, practice tended to undermine all that was good.

62990 The political structure of Greece under the Turks was essentially simple. The Greek regions were included within the administrative circle of the Beylerbeg (i.e., lord of lords) of Rumelia (Rumili), who held his official residence in Sofia. They were divided into six "sandzhaks," so called after the flag that symbolized each region of any size—a division that reflected the warlike nature of all Turkish regulations.

62995 Since 1470, when the conquest of Euboea crowned the Greek conquests of Muhammad II, the six sandjaks were as follows: Evripos (Euripos or Euboea), Trikkala, Lepanto, Karlili, Joanina, and Morea.

63000 Number One of these six encompassed Euboea, Boeotia, and Attica. The capital of this important region was Chalcis; and among its other cities of some importance were Athens, Thebes, and Livadia. Karlili encompassed Aetolia and Acarnania, as well as the immediate vicinity of the Gulf of Arta or Ambracia: its name was derived from a certain Carlo Tocco, whose extensive possessions had fallen to the Turks. As for the Morea, the capital of that peninsula alternated between Corinth, Mistra, and Leondari

63005 (the ancient Megalopolis), until the conquest of Nauplia from the Venetians in 1540 made that fortress the official residence of the Turkish Pasha. When the Duchy of Naxos ceased to exist shortly thereafter, a seventh Greek sanjak was formed from the Cyclades and the island of Santa Maura, the ancient Leucas. Some Cyclades were excluded from this because they were venerated by the Sultana Favorite. And later,

63010 when Crete was conquered, three new sanjaks were formed from that large island: Candia, Canea, and Rethymno. In turn, each sanjak was divided into a certain number of cazas, or districts, 23 of which belonged to the Morea. Athens appears to have been the capital of such a caza (belonging to Evripos: see above) from 1470 to around 1610. Just as each sandjak was

63015 governed by a Pasha (in the Cyclades by a Capudan Pasha, i.e., an Admiral), so too was each caza under the administration of a lower-ranking official, called a Voivode, who was assisted in jurisprudence by a Kadi. Faithful to the Turkish feudal system, which had been established in Thessaly at the end of the 14th century and introduced in Aetolia and Acarnania after the fall of the

63020 aforementioned Tocco dynasty, Muhammad II divided Morea and Hellas (in the narrower sense) into fiefs and granted them to his former comrades-in-arms. These fiefs belonged to two kinds: the zaimet and the timar. The first included the large fiefs and required their holders to equip and deploy fifteen horsemen each. The timar was the name of the smaller type, of which each owner (feudal lord) was

63025 required to provide only two men for the cavalry. The banner of the sandzhak-bey (Pacha) was the united point for all those feudal lords and the horsemen they provided, when the need arose. Around the middle of the 17th century, the six existing sandjaks had been fragmented into 267 zaimets and 1,625 timars, together

representing a total of 7,255 horsemen.

The numerical difference between the large and small fiefs became even more pronounced when the same system was also applied to Crete. That island had to be able to provide 5,350 horsemen, divided between 2,550 timars and only seventeen zaimets. Initially, this system was not based on a hereditary aristocracy. Originally, the timars were simple annuities, awarded as a reward for services rendered to the Sultan by senior warriors, who could perhaps still be summoned to appear with their subjects at the summons of their feudal lord. In the golden age of Turkish rule (assuming one can ever use the word "golden" of anything Turkish), the son of such a vassal was usually only favored with a large fief after he had proven his suitability with a smaller one. However, the Turkish system of government soon developed, as almost everywhere such systems do: starting with no other criterion for reward than competence, it ended up replacing competence with favor as much as possible. The abuse increasingly crept in that it was the Beglerbeg in Sofia to whom the Great Lord entrusted the endowment of large and small fiefs; And it was quite natural that this powerful ruler would favor his own favorites, just as an English cabinet chief, given free rein by weak or biased monarchs, is wont to grant peers and other titles to men he believes he can rely on, or whom he hopes to win over by doing so. It should therefore come as no surprise that in the second half of the seventeenth century, both in Sofia and Constantinople, the custom had crept in that, if the holder of a zaimet or timar died on the field of honor, his fief was divided into as many parts as he left sons, unless the annual income did not exceed three thousand aspers, in which case the eldest son was favored with the entire fief. However, if the feudal lord died otherwise than in battle for prince and country, his fief fell to the Beglerbeg, who could, at his discretion, grant it to the deceased's heirs, or make someone else happy with it, or sell it for his own profit.

1) The asper is the smallest Turkish coin, worth barely four cents.

Initially, the Turks had enough common sense not to interfere with the local government of the Greeks, which had existed for centuries before the Turkish conquest. Under the Byzantine emperors, Greek communities often had themselves represented at the court in Constantinople by men who were not always chosen from their own ranks. This was also sometimes the case with an association of communities. Thus, we read that in the eleventh century, Michael Psellos represented the Cyclades in the great court city. It also happened that, instead of a permanent representative, an envoy or embassy from a municipality, an island, etc., would occasionally travel to Constantinople to discuss special matters with the high government. Such representations also seem to have been common under the Venetian administration. At least it is attested that when the island of Tenos belonged to Venice, there was a council of notables whose task it was to oversee the administrative measures of the Italian officials. Like the Romans, the followers of Muhammad II, etc., were perfectly willing to grant the Greek municipalities a certain degree of autonomy. Therefore, these municipalities were given free rein to promote trade and industry, establish schools, etc., while the Greek language remained in use for all public affairs. There seem never to have been any fixed rules regarding all this; But we may assume as common custom that each community had its own officials (Greeks, of course), that these men were elected (albeit indirectly) by the Christian population (or a portion thereof), and that these representatives (if one may use that term) were given the names of Presbyters, Archons, Foremen, or, in Turkish, "Khodzja-baskis." Thus, even in the late period of Ottoman rule, on the island of Psara the entire community gathered annually to elect forty electors, who in turn appointed four "Elders (Presbyters) of the community." We also read that around the same time on the island of Spetsai, the five foremen were elected annually by the ship's commanders and the wealthy citizens—and, well into the eighteenth century, the important island of Hydra was still governed by its priests with two laymen as assessors. As for the mainland of Morea, it enjoyed special municipal privileges. It was allowed to send two or three Foremen to Constantinople, whose residence in the metropolis enabled them to exert their influence to mitigate the extortions of the Pashas. Moreover, each province of the peninsula was allowed to send two of its leading citizens to the Pasha's see once or twice a year to discuss the interests of Morea with him. Both there and in Thessaly, it was not uncommon for municipal positions to be passed down from father to son. Unfortunately, this also applied to the irreconcilable feuds that were common among the prominent Christians of Morea. The official duties of these gentlemen included levying local taxes, managing the municipal treasury, deciding civil cases, and protecting the oppressed with advice

and deeds. Some performed the latter duties without regard to persons; but there was also no shortage of individuals whose behavior earned them the name "Christian-Turks."

Both the law of "the great Prophet" and that of humanity opposed the complete conversion of the Greeks to Islam. Mohammed II, who spoke Greek fluently and knew the Greeks well, demonstrated his statesmanlike wisdom by his plan to govern his Greek subjects through their own clergy. He was convinced that he and his followers constituted, as it were, a foreign garrison in a hostile country; And he believed that a new crusade of Roman Catholics against the conquerors of "the East" was by no means impossible. The bitter hatred that Eastern and Western Christians bore each other provided the wily Sultan with a powerful incentive not only to tolerate the "Orthodox Church," but even to protect it. He realized that by favoring one branch of Christianity, he would prevent collusion with the other; and, to bring this well-thought-out plan to fruition, he chose a particularly suitable instrument.

Among the most vigorous and able opponents of the reunification of the two Churches was George Scholar, a man as influential among the Eastern as he was hated by the Western leaders of the Church. No sooner had Constantinople fallen into the hands of the Turks than the Sultan ordered a search everywhere for this unwavering champion of the "Orthodox": and when he was finally located, he issued orders aimed at having him elevated to "Ecumenical Patriarch." For centuries, this was the name used in Constantinople to refer to a sort of Eastern pope. Scholarios was naturally elected, specifically under the name of Gennadios II. The Sultan received him ceremoniously, showed him the utmost kindness, and after the festivities, escorted him to where his horse was waiting, and personally helped him into the saddle. An imperial decree (berat) defined the position, power, and privileges of Gennadios and his successors. In this document, they were declared "exempt from taxation and irremovable." It is a pity that the text of this important document has been lost; So we cannot judge to what extent the chronicler Phrantzes is correct when he claims that in that state document, the conversion of Christian churches into mosques was prohibited.

Incidentally, the loss of the original text is not so regrettable, since so much was later changed that the privileges in question were increasingly curtailed.

One thing is certain: Mohammed II vested the Patriarch with the supreme authority over all Greek Orthodox churches and monasteries, the right to depose bishops and archbishops, and supreme jurisdiction over his entire clergy. He was also granted jurisdiction over all matrimonial matters and all other points of civil law, in which the parties involved, being Christians, preferred not to submit to the judgment of a Turkish court. He was authorized to levy taxes on behalf of the Church, and this from both clergy and secular persons. But the most important point was that all church property would be honored, and no Christian would be forced to convert to Islam. It's a pity, however, that on all these points, the history of Greek Christians in Turkey reveals an ever-increasing denial of the original intentions of Mohammed II. A later decree, for example, stipulated that the Patriarch could be deposed in three cases, the oppression of his flock, violation of ecclesiastical law, and high treason—all flexible expressions that could easily lead to abuse.

Mohammed II himself provided an example of this when he deposed Patriarch Joseph I for refusing to ratify the marriage that the widow of the last Duke of Athens had contracted with Amoiroutzes, the traitor who had betrayed Trebizond to the Turks, and whose wife was still alive. During the seventeenth century, three Patriarchs were deposed; and there are even examples of Sultans imposing punishments on Patriarchs reminiscent of the gruesome mutilations of the Byzantine emperors. How quickly the Cathedral of St. Sophia became a mosque is well known; and the number of other Christian churches that later suffered the same fate is legion. Thus, while traveling through Greece, I saw, among other places, dilapidated buildings in Larissa and Livadia, which had first been churches and later mosques. The Patriarch's office was also not respected. Connected to the Church of the Apostles by Mohammed II, it was subsequently moved repeatedly until it finally (at the beginning of the seventeenth century) found its present location in Phanar.

Phanar is the Greek quarter of Constantinople located on the northern shore of the Golden Horn. Trans.

Also, payments were occasionally levied, which were demanded of the churchwardens; and it was not long before the elections of the Patriarch were dominated by bribery. The Greeks had only themselves to blame for this regrettable innovation. After the fall of Trebizond (1461), many prominent figures from that place sought a good opportunity in Constantinople to recover. Among the prestigious positions they coveted was that of Patriarch. This was already evident in 1467, when they attempted

to oust Marcus II, the third successor to the aforementioned Gennadios, from his throne. They succeeded only too well. Marcus was deposed; and one of their own took his place, but only after he had pledged to pay the Sultan a thousand gold pieces annually and relinquished the annual stipend his four predecessors had drawn from the imperial treasury. Once the first step had been taken on the disastrous path of simony, their example was increasingly imitated. Just two years later, the displaced man was ousted when a wealthier admirer offered double the amount. Later, the annual "tribute," or rather bribe, rose to three thousand gold pieces; Moreover, large sums were often spent bribing courtiers, eunuchs, janissaries, Sultana Favorites, and the like, while, to make matters worse, these enormous expenses were recovered as much as possible from the community and the lower clergy.

Thus we see that the unsavory history of the Ecumenical Patriarchate bears striking similarities to the medieval papacy, which also did not shy away from such base tactics. And, as for the Eastern supreme churchwarden, after the Western Reformation, that high office became even more the object of all sorts of intrigue, as Jesuits and influential Protestants vied in attempts to secure the Patriarchate for men who might advance their respective interests. In the 76 years preceding 1700, no fewer than fifty Patriarchal elections took place; and most of them were marred by large-scale bribery. Colossal debts began to burden the Patriarchate so much that the newly elected dignitary usually resorted to selling the well-paid positions he was to fill. No wonder this increasingly widespread problem became a primary cause of the aversion the Greek Church instilled in the many Christians living in the Turkish Empire who belonged to a nationality other than Greek. The history of the Balkan Peninsula abounds with examples of the extortion perpetrated by Greek bishops against the common people, who were condemned to compensate their clergy as much as possible for the financial sacrifices they had made to obtain their office.

Another cause later contributed significantly to the Turkish government's weakening of the dignity and privileges of the Ecumenical Patriarch. Though Mohammed II had considered and honored it as a powerful bulwark against the Roman Powers, more than a century later Rome, as a result of the Protestant secession, had become considerably less dangerous, while Venice had lost its last possessions in the Morea, and Spain, too, inspired less and less fear. There was more. France, the "oldest daughter of Mother Church," and for a long time a great protector of the Jesuits, had become Turkey's ally; and when these dangerous people first appeared in Constantinople in 1609, they, relying on France, plotted against the Patriarch with all their might. Thus, the Sultans had little to fear from a hopelessly divided Europe and a clipped Papacy: and therefore the Grand Lord could safely degrade the Patriarch. Beginning in 1657, this spiritual ruler was no longer installed by his secular overlord in person, but by the Grand Vizier; and in other respects as well, the honors granted him were later increasingly curtailed.

Yet, the Patriarchs continued to exercise a power in all of the Sultan's possessions, which was to be reckoned with from both a political and an ecclesiastical perspective. It was a power, such as many a Patriarch under the Christian Emperors had not even enjoyed, nor was they granted it when the secession from the Kingdom of Greece significantly curtailed their authority. Before the Greek War of Independence, the Ecumenical Patriarch was the ecclesiastical, and in a certain sense also political, head, not only of the Greeks, but also of all Bulgarians, Serbs, Armenians, etc., belonging to the same Church. The general name commonly given to all these nationalities in Turkish territory was "Romans"; because, especially in Turkey at the time, origin was paid much less attention than the fact that they all professed the religion of the "Roman" Constantine the Great. Furthermore, the Modern Greek language, unlike the ancient Greek, was, and still is, labeled "Roman."

Returning to the Ecumenical Patriarchs, these high clergymen were also the ecclesiastical heads of all "Orthodox" communities, which were among the Venetian conquests; and as long as a permanent Venetian envoy remained in Constantinople, he negotiated no less with the Patriarch than with the Porte. About a year after the fall of Constantinople, Muhammad II concluded a treaty with Venice, in which the Patriarch was permanently guaranteed all the revenues that had been paid to his predecessors by the Christians in the Levant. In many places in the chronicles, mention is made of the Patriarchs' intervention on behalf of the Orthodox who lived in Venetian territory. At times, they intervene on behalf of the Greeks of Crete or southern Morea, at other times (and successfully) they urge the preservation of the Julian Calendar in the Venetian Levantine possessions. In one place, we are pleasantly surprised by a philippic against the co-religionists in Crete, because of their persecution of Jews.

The peculiar relationship of The Patriarch's role as representative of a remarkable

imperium in imperio is particularly striking, as evidenced by the fact that the Porte used to negotiate with him through the intermediary of Reis Effendi, the Minister of Foreign Affairs. We see, then, that there was good reason to call such a powerful personage a "supreme lord," even a "king." This involuntarily reminds me of the Pope's relationship with the outside world since the loss of the Papal States. Like the Pope, the Patriarch had no secular authority, but his spiritual power extended far beyond the capital, where another ruled. Like the Pope, he negotiated with foreign powers, even where religion was non-existent, and occasionally conspired against the monarch, who had guaranteed him full enforcement of his spiritual rights. Although the Koran forbade violent conversion, a combination of circumstances worked to swell the ranks. to swell the Muslim population. Since the Turks were few in number compared to the millions of Christians who groaned under their yoke, they soon realized that in the long run they would not only be unable to expand their conquests, but not even to maintain them, unless they also included Christians (and many of them) in their ranks. Therefore, they early decided to follow the example (though in reverse) of some Christian rulers in the Levant, who included young Turks in their armies. In response, Sultan Orchan had already, in the first half of the fourteenth century, established the later notorious army corps of Janissaries. Until the mid-sixteenth century, these corps consisted exclusively of Christians, raised from childhood in the teachings of the Prophet.

Initially, the number of children employed for this purpose averaged a thousand per year. At the tender age of six or seven, they were taken from their parents, until later (probably not long after the fall of Constantinople) a regular levy of prospective soldiers was prescribed by all Turkish dependencies. Only a few places were exempt from this. Gradually, this levy of Christian children, who were to become Muslim warriors, became a systematic and ruthlessly enforced means of proselytizing. While initially these levying were far from annual, they later became so. Each levy was preceded by the appearance of a Janissary officer, accompanied by a scribe, in the main town of each district, where he demanded from the local government a complete list of all Christian families living there. This resulted in every Christian father being forced to declare which children he had who were eligible and then to have them appear before the court of the military commissioner. Initially, only one boy from each family was designated for this purpose, and then only if there were at least five sons. Later, however, this was no longer observed, but the government, in addition to the number of boys it deemed necessary, selected the fittest, and had no qualms about taking away even an only son. Even adults (at least those over fifteen) were sometimes conscripted. I need not dwell here on the misery brought upon the wretched parents by a system reminiscent of the fable of the Minotaur sacrifices. An eyewitness tells us that he saw mothers praying to God to deliver their sons by killing them on the spot. The institution did not apply to married sons; and therefore, it sometimes happened that children, even under ten years of age, were married off for the sake of convenience. But it was not long before the conscripting officers spared even these "married" ones. These blood edicts could be circumvented in only two ways. One was bribery, the other flight to the Venetian possessions in Greece. The latter, however, was abandoned when Venice lost its Greek provinces.

Now, one would think that such a shocking and recurring example of oppression would likely have led to rebellion. And yet, in the long list of uprisings against Turkish tyranny, we find only one (in 1565) attributed to that cause; and that was not even a Greek uprising, but an Albanian one. What is recorded in this regard is typical. As the Janissaries became increasingly pampered and powerful, many Greeks came to consider membership in that elite band a blessing rather than a curse. In the mid-sixteenth century, the Venetian ambassador to Constantinople wrote that the induction of children as future Janissaries was usually considered a special favor by Christian parents, guaranteeing their sons a comfortable and profitable position. There was even no shortage of Muslim parents who did not hesitate to lend their boys to Christians, so that they might share in the same fine privilege.

We, who view all this with entirely different eyes, lament it, because this preoccupation with male potential has resulted in an immense loss for both Christianity and Greece. When we remember that for two centuries the Janissaries were composed exclusively of Christian sons, that the Christian population of Turkey was mainly confined to the European provinces, and that the young men not incorporated into the elite army were generally the weakest, then we can imagine how heavily all this must have weighed on the propagation and development of Christianity in southeastern Europe. Moreover, the Janissaries, as is the case today with some African bodyguards, were prohibited from marriage. The modern Greek historian

63295 Paparrigopoulos calculates the number of Christian boys incorporated into the Janissaries during the first two centuries at at least one million. This does not alter the fact that this incorporation was abolished in the seventeenth century, or at least was no longer required. Several causes contributed to the decline of an institution that had long hardened the Turkish army, at the expense of the Christian population. First and foremost, the abolition of the marriage ban comes into consideration, as married bodyguards increasingly managed to force their sons into the "elite band." A second cause is the continued increase in induction through bribery. Furthermore, the Sultans likely came to distrust their bodyguards, in the same way the Roman emperors had done with the Praetorians. It is no wonder that they increasingly devoted less effort to a supplement. In addition, the decline in the Christian population also reduced the choice. Finally, the increasing unscrupulousness and indifference of the officers must also be taken into account. All this led to the complete abolition of the bodyguard in the nineteenth century, and already in the second half of the seventeenth century to the abolition of the forced conscription of Christians.

63300 Another reason for the adoption of Islam by many Greeks lay in the offices assigned to them at that time. When the uncivilized Turkish people saw themselves masters of a large and powerful European empire, they lacked all the ability, both financially and diplomatically, to maintain such an empire as required. Turkish arithmetic was

63305 terribly cumbersome, the Turkish language unsuitable for writing of any importance; and the Turks had the same weakness that we English still tend to have today: they understood no language but their own. Hence, they consistently entrusted the drafting of documents intended for foreign countries to Greeks who understood Turkish. Yet, it is undeniable that it is not linguists, but men of character who have a future as conquerors; and it is equally certain that the Greeks possessed precisely those qualities that the Ottomans lacked. It is therefore no wonder that the astute Mohammed II, who, as a rare exception, understood Greek, was convinced that the innate adaptability and acquired knowledge of his new subjects could be of incalculable use to him in governing his vast possessions.

63310 However, an undeniable difficulty arose. Almost all more or less learned Greeks had fled to Western and Central Europe after the fall of Constantinople; And it is to this that it is attributable that during the first two centuries after that fall, the Greeks generally did not advance beyond the ranks of scribes in the departments of Finance and Foreign Affairs in the Turkish service. However, there was a striking exception early on: the high post of Grand Vizier. Of the five Grand Viziers who served Mohammed II, two were of Greek nationality, the first of whom, Mahmud Pasha, was the first Christian to be entrusted with this high position. Under Bajazet II, we again find two Greek Christians as Grand Viziers, and under the great Soliman, two more. Later, even a son of a Pope was appointed to this position. The fearsome

63315 Barbarossa, the scourge of Christians at sea, was also of Greek descent. Around the middle of the sixteenth century, the Venetian ambassador to Constantinople could assure us that the most important positions in Turkish government service usually fell to Greek Christians, and that the Turks complained bitterly because the unbelievers had better prospects than they themselves.

63320 It took a long time, however, before these positions, with the exception of the very highest, could be obtained by anything other than conversion to Islam; therefore, the temptation to take that step was great. In Greece, however, the number of these converts was much smaller than in Bosnia and neighboring regions among Slavs and Albanians; And when (around the middle of the seventeenth century) the Turkish government began to become less strict in demanding apostasy, and even opened several important positions to the rayas, it was a great satisfaction for the Greeks that they could fulfill a laudable ambition without qualms.

63325 1) Horus, nicknamed Barbarossa, was a renegade and pirate in the early sixteenth century. He defeated the Dey of Algiers and became Dey in his place. Trans.

63330 The aforementioned lack of educated Greeks in the principal Turkish cities had ceased to exist; and the Porte took advantage of this by immediately granting the important post of Grand Dragoman to a Greek Christian, who managed to conduct the negotiations regarding Candia with the desired results. From then until the War of Independence, his successors were generally Greek Christians.

63335 Similarly, the important position of Dragoman of the Navy was usually filled by a Greek from the mid-sixteenth century onwards; and the island of Paros still possesses numerous reminders of the Mavrogenes family, two of whose members managed the naval affairs of the Kapudan Pasha (head of the Navy). One of this remarkable family, Nicholas, was elevated to the position of Feudal Prince of Wallachia (first half of

63340

the eighteenth century). For almost the entire eighteenth and early nineteenth centuries, the two thrones of Wallachia and Moldavia, which were more or less dependent on Turkey, were continuously occupied by Phanariotes (Greeks from Constantinople), and unfortunately, were all too subservient to their particular interests and desires.

Eighteenth-century sultans even seriously considered doing the same in Morea, but it remained limited to the elevation of that peninsula to a government under a Christian governor. Such elevations of Greek Christians were always very advantageous and pleasant for those individuals; however, as soon as the interests of the governed did not entirely align with the whims of the rulers, the latter usually carried the brunt.

But we lack the right to expect the virtues of heroes and saints in the offspring of men who, century after century, had groaned under the yoke of foreign rulers. Yet, while fully acknowledging this mitigating circumstance, we must acknowledge from the heart that the loss of Euboea and Crete, and other such terrible blows inflicted on Hellenism in Turkey, are primarily attributable to Greek Christians. Moreover, denial of nationality was commonplace in Turkey at the time, including among Albanians and Slavs (especially Bosnians and Serbs), who, like a multitude of Cretans, had also exchanged their faith for Islam and from that moment on, largely became the staunchest supporters of a regime that enabled them to oppress their fellow tribesmen. This is still often more or less the case with Turkish Greeks today, even when they are not Muslim. For example, in 1897, a Greek of this ilk did his utmost to thwart the interests of his fellow tribesmen when, as Turkish ambassador in London, he discussed the Greco-Turkish war. And so, even today, it is almost always men of Greek descent who are presented by the Porte to the Christian powers as models of impeccable statesmanship. And the island of Samos, with its Greek Christian prince at its head, can be considered a remarkable reminder of the time when the Sultans regularly sent out degenerate Greeks north of the Danube to subordinate the well-being of the inhabitants to their own interests and those of their feudal lord. Twice (once under Selim II, in 1514, and once during the early part of the Cretan War, in 1646) there was serious talk of exterminating all Christians in Turkey.

Fortunately, more sensible plans prevailed; so that even before the eighteenth century, the Porte had been intent on increasing rather than decreasing the number of Christian taxpayers. Not without reason, the Turkish rulers feared that their Christian subjects were slowly but surely disappearing; and that would be an insurmountable blow to Turkish finances. For much more could be gained from such a Christian dog than from a believer. However, to avoid driving the rayas to despair, the Nizam Jiddid (New System) was introduced in 1691, which ordered the provincial governors to levy no other tax on these people than the harash, i.e., poll tax. Aside from the blood tax for the Janissaries' replenishment, this poll tax had originally been the only standard Christian tax in Turkey. It had to be paid by all "unbelievers" over the age of ten, except for clergy, the elderly, the blind, the lame, and the maimed. Moreover, the import and export duties for unbelievers were double those for Muslims.

That, one might say, was oppressive enough; but from ancient times, and still today, the harshness of taxes in Turkey lies less in the legal amount than in the illegal collection. A pitiful example of this was provided in 1571. At that time, the Christian subjects of the Great Lord were driven to despair by extortion, while the vast majority were so poor and miserable that they shuddered to look a Muslim in the eye, imbued as they were with the realization that their oppressors would deprive them of everything that even remotely left them with their necessities. Bearing this in mind, the reader will realize that the introduction of the Nizam Jeddid, combined with the de facto abolition of the Janissary blood tax, allowed Turkish Christians to breathe more freely, and from that time on, examples of apostasy kept pace with the diminished temptation. The Venetians' conquest of Morea at the beginning of the eighteenth century crowned this salutary change, because, on the one hand, many who had more or less been forced to become Muslims now returned to the Church of their fathers, and, on the other hand, the Turkish government began to treat its Christian subjects better, for fear of comparing too unfavorably with the Italians. And it was not long before Russia's claim to patronage over the rayas contributed even more to preventing their apostasy.

It was however, not only in the number, but also in the quality of the population, the Greek provinces of Turkey had reason to regret their forced incorporation into the Empire of the Crescent. The vast majority of the highly cultured, almost all the notables, in short, the flower of Greek nationality—all of these, after the fall of the Byzantine Empire, had preferred voluntary exile. True, Mohammed II had a Greek

proclamation issued, addressed to the nobles of Morea, in which he promised to respect their families and property and to promote their prosperity; but this remained almost ineffective. So widespread was the emigration of families of any significance that only four or five of the Peloponnesian clans (if I may so call them), who had played a major role in the Middle Ages, remained in the land of their fathers; and in the rest of Greece, the situation was not much better. Since these "aristocrats" had a significant impact, this exodus was no less dangerous for the maintenance of Greek nationality than the emigration to America today, in which so many Greek peasants participate that the press in Athens, Patras, etc., is alarmed. It was natural that most of the aforementioned emigrants settled in the Venetian colonies on ancient Greek territory, which, as a result, became a thorn in the side of the Turkish conqueror. I will give a few examples of such emigrants here. Michael Ralles, one of the foremost Laconian (Spartan) Archontes, a champion of the Turkish-Venetian war, and the Daimonogiannes brothers, prominent figures, also from Laconia, settled in the Venetian possessions on the peninsula; And Palaiologos, who can be considered the last defender of Morea, entered Venetian military service. Yet other high-ranking Greeks accompanied Sophia, the daughter of another member of that famous family, which had last headed the Byzantine government, on her journey to Moscow, where she was to marry Grand Duke Ivan of Muscovy. As a result, the Muscovite court soon became a favorite residence of the prominent Greeks who had known her father and whose descendants, three centuries later, played a prominent role in or after the failed uprising that took place in Morea at that time.

A large number of Greeks, eager to fight the enemies not only of their own but also of their adopted homeland, volunteered to enlist as light cavalry of the Venetian commonwealth. The research of Sathas, a distinguished Greek scholar of our time, has shed all the desired light on this remarkable elitetroop. The name "Stradiotians," by which they are known, is not the Greek (= soldiers), but the Italian word "strada" (= road), with a Greek suffix—thus meaning "roadmen," i.e., men without a permanent residence. Composed of Greeks and Albanians (Arnauts), the corps drew its largest component from Laconia (the Mayonnais) and its bravest from Nauplia (Argolis). In the list of its commanders, we find names such as Palaiologos and others, once belonging to men who sacrificed their lives for the freedom of the Peloponnese. The golden age for the Stradiotians was the sixteenth century, when Europe resounded with the praise of their daring. A Stradiot even served in the English military under Henry VIII, for whom he achieved fame in Scotland and was rewarded with the command of Boulogne, then an English fortress. 2)

The Stradiots were also widely known in other respects, and not always with praise. Their boastfulness and vanity were a favorite subject of mockery in Venetian theatricals, just as Plautus of old entertained Roman audiences with the snarky antics of his Pyrgopolynices (in his comedy "The Boastful Soldier"). Thus, Tasso speaks of the rapacity of the Stradiots. Other poets, however, have sung their praises. It is certain that some of them made a name for themselves in science and poetry. Their name, especially as lyricists, still resonates well.

1) However, not runaways, nor vagabonds. 2) Only for six years (1544-1550).

Even today, some of these songs, written in a mixed language based on Greek, are still sung from time to time. Overall, however, the Stradiotians excelled more in their feats of arms than in their use of the lute. Their most formidable weapon was a long spear, equipped with a razor-sharp point at both ends, which made the weapon equally sharp from behind.

If it ever (which rarely happened) failed the rider, he had an effective substitute on his saddle—a club; and woe betide the skull on which that formidable object landed. How unfortunate that all that force and skill was usually directed not against Turks, but against Christians, who had the misfortune to stand in the way of the Venetians!

Even more lamentable is the fact that the classical soil of Greece also lost its centuries-old fame in arts and sciences when the Turks took control. All traces of higher education disappeared from the favorite seat of the Muses. Most literate Greeks emigrated to Italy; and, just as once, in the words of Horace, "Captivated Hellas knew how to captivate its conquerors," so, sixteen centuries later, it knew how to kindle the light of Hellenism in the twilight of Christian Europe. A few examples will suffice here. The Athenian Demetrius Chalcocondyles became the tutor of one of the sons of the great Florentine Lorenzo dei Medici, while Georgios Hermonymos, a Spartan, was the first Greek to openly teach his language in Paris. Two Peloponnesians, Demetrius Ralles, a learned warrior, and Isidore, who had distinguished himself as a theologian and also in the

- 63495 defense of Constantinople, spent the rest of their lives in Italy; and the historian Phrantzes wrote his chronicle on the island of Corfu, where he lived until his death under Venetian protection.
- 63500 We owe a great deal of our civilization to this fifteenth-century dissemination of Greek scholarship; but what Europe gained, Greece lost. More than two hundred years passed before that unfortunate country could at least partially compensate for the loss it incurred through the emigration of so many bright minds. Although they did their best to interest numerous influential men in the fate of their beleaguered homeland, the practical benefit was small compared to the irreparable loss their
- 63505 unfortunate fellow tribesmen had suffered in their persons. Had they remained in Greece, their influence would undoubtedly have been felt: they would have obtained important positions in Turkish service, which would likely have enabled them to alleviate the plight of their fellow citizens; and their example would, in any case, have prevented the majority of Greece from falling prey to the most lamentable
- 63510 ignorance for more than two centuries. In the absence of an aristocracy and literate people, the peasantry and the clergy (mostly the sons of farmers) now became the sole, or at least the most important, representatives of the Greek nation. And now we are faced with a remarkable phenomenon. Never before has Greece suffered such great losses as under the Turks
- 63515 (through apostasy and emigration); And yet, Greece, under foreign rule, never experienced a time when its descendants were so free from mixing with other races as in the long years between the Turkish conquest and the decisive war of liberation. There is no reasonable doubt that after the prolonged period of confusion that followed the fall of Frankish authority in Greece, even the Turkish government
- 63520 (because it was strong and decisive) was, to a certain extent, a true blessing for the vast majority of the Christian population. There is another important point. The settlement of foreign invaders, which had been commonplace during the centuries of Christian rule, now came to an end; and the natural consequence was that for nearly four centuries the Hellenic race remained free from foreign taint.
- 63525 Traces of the Franks settled in Greece were only of any significance on the islands; there was no longer any talk of Slavic incursions. And the Greeks who had remained loyal to the Orthodox Church never married a Turkish woman, while a Greek woman who married a Muslim was immediately excommunicated. Thus, an abyss remained between Christianity and Islam in Greece: and (miracle of miracles) there was harmony between
- 63530 Greeks, Bulgarians, Serbs, Albanians, and Rumenians. The irritability that otherwise alienated all these nationalities ceased under the Turkish system of government at the time, which tarred all Christians with the same brush, thereby causing them to regard each other only as fellow sufferers.
- 63535 In the Greek regions that obeyed Venice, intellectual development was certainly not great, but nevertheless much better than in Turkish Greece. For more than two hundred years, literally nothing was done there to teach the people even to read and write; and only in exceptional cases was it found that an archbishop who could properly write his name. Larissa was still the largest and wealthiest city in Thessaly; and yet it is a fact that a modern scholar who examined the archiepiscopal archives from
- 63540 that period was shocked by the barbaric Greekness of those records. It is even surprising that, in all those years, some literary work was occasionally done. Among the scribes of that period rescued from utter oblivion by Sathas, only four, not counting some theologians, belong to Greece proper. The first two of these soon emigrated to Italy, namely the learned Chalcocondyles brothers. The aforementioned
- 63545 Demetrius, of whom the aforementioned brother, provided critical editions of Homer, etc., in Milan, where a tomb was erected for him, while the other brother published a History of the Turks. The other two mentioned here were citizens of what was then Venetian Nauplia, and lived around the end of the sixteenth century, mostly in Constantinople. One of them (Zygomalas) wrote a History of Constantinople from 1391
- 63550 to 1578. Another historical work was more important. I mean the "Chronicle" by Dorotheos, later Metropolitan of Monembasia; the author was from Moldavia. This curious book contained the entire history of the world from Adam to the year 1629, and was later continued by others until the year 1685. Until very recently, this work was the only popular history book of the Greek people.
- 63555 Around the middle of the seventeenth century, some effort finally began to be made towards school education in Greece. This was thanks to the "Haggineion," a Greek school still existing today in Venice, which took its name from a certain wealthy Greek merchant, Haggines, who founded it in 1621. Just as the leading Greek merchants
- 63560 still do today, based in London and elsewhere abroad, the wealthy seventeenth-century

colony of such merchants in Venice also took a keen interest in the well-being and progress of their fatherland. To this end, spurred on by Haggines' example, they occasionally sent delegates to Greece, who were to promote the higher interests of the old country as much as possible by establishing schools and acting as apostles of the gospel of literary civilization. And so, as early as 1647, one of those Venetian Greeks founded two model schools, one in Joanina (now in southern Albania), his birthplace, the other in Athens, where, around the same time, Roman Catholic monks were also teaching the youth the very basics of science.
{Conclusion follows.}

GREECE UNDER THE TURKS. II

One would be mistaken to believe that the Greeks always patiently acquiesced to Turkish rule. The prolonged rule of the "Franks" had resulted in them becoming much more warlike than they had previously been; but the awareness of the crushing superiority of the Ottomans made them averse to rebellion if they could not count on foreign aid. In the immediate period after the conquest of Constantinople, it truly seemed that such aid would not be long in coming. The East expected a new Crusade; and the West was planning one. Georgilas, a Greek poet of the period, appealed to "French and English, Spaniards and Germans" to join forces for the reconquest of the new Byzantium. The many learned Greeks, who had been dispersed across a large part of Western Europe by the loss of that capital, attempted to rouse the rulers of Christendom to the fate of their remaining compatriots. This was particularly successful for Cardinal Bessarion, who was twice considered for the papal throne and who crisscrossed Europe with unwavering zeal in the cause of oppressed Hellenism. The popes of that era supported Bessarion as much as they could; and Pius II even temporarily relocated to Ancona, where the Crusaders were to assemble. But the death of that church prince in that famous seaport brought the great enterprise to ruin; And the crusade, for which such elaborate preparations had been made, ended in a miserable fiasco.

Meanwhile, war between the sultan and the Venetian republic had become inevitable. The Venetians, after all, were convinced that the great "infidel" conqueror would attempt to complete his Greek territories by conquering the colonies they had left on Greek soil. A pretext for hostilities was quickly found. An Arnautic (Albanian) slave, belonging to the Pasha of Athens, had run away with his master's valuables and had sought refuge in the city to the banner of Saint Mark flying in Methone. The Venetian commander of the fortress refused the extradition; whereupon the Turks, in turn, seized Argos, which had been handed over to them by a treacherous priest. Moreover, they burned down the area around Methone. No wonder the war party in Venice then got its way, so that in 1463 hostilities began on both sides. Bertoldo d'Este became commander-in-chief of the Venetian army, with orders to proceed to Nauplia and cooperate as much as possible with Admiral Loredan, while the famous Albanian Skanderbeg received ample support to create a formidable diversion in the wild mountainous regions of his native land.

The Venetian commander-in-chief received considerable reinforcement by opening the gates of the Cretan prisons and converting their forced inmates into soldiers. At the same time, he issued a proclamation calling on the oppressed Greeks to gain their freedom with his help. This call was immediately echoed by the Spartans, who took up arms under the valiant Michael Ralles, head of a renowned Lacedaemonian family. Sparta's example was followed not only by the indomitable Mayans, but also by the

Arcadians, commanded by Bua, the same Albanian who (strangely enough) had waged war against the Greeks nine years earlier. With united forces, Argos was soon recaptured; whereupon d'Este ordered the rebuilding of the famous wall that closed off the Isthmus of Corinth and had been destroyed by the efforts of Sultan Murad II. In the incredibly short time of fifteen days, that six-mile-long and twelve-foot-high wall, secured by a double moat and 136 small towers, was rebuilt by the combined force of approximately thirty thousand Greeks, Albanians, and Italians (d'Este's united army). However, prosperity was followed by adversity. In a battle near Corinth, d'Este lost his life; and Mahmud Pasha, the first Greek to hold the high office of Grand Vizier, led the victorious Turkish army, which had just put an end to the Kingdom of Bosnia, to the recently repaired enclosing wall of the vast peninsula. Fear gripped the hearts of the defenders when a battle-worn force, three times their own, prepared to besiege the great defensive structure. Without a fight, they abandoned the magnificent creation of their hands and sought refuge in the heart of the Peloponnese. Once again, the isthmus was stripped bare of defenses, and Argos was abandoned to the victorious Turks, who then vented their fury on the Venetian colony of Corone, whose leading members, dispatched to Constantinople, were sawn to pieces

by order of the Sultan. When the Spartans realized that the Venetians were abandoning them, they retreated to the inaccessible recesses of the southernmost headland, where the Turks tried in vain to lure them with offers of complete impunity.

63630 Yet Venice was not discouraged. Sigismundo Malatesta, the well-known founder of Rimini's cathedral, was appointed in d'Este's place, but his Peloponnesian campaign did not achieve much recognition. The grand castle of Mistra, now an imposing ruin, withstood all his efforts; and he returned to Italy with no other booty than the bones of Gemistos Plethon, a late philosopher, whose Neo-Platonic teachings he
63635 adored, and whose bones he had interred in his magnificent foundation at Rimini, where his own tomb stands beside that of the sage. Barberigo, the Venetian governor of the Morea, continued the war with even less luck than Malatesta. Disregarding the advice of Ralles, who was fully acquainted with the local situation, he decided to besiege Patras; and, attempting to repel a false sortie, he fell into an ambush and
63640 was killed. Even more unfortunate was poor Ralles, who fell alive into the enemy's hands and was speared by them. The pitiful remnants of the Venetian force retreated to Kalamata, where they were defeated once again.

Meanwhile, the Venetian fleet had been very busy cruising the Aegean Sea, conquering some islands, and plundering others. In 1466, Capello, the admiral, anchored at the Piraeus and landed troops to launch an attack on Athens. Since the conquest of that
63645 famous city, nothing had become known of it in the literary world of the rest of Europe, except what can be read about it in a fantastic description of it, written by an unknown person around the year 1460. I mean the Greek manuscript titled "Athens" Theaters and Schools," discovered much later in Vienna. Now, however, Athens once
63650 again briefly acquired a modest place in world history. Initially, the Turkish garrison drove back Capello's troops; but when they returned in larger numbers, they seized the city proper, massacred the Turks who stood in their way, and plundered the citizens. Capello, however, did not attempt a storming of the Acropolis; and when the Turkish commander showed no inclination to evacuate that famous citadel, he embarked
63655 again and landed in Argolis, where he learned of Barberigo's death. He then sailed to Euboea, where he soon died of heartbreak.

From that moment on, Athens disappears from the pages of history for well over a century. However, a Greek chronicle among the manuscripts of Oxford University, dated
63660 1606, reveals that Athens suffered horribly from the plague seven times between 1480 and 1554, and that the citizens regularly had to enlist their boys to support the Janissaries. Moreover, we know of three Athenian Metropolitans during that period; and a little later, an Athenian became Ecumenical Patriarch. The jealousy that Venice's power had inspired in the other Italian states prevented them from supporting the powerful republic in this unequal struggle; and when the new Pope,
63665 Paul II, though a Venetian by birth, showed little enthusiasm for combating the Crescent, the ambitious republic had no other armed ally than Skanderbeg, whose death (1468) placed Venice in the greatest straits. In the early years of the thirteenth century, Venice had established a foothold on the large island of Euboea; and later, it became its undisputed master. However, especially since the incorporation of
63670 Thessaly into Turkey, the Venetian colonists on Euboea increasingly became troublesome neighbors to the Turks. Their raids there became increasingly frequent; and on each trip, they kidnapped a number of inhabitants, some of whose places were taken by Albanian colonists from Thessaly. Added to the enormous nuisance the population suffered as a result was finally the formidable plague of plague; so it
63675 was no surprise when, on the island, now christened "Negroponte," one heard the common saying that only a good peace or a good war could bring salvation. This saying was all the less exaggerated because it included "a plague of Jews." Gradually, almost all land ownership on Negroponte had passed into the hands of these clever guests; consequently, the Venetian government finally prohibited any further land
63680 purchases by Israelites, raised their taxes, and prohibited them from keeping Christian slaves or serfs. Conversely, the executioner was regularly chosen from their ranks. Yet, all this was not enough. The island's Catholic rulers observed with ever-increasing distrust that their Greek Orthodox subjects here, as almost
63685 everywhere else, preferred Islam to the Church of Rome. From the perspective of the Italian rulers, we must admit that they were right, when, increasingly provoked by the growing Turkish threat, they refused to accept into their ranks a single non-Catholic comrade-in-arms, who, encompassing all Catholic islanders over the age of eighteen, armed them with sword or bow against the Ottomans. Even membership in the Council of Governors, previously open to the Greeks, was now taken away from them.
63690 Negroponte retained that sharply defined Italian-Catholic type until the Venetian government ceased to exist there. Only in a few other places, for example, Corfu, did the rule of that mighty republic take such deep root.

Such was the state of affairs when Mohammed II, whose armies had conquered Athens and almost all of Morea, began seriously to consider annexing the large island, situated so close to the mainland. Spies soon informed the Venetian government of the impending storm. From Cyprus, from Rhodes, and from wherever else, even from Burgundy, people sought help against the great sultan, who had already conquered so many Christian states and was now preparing to lose such an important island to Christendom. However, Venice was generally abandoned. When the going got tough in 1470, the Venetian forces proved unequal to the daunting task that awaited them. Muhammad II had carefully surveyed Negroponte beforehand; and now he carefully planned his attack accordingly. While a large Turkish fleet sailed there, he personally led the land army to the spot where Chalcis, the capital, was only just a stone's throw from the mainland.

It is separated by a very narrow strait. Land and naval forces arrived almost simultaneously at that famous spot for many centuries. The Venetian naval commander was not strong enough to effectively oppose the landing of the troops on the Turkish ships, or the construction of a pontoon bridge across the Euripus, which brought Mohammed and his men to the Negropontian shore. Shortly thereafter, Chalcis was besieged by land and sea.

For four weeks, the city was defended with all the courage of desperation by the Venetians and the majority of the citizens, and heavy losses were inflicted on the besiegers; but in the end, the commander's faintheartedness, combined with the treachery of some citizens, tipped the scales in the Turks' favor. The sultan had discovered (through treachery?) a weak point in the defenses; And when he stormed that point with all his troops, a furious battle that lasted for hours, in which even women and children participated, could not prevent the enemy from entering the city. They still did not surrender, but defended themselves for a considerable time behind the chains stretched across the streets. More than six thousand townspeople and soldiers paid for this with their lives; and when at last the garrison of the citadel surrendered, after having been solemnly promised their lives, that solemn promise was horribly broken. The lesser soldiers were flayed and speared alive, and the general was sawn to pieces. The remaining fortified points on the island soon surrendered to the Turks, who slaughtered the Italians and carried off the Greeks as slaves. The sultan, who had suffered enormous losses, was finally satisfied with his revenge and returned to Constantinople, congratulating himself on having dealt the formidable republic a blow unlike any it had ever received. This was also the sentiment of the Venetians themselves, who rightly described the news of Euboea's defeat as "the worst news that had ever befallen the republic."

That there was little enthusiasm in the city of St. Mark for the remaining defenders of Negroponte is quite natural, though it did not achieve anything. The commander, who had proven to be as unenterprising as he was heroic, was punished with lifelong exile. As for the Italian families of the island, who, having escaped the enemy's sword, had sought refuge in Venetian colonies or in the city of Venice—the fate of those people was pitiful. Many of them had lost everything; And there was no shortage of noblewomen, who had led a glorious life on Negroponte on large estates, the family's property from generation to generation, and who were now forced to live out the remainder of their lives in convents with meager government support. And yet, even in appearance, the memory of the Venetian era has not yet disappeared in the capital of this beautiful island: even today, the ramparts of Chalcis are adorned with the proud Lion of Saint Mark, and a citizen of that charming city will likely show you in one of its squares a large pile of stone cannonballs that served in the memorable siege. But since that sad event, although there have been no shortage of vigorous attempts at reconquest, Euboea has had no other masters than the Turks, until it finally, as for many centuries, once again formed an important part of the Greek homeland. Despite this heavy blow, the Venetians remained undeterred. Pope Sixtus IV successfully attempted to persuade the rulers of Naples and Cyprus, and the Order of St. John on Rhodes, to join a "holy alliance" in support of Venice against the Turks, who were being attacked by Persia in Asia, while the partners of the Holy Alliance would keep them busy in Europe. Now, the tide seemed to turn. The Venetian general Mocenigo plundered several Turkish-occupied islands in the Aegean Sea and bombarded Smyrna; so that Sultan Mohammed reluctantly agreed to make peace proposals. Venice would hear nothing of it; but now the promising alliance collapsed due to the defection of the King of Naples. He would grant Cyprus to no one but himself; And when he saw that Venice laid claim to that glorious island, he not only broke the alliance but even sided with the sultan. This is the first, but by no means the last, example of a Christian prince aiding the Muslims in fighting his fellow believers. It

was as if this treachery had no blessing; for the Venetian-Greek garrison of Lepanto (Naupactus) thwarted all attempts by the Turks, who finally transferred the battlefield to Albania, where the Venetians had some possessions. After a sixteen-year struggle, Venice, however powerful, longed for peace. In 1479, peace was concluded with Mohammed. Venice retained possession of the island of Aegina, Lepanto, and seven fortresses on the Morea, of which Nauplia, Argos, and Navarino are the best known. Thus, the republic retained possession of some important settlements in Greece; but the island par excellence (Negroponte) remained lost to it. This loss, however, was nothing compared to what the Greeks suffered. Venice's naval power was far superior to the Turkish; and to it it owed all its victories and conquests; but the poor Greeks had to pay for this all too often, just as, during the most recent Greek revolt against Turkey, the Greek population of Smyrna, for example, undoubtedly would have paid the price for the consequences of a possible bombardment. In the fifteenth century, thousands of Greek inhabitants were deported as slaves or little better from the fortresses and coasts contested by Venice; and thus these poor oppressed people often suffered no less from the Christians than from the Muslims. The sixteen-year war had proven that the Greek nation had not yet degenerated to the point of ceasing to produce champions of the highest caliber. One example is appropriate here: that of Maroula, the heroine of Lemnos, who deserves to be placed on a par with the noblest women of ancient Sparta. The island of Lemnos, belonging to Venice, had been invaded by the Turks; and its only city was besieged by them. Already the courage of the Christians began to fail when Maroula wrenched his sword and shield from her dying father's stiffened fingers, placed herself at the head of the islanders, and drove out the Turks. As a reward, she was given the freedom to choose a husband from among the most noble of the unmarried officers; and Venice provided a rich dowry. The twenty-year peace that followed the Venetian War was by no means a period of tranquility for the Greeks. Hardly had peace been concluded when a formidable uprising broke out on the central tip of the Morea Peninsula, the well-known Maina. The soul of this uprising was the chieftain Korkodeilos Kladas, after whom the nineteenth-century leaders who played such a significant role in the great war of independence seem to have been modeled. Kladas was among the last Peloponnesian chieftains who submitted to Mohammed II; and the shrewd conqueror had deemed it expedient to win him over, if possible, by granting him the fertile plain of Helos, bordering the northern border of Maina, as a military fief. While the highly debatable assertion that the Helots of antiquity derived their name from it is true, it is at least certain that Kladas resembled an old Spartan more than a Helot. The Venetians also attempted to win him over by appointing him captain of the Stradiotians mentioned in the first part of this essay; and as such he proved himself useful in the Sixteen Years' War. But it soon became apparent that a leader of irregular troops, who considers himself indispensable in wartime, is likely to become a bone of contention after peace is concluded. Kladas refused to acknowledge the cession of the Maina to the Turks. He secretly left the fortress of Corone, which remained in Venice; and the Maina became a safe haven for him. There he raised the standard of revolt; and soon gathered thousands of armed men around him. The Venetian rulers feared that the Sultan would suspect them of complicity and break the recently concluded peace. To this end, they captured Kladas's remaining relatives and demanded that the Mayonnais hand over the rebel leader to the Turkish governor of Morea. A large bounty was also placed on Kladas's head. However, the freedom-loving Mayonnais refused to betray their brave leader; and a Turkish army sent against him suffered a heavy blow. Unfortunately, heated disputes broke out between Kladas and Theodoros Boua, another rebel leader. The Turks did not hesitate to capitalize on this, penetrating into hidden corners where no follower of the Prophet had ever set foot. Yet, Kladas was their master. After a desperate and successful attack on a small Turkish force, he found safe refuge on a galley belonging to a Neapolitan squadron anchored in those waters. That ship landed him safely in Naples, where he received an excellent welcome from the king, who was worried about an impending Turkish invasion of the eastern coasts of the kingdom. Kladas now ceased to play a role in the history of his homeland; but in the chronicles from the Kingdom of Naples, we find him fighting alongside Skanderbeg's son in southern Albania in Neapolitan service. King Ferdinand later rewarded him with a generous pension, which passed on to his son. In 1489, a new revolt broke out among the Mayans; but a far more important event was unfolding around that time in southeastern Europe. Andreas Palaiologos, the eldest son of the last feudal prince (Despotes) of Morea (who was a brother of Byzantium's last emperor), had made vain attempts to obtain aid from the King of Naples in his

63825 attempt to regain his father's principality. He was more successful with the
 ambitious King of France, Charles VIII. In 1494, a solemn meeting took place in Rome
 between the Greek prince and Cardinal York, King Charles's representative. The result
 of the discussions held at that time was that Palaiologos transferred all his rights
 63830 to the Byzantine throne to His Most Christian Majesty. He did not do this for free,
 however, but in exchange for an annual payment of 4,300 ducats and a gift of lands
 whose annual yield was estimated at an average of 5,000 ducats. Furthermore, Charles,
 through the cardinal, promised to return to the other his fief (Despotate) of Morea
 if possible, in return for which Palaiologos pledged to present the king with a
 63835 magnificent grey horse annually on St. Louis's Day, as a form of feudal homage. In
 that same year, 1494, the French king marched on Naples, having sent ahead an
 exaggerated proclamation announcing his grandiose plans against the Turks, while a
 court poet made a point of sounding the prediction that "I pass, the man; then Greece
 enters, and we shall be acclaimed by the king by his progress."
 Shortly after entering Rome, the adventurous king came into contact with Prince Jim,
 63840 an older brother of Sultan Mohammed's successor, Bajazet II, whose throne he
 contested and by whom he had therefore been banished. Having resided in Rome for
 several years under papal protection, he had struck King Charles as a suitable lord
 to use for his purposes. However, nothing came of it. The wretch, who at the time was
 dishonoring the papal throne, had hastened to warn the Sultan; and this promised him
 63845 300,000 ducats if he ensured that Jim was "withdrawn from the misery of earthly life"
 as soon as possible. The shameful bargain was concluded; and shortly thereafter, Jim
 breathed his last, one of the victims of the terrible poisonous powder, the secret of
 which was held by the dear Borgia family.
 Meanwhile, fame had spread the brilliant and dazzling plans of the French king beyond
 63850 the Adriatic and Ionian Seas. Now that he had driven Ferdinand of Arragon from his
 kingdom of Naples, he was expected as a savior not only in southern Albania but also
 in Thessaly. Fear gripped the hearts of the Turks, and Bajazet considered crossing
 the Bosphorus with all his baggage. False alarm! Charles's comprehensive plans had
 aroused the jealousy of Europe's rulers; Venice captured the French chief agent and
 63855 forbade all ships in the ports under his control to oblige the French king. He made a
 virtue of necessity, returned to France, and abandoned the unfortunate Greeks, who
 had counted on him, to their fate, which was terrible for many because of Bajazet's
 vengeance. Such has been the usual outcome of Europe's many attempts to intervene in
 Greek affairs. *Quidquid deirant reges, plectuntur Achivi.* 1)

63860 The services rendered to the Sultan were not long enough to deter him from his plans
 for Venice's possessions in the Levant. As early as 1499, war flared up again. It was
 primarily aimed at Lepanto, so fortified by Venice that the Venetian historian
 Cappelletto called it "the principal stronghold of the Christian peoples in the
 63865 East." But to wrest Lepanto from the republic, the Turkish fleet had to force its way
 into the Corinthian Gulf, which was blocked by Venetian ships. A formidable naval
 battle took place in the open sea. Two Venetian captains boarded one of the largest
 Turkish ships of the line on either side; but the intrepid sailor in command set it
 on fire; and all three ships and their heroic crews were soon reduced to rubble. The
 remaining Venetian ships retreated to Corfu; the Turkish fleet sailed into the vast
 63870 bay; and Lepanto surrendered. To secure access in the future, Bajazet had the forts
 of Rhion and Antirrhion built at the point where the two shores were closest
 together, which are known as to cover the "Little Dardanelles."
 The loss of Lepanto compelled the republic to make peace proposals. However, the
 sultan imposed such exorbitant conditions that the war resumed with renewed vigor on
 63875 both sides. Bajazet personally presented himself as head of the land army; and
 already in the following year (1500), a second Venetian fortress, the formidable
 Methone, fell to the Turks after a stubborn defense, who slaughtered almost half the
 population. Corone and Navarino surrendered at the first requisition. Since the loss
 of Euboea, no such heavy loss had befallen the Venetian authorities in the East.
 63880 Methone, in particular, was greatly deplored, as this now-insignificant seaport,
 according to a Venetian archival document, was "the refuge par excellence for our
 galleys and other ships on their way to the Levant." Methone and Corone were Venice's
 oldest possessions in Greece; but the Doges and their councilors had the unfortunate
 habit of exploiting these two important assets to the fullest, simply to free up
 63885 funds for other ventures. And so it came about that, in the Lagoons, it was realized
 too late that if an overseas territory is valuable to the mother country, it must
 also be given considerable money. Regarding Methone specifically, Sultan Bajazet
 valued this acquisition so highly that he implemented a peculiarly practical measure:
 all the Peloponnesian cities were each required to surrender five families, who would
 63890 form the core of the new population. Stirred by this example, Venice soon after did

something similar: when, with the help of Spanish troops under the famous Gonsalvo de Cordova, it wrested Cephallonia from the Turks, it granted new settlements on that rather large island to the refugees from Methone and Corone.

It was fortunate for the Venetians that the sultan rested on his laurels, so that in 1502 they conquered the island of Santa Maura (Leucas) without much difficulty. The following year, peace was concluded, stipulating that Venice would retain possession of Cephallonia but return Santa Maura. The overall outcome of the war was disadvantageous for both the Greeks and the Italian Republic. This was also evident, among other things, from what happened to Megara. This ancient city was quite important at the time as a foraging point for the Turks; But precisely for that reason, it suffered so much from the Venetians that its population almost disappeared, only to be gradually revived by the influx of Albanians.

For more than thirty years, Greece was no longer a theater of war for the Venetians and the Sultan. Both sides had their hands full elsewhere: and so it was that the Doge even congratulated the famous Soliman the Magnificent on the sad fact for Christendom that the Turk had wrested the island of Rhodes from the Knights of St. John. In Greece, things were calm, and the population recovered somewhat from the formidable blows they had suffered; but the well-meaning exhortations of some popes, combined with the patriotic eloquence of Greek exiles like Lascaris, failed to rouse the European rulers to a new Crusade. Emperor Charles V was not the man to liberate Hellas as a tribute to the memory of those great men of antiquity, whose names Lascaris so eloquently invoked. This scholar and ardent patriot lies buried in Rome, as does that other great advocate of the Greek cause, Bessarion. What a pity that reborn Greece is not endowed with a Pantheon, where the remains of its noble exiles may finally rest in free, native soil!

In 1531, Methone was besieged again, this time by the Johannites, who contented themselves with plundering. Of far more significance was an invasion of the Greek coasts the following year, when Emperor Charles waged war against the sultan. Charles, who cared far more about harming the Turks than benefiting the Greeks, contented himself with sending a fleet under the renowned Genoese Andrea Doria to the Levant. A series of rapid victories justified the trust placed in him. Corone, for example, was taken with the cooperation of the population; but the emperor, realizing he could not sustain such a remote possession in the long run, offered it to the Johanniters. When they declined this difficult offer, and the sultan prepared to besiege Corone, Charles turned necessity into a virtue and decided to have the entire population of the city relocated. This came as a thunderbolt to those poor people (mostly Albanians), especially since the plague had broken out among them. Yet, it seems the vast majority embarked on imperial vessels.

They embarked, where many of them succumbed to the plague. When the survivors were brought ashore in Messina, they looked so miserable that the terrified citizenry did not rest until they were transferred to the hospital. The few who survived all this moved to Naples, where the emperor granted them an annuity, as well as some dispensations, such as the use of an Orthodox (Greek) church. Out of gratitude, they enlisted as imperial Stradiotes, in which capacity they displayed a heroism that would have served them well had they gone into battle against the hereditary enemies of their homeland.

Meanwhile, Doria continued to make the sultan tremble. For example, he forced the Turkish garrison of Patras to surrender and seized the two forts dominating the aforementioned "Little Dardanelles." Deceived by his pretenses and blinded by his victories, the Greek population revolted; and all the Turks they could find were slaughtered. Alas! this cost them dearly. It was not long before the Genoese naval hero departed, leaving his Greek allies pitifully in the lurch. They paid terribly for their momentary blindness: and they were fully justified in praying: "Lord, deliver us from our saviors!"

In 1537, Soliman declared war on Venice; and hostilities began with the siege of Corfu, one of the mainstays of Venice's power. Although the Turks lost their lives to that important fortress, they inflicted considerable damage on their enemies in the Levant. The Turkish fleet, led by the notorious pirate Haireddin, nicknamed Barbarossa, a man of Greek origin, visited one Greek-Venetian island after another, leaving burning villages, destruction, and misery in its wake. Even the Ionian Islands were not spared his chastisement, after which he skirted the Morea and unexpectedly appeared before Aegina. At that time, the ancient and renowned capital of that wealthy island was uninhabited, and the population, fearing the pirates, had built a new city on a nearly inaccessible rock, which is still full of ruins to this

day. For Haireddin, this new city also proved to be accessible. Everything became his prey; the adult males were murdered without exception; and the women and children were mercilessly carried off as slaves. There were more than six thousand of them! So steadfastly and meticulously did the victors proceed that a French nobleman, who visited the unfortunate island with a French squadron not long afterward, found literally no one there. As for Morea, the Turks had laid siege to Nauplia (Napoli di Romania). This important port city defended itself heroically. The besiegers had planted their artillery on a nearby hill, where today a prison seems to cast a piteous glance at the city below. But despite the multitude of bullets that threatened the garrison and civilians, there was not a moment's thought of surrender; and finally, the siege was lifted. Until then, Venice had stood alone, and the sultan had found an ally (at least nominally) in Francis I, who had signaled a pro-Turkish policy, which later had an undeniable influence on the much-discussed Eastern Question. Now, however, Pope Paul III succeeded in forging an alliance between the emperor, Venice, and himself. Corfu became the gathering place for the Triple Alliance fleet; from there, they sailed to the Gulf of Arta (Ambracia), where sixteen centuries earlier the Battle of Actium had decided the fate of the Roman Empire, and where the red-bearded buccaneer was now prepared for a naval battle. Unfortunately, command of the allied fleet had been entrusted to Doria, who, however capable and brave, was jealous of Venice as Genoa's sworn enemy, and from whom no great effort could therefore be expected. No wonder, then, that Haireddin won an easy victory, and that the unworthy alliance collapsed.

Thus, Venice was once again forced to fend for itself. More or less at the Sultan's mercy, it concluded a peace treaty with him in 1540, surrendering Nauplia and Monembasia (Malvasia), its last possessions in the Morea. What a humiliation for the proud Lion of St. Mark, now that he had to withdraw completely from the Greek mainland, where he had been ensconced for almost three and a half centuries! Aside from the Ionian Islands and half-Greek Cyprus, nothing remained of all his Greek possessions except Crete and two insignificant Cyclades (Tenos and Myconos). The loyal population of Nauplia and Monembasia was transferred to Corfu, where they formed a significant part of the citizenry, and where the name of the town of Stradioti still keeps alive the memory of that great migration.

The disappearance of the Venetian flag from mainland Greece deprived the inhabitants (or at least the vast majority) of their last refuge. Most of their leaders, following the example of Michael Ralles, had found a safe haven in Venetian territory (Crete, Corfu, etc.). While there is no shortage of examples of Greeks who placed Turkish rule above Venetian rule, it is nevertheless a given that the Greeks of that time were wont to do as Westerners promised them liberation from the Turkish yoke. Before 1540, the Venetian settlements in the Peloponnese certainly had the advantage of making those regions accessible to Western civilization; But on the other hand, the sorely tried country had at least enjoyed relief since 1540, after the unrest and disasters of the clashes between the Cross and the Crescent. Among the Turks, dull monotony reigned, but at least tranquility; and that tranquility served to hold together, if not strengthen, the disparate elements of Hellenism.

During the first thirty years after the disappearance of the Venetian banner from Morea, the Greek mainland was quiet, although some continued to eloquently advocate on its behalf. The fall of the Duchy of Naxos in 1566 and the expulsion of the Genoese from Chios by the Turks that same year further diminished Italian influence in the Levant; but it was not until Selim II attacked the Venetian island of Cyprus in 1570 that the Greeks once again witnessed a momentous struggle. The first military operations were directed against the coast opposite Corfu and against a fort the Turks had recently built to control a natural harbor near Cape Matapan. The Turkish galleys under the protection of this fort could probably bombard the ships sent by Venice to defend Cyprus. Thanks to the help of the Mayots, always ready to vent their wrath on the Turks, the Venetians succeeded in capturing the fort in question. Unable to hold it, they destroyed it and then sailed to the island of Andros, whose Greek population, however, suffered even more than the Turkish garrison from the excesses of the Venetian visitors.

Meanwhile, the powerful republic had done its utmost to forge an alliance against the Sultan. Consequently, in the spring of 1571, an alliance was concluded between Pope Pius V, the Spanish King Philip II, and the Republic, aimed at the destruction of the Ottoman Empire. This was now the thirteenth time that a "Holy Alliance" with the same goal had been announced to the world. Now, however, it seemed that it would finally achieve its goal. A colossal fleet was assembled, commanded by Don John of Austria, a bastard son of Charles V. However, almost five weeks before that Armada left the Sicilian coast, Cyprus had already fallen; and, while the allies were not yet fully

in agreement on their plans, the Turkish fleet had already ravaged the coast of Crete and carried off more than six thousand people from Cephallonia.

It was not until the morning of October 7 that a naval battle broke out. The Turkish fleet commander awaited the enemy off Lepanto, while the Christian fleet lay at anchor outside the Corinthian Gulf near the Echinades (a group of islands near the northern coast). Ali, the Turkish admiral, against the advice of wise men, left his favorable mooring and sought out the enemy, who did the same. They met a good distance west of Lepanto. It was a striking spectacle. A brilliant sun reflected off the colorful Turkish ships, off the steel armor of the Christian warriors, and off the calm waves, where almost two thousand years earlier a bloody naval battle had taken place between Corinthians and Corcyraeans. The Christian warriors numbered approximately 30,000, the Turks some five thousand fewer. Several Venetian galleys were commanded by Greeks, including two Cretans. But the foremost among the Greek naval heroes, indeed the jewel of the entire Christian fleet, was Kondokallis, a scion of Corfu.

Parata, a Venetian historian of the time, unequivocally awards the palm of honor to all the Greeks who participated in this unforgettable naval battle, specifically in three respects: daring, skill, and discipline. So, precisely the three essentials. To sugarcoat the pill a little for his Italian readers, he adds that the Greeks are more accustomed to naval warfare than the Italians and Spanish.

The Turkish defeat was crushing. Well over two hundred ships were captured or destroyed, and nearly thirty thousand men were killed, compared to fifteen ships and eight thousand Christian deaths, among whom, however, were numerous prominent Venetians. Among the Turkish dead, I mention only the commander-in-chief. Among the wounded was the world-famous author of "Don Quixote," who, like Aeschylus at Marathon, had his hand severed, also for Greece against the Barbarians.

The first impression of this tremendous defeat was so crushing that Sultan Selim did not eat any food for three days. And no wonder. The Turkish fleet (one of the largest in the world) was destroyed; the Greeks became rebellious; and a coolly calculating French diplomat expressed his conviction that the allies could have conquered Constantinople with little difficulty. But the disunity of those allies and the spirit of Sokolli, the Grand Vizier, were the salvation of the venerable Turkish empire. Eight months after the "Battle of Lepanto," a new fleet sailed out of the Dardanelles, numbering 250 ships, fifteen of the largest of which were a gift from a wealthy Greek merchant, a citizen of Constantinople, known to his tribesmen as "Son of Satan." And Sokolli rightly said that Venice had shaved off the sultan's beard, but that he (the Vizier) had severed an arm of the republic (referring to Cyprus). The Battle of Lepanto threw the world into turmoil; but as far as the Greeks were concerned, it would have been better if that bloody victory had never been won. With enthusiasm, those unfortunates had awaited the arrival of the Armada, which would free them from the hated yoke; The intoxication of their magnificent victory prompted

them to take up arms, urging the victors to support the rebellion on the Morea with their fleet, which had proven irresistible. But, as usual, everything was now also ruined by a lack of unity among the allies. They soon held a major council of war aboard the admiral's ship; but Don John proved to be little more than a trooper in the face of the prevailing discord. One advocated a grand naval display along the Peloponnese coasts, another an attack on Euboea, a third a similar attack on Santa Maura (the only of the Ionian Islands that belonged to the Turks), while a fourth advocated an attack on the forts of the "little Dardanelles." Ultimately, they did nothing, because "winter was approaching," and they retreated to Corfu, from where the Spanish and papal ships sailed further west. Meanwhile, many Peloponnesians had crossed the Gulf of Corinth and, in the port town of Galaxidi (south of Delphi), joined a large contingent from Salona (ancient Amphissa). In the church of Galaxidi, these patriots swore an immediate, mortal war against the Turks. But among those who took part in this most solemn oath was a traitor who secretly crossed the Gulf and revealed the plot to the sultan's henchmen. Seething with anger, the sultan then took

revenge on the poor Archbishop of Patras, who was burned alive. Unaware of this, the rebels, three thousand strong, marched north of the Gulf of Corinth toward Salona, then a relatively important city. Instead of the expected "Frankish" aid, they found access to that fortress blocked by Turkish troops. The wily Bey, who resided in Salona, had them kindly invited to come and openly plead their grievances before him. They fell into a trap. Eighty of them were sent to the Bey, who received them with honors and listened to them with great sympathy. But hardly had night fallen when he had all the delegates thrown into the castledungeon, where they were soon executed, with the exception of a priest, who owed his survival to the strength of his fists.

64090 The rebels who had remained outside now crossed the inlet again; and with many reinforcements, they found refuge in the Maina, where not long afterward the two Melissenos brothers from Epidaurus gathered an army of 28,000 men under their banners, and with them bedeviled the Turks in that almost inaccessible region for two whole years. Don John, who led an idle life in Messina, was reluctant to resume his command, as Spain became increasingly at odds with France. Therefore, he wrote a

64095 letter to one of the two heroic brothers, urging him to keep the revolt going until the liberators' fleet arrived. He did not rush: it was not until August 1572 that he resumed command of the allied ships. Off Messenia, they encountered the Turkish fleet; but no engagement took place. Attempts to capture Methone and Navarino were unsuccessful to seize; and when the season was already too far advanced, they

64100 retreated westward. The broken rebels held out for a short time in the recesses of the Maina; but finally they abandoned their desperate resistance and were accepted with favor after the Melissenos brothers fled. In the city of Naples, both found an excellent welcome and, after their death, a tomb.

64105 Before the summer of 1573, peace was restored between Venice and the Sultan. The republic resigned itself to the loss of the beautiful island of Cyprus; and for its immense sacrifices of blood and money, the meager laurels of Lepanto were its only compensation. As for the Turks, it soon became clear that they knew how to capitalize on the lessons of experience. They built a strong fortress that guarded the entrance to the Bay of Navarino and also fortified the Peloponnesian coast at many other

64110 points. In another way, the disappointed Greeks demonstrated that they had become wiser. A letter from the Venetian ambassador in Constantinople, which has come down to us, reveals that the sultan distrusted the Grand Duke of Muscovy as a designated protector of his Greek Orthodox co-religionists. This letter is dated 1576; and it also reveals that the Greek subjects showed a willingness to place themselves under

64115 Muscovite protection in order to escape the Turkish yoke. The shadow of the Russian bear became increasingly visible, while that of the Venetian lion faded.

February 13, 1855 DESCRIPTION OF CRIMEA.
(Taken from the work "De Oorlog," which is continually published by H. NIJGH, Rotterdam). The Crimean Peninsula, which stretches so gracefully and elegantly into the Black Sea on the map, is divided by nature into two completely different parts: the beautiful southern coast, which can be called a true paradise, and the lonely steppes of the north. Crimea is connected to the mainland only by the narrow Isthmus of Perekop; this strip of land also forms the boundary between the Sea of Azov and

64120 the Black Sea. The entire circumference of the peninsula is 140 German miles long and its area is 360 square German miles, making the area of Crimea slightly larger than half the area of our homeland.

64130 To the east, the Kerch Peninsula, which borders the Sea of Azov to the south, extends to the Taman Peninsula, which belongs to Caucasia, from which it is separated by the Kerch Strait or Kaffa Strait. Behind that eastern point, near Kaffa, rises steeply from the sea the Tauric or Jaila Mountains, a continuation of the Caucasus. This mountain range extends along the entire southern coast of Crimea and spreads northward in several parallel arms, covered with forests that gradually disappear

64135 into the flat, uniform steppes that make up most of Crimea. But this southern mountain range, crowned by the Shadir-Dagh, which rises 4,740 German or 5,812 English feet high, is, especially on the seaward side, one of the most beautiful and charming places in the world. The valleys, which partly wind their way to the heights like narrow rocky paths, partly widen into mountain gorges or form meandering valleys, are crisscrossed by small rivers and streams, everywhere cascading and foaming down, and adorn themselves with all the splendor of tropical vegetation, under the influence of the softest and most pleasant atmosphere, as the high mountains prevent the harsh north winds from penetrating further. Picturesquely nestled in the depths or clinging to the rocks, the Tartar villages here reveal a

64140 Greek monastery, while there a mosque with its tall, spindly tower is visible. Steep rock faces alternate with gentle slopes, where lush green pastures are covered with numerous cattle; Charming Swiss houses form a striking contrast to the ruins of castles and towns from centuries gone by, while the eye rests with pleasure on the magnificent estates and castles of Russian nobles, wreathed by olive trees, fruit trees, and vineyards. Corn and tobacco sprout in abundance from the fertile fields; grapes grow luxuriantly on the rocks, brought here from Burgundy and Champagne, or from the banks of the Rhine, or from Hungary, Spain, Portugal, Madeira, and their vines gracefully twine around the tall trees. In the gardens, the gaze is treated to an abundance of fruits: melons and figs, almonds and oranges; while flowers from all

64150

- 64155 quarters display their colors and fragrances, and myrtle and cypress trees arch their dark foliage over them. Opposite this so richly blessed place, which in Russian bears the name of Juschnoi-bereg and which is teeming with towns, villages and pleasure gardens.
- 64160 The northern part of Crimea stands out bleakly. Here one finds a continuation of the Nogai steppe, which covers the entire southern Russia from Astrakhan to Odessa. There is little water and almost no trees; only in exceptional cases is the land cultivable, and then only where the steppe is covered with dense grass; but usually, the soil is only sand or sparse grass; the numerous salt marshes found there prove that the sea once washed over these plains; in winter it is bitterly cold and in
- 64165 summer scorching hot.
- Crimea has a population of approximately 300,000. More than two-thirds of this population consists of Tartars, the remainder of Russians, Greeks, and many German colonists. Although the climate is generally quite healthy, fevers are frequent; foreigners are especially susceptible to them. The Tartars, on the other hand, know nothing of it, but they suffer from dropsy, gout, and smallpox, as they have not yet learned to vaccinate their children.
- 64170 The capitals of Crimea are Sevastopol, Simferopol, and Bacchus.
- 64175 Sevastopol, which has now acquired European fame through the siege, lies on the southwestern tip of the peninsula. This seaport was founded in 1786, during the reign of Catherine II, on the site previously occupied by the Tartar village of Akthiar, and in the last twenty years has become one of the strongest fortresses in the world; it soon became the major base and staging area of the Russian navy in the Black Sea. A promontory points out the harbor to sailors from afar. Once one has rounded the
- 64180 reef-fringed promontory and reached the narrow channel at the entrance to the Bay of Sevastopol, one finds oneself an hour's distance from the city, recognizable from afar by a few white limestone cliffs and situated on the right or southern shore of the bay, which extends two hours inland, west to southeast.
- 64185 In the crooks of the partly rocky mountain range that surrounds this bay, itself an excellent anchorage, on all sides, lie five inlets, each forming a natural harbor basin; these include: the quarantine harbor, the artillery or arsenal harbor, the small war port or naval arsenal harbor, and the shipyard or calf dock. These natural harbor basins are deep enough for the largest ships, and the steeply sloping rock
- 64190 walls that surround them facilitate mooring. The bay is exceptionally well protected by the heights that enclose it; other, even higher mountains rise further up; the slope near the large naval port is so steep that at a certain distance one can no longer see even the masts of the largest warships.
- 64195 The city, which rises amphitheater-like, was poorly fortified on the landward side before 1852 and dominated by the surrounding heights; but since then, with astonishing effort, these heights have been partially leveled, and the city has been surrounded by a rampart or rampart, fitted with casemates. These casemates are bombproof vaults, built of stone, in which the artillery is housed; earthworks, lunettes, and several batteries have also been erected on the landward side.
- 64200 Sevastopol, however, is especially strongly defended on the seaward side. All the protruding points on both banks of the bay are covered with stone forts or fortified batteries. There are twelve of them in all, six of which are located on the southern and six on the northern bank, almost opposite each other. The artillery of these fortifications, consisting of approximately 1,350 guns, covers the entire bay, from
- 64205 the buoys out to sea, and can be positioned in such a way that a fleet attempting to approach the roadstead by force would have to cover a distance of approximately 3,000 feet under a threefold, extremely intense crossfire.
- In addition, there are a number of batteries scattered here and there. On the heights to the north lies a strong star redoubt, called the Noorderfort (Northern Fort),
- 64210 which commands the beach on that side. On the south side, an important fortification, the rond fort, protects the city. A mile and a half from Sevastopol lies a fortified camp. Finally, on the opposite side of the maritime establishments and the artillery park, four more fortified barracks are found. As one approaches the entrance to the bay or channel, which extends about four cable-lengths wide between the reefs of the
- 64215 northern and southern shores, the fortifications of Sevastopol present a truly formidable sight. Starting from Cape Constantine on the northern shore, one first encounters a battery armed with 17 guns and barbettes, called the Telegraph Battery; nearby, at the end of the headland lies Fort Constantine, armed with 104 guns; next comes Fort Katharina, armed with 120 guns, then a smaller battery with 30, and
- 64220 further inland, a battery with 34 guns. Behind this second battery rises the Noorder-

fort, armed with 50 guns. The Russian fleet anchors between this second battery and Forts Nikolaas and Paul, located just below the city, of which the former has 192 guns, the latter 80. Now returning seaward along the southern bank, one first comes to a battery on the left edge of the city, with 50 guns, then Fort Alexander, armed with 64 guns, which, unlike Fort Constantine, located opposite, guards the entrance to the bay, and finally, the Quarantaine fort or battery, situated closer to the sea, with 51 guns. All these forts and batteries are equipped with casemates. However, the fortifications are not, like those of Kroonstad, built of granite, but of sandstone. It is calculated that the costs for the construction of these fortifications and those spent on the repair of the military buildings, the water supply, and the harbor works totaled two hundred and fifty million guilders.

The city itself, as we mentioned, is situated on a slope: the lowest part is 20, the highest built-up point 150 feet above the sea level. The entire length of the city is 1,200, the width 400 paces. Before the outbreak of the last war, the population amounted to approximately 40,000 souls, of which the numerous garrison of the navy and land forces and the various personnel constituted three-quarters. In the city's innermost part, one finds the magnificent Greek church, the lavishly furnished library, and the market; In the lower section: the large admiralty building, the arsenal, and other maritime establishments; opposite these buildings, on the other or right bank of the small or southern naval port—whose entrance is protected by Forts Nikolaas and Paul and by a submarine chain—the docks, the naval hospital, the extensive warehouses, and the troop barracks form a kind of suburb.

The vast docks, located behind Fort Paul, were constructed according to the plans and under the supervision of the English engineer John Hupton; the basin is supplied with water by a water conduit, ten versts long, connected to the Chernaya Rechka stream, or Black Stream, which itself flows into the Bay of Sevastopol. In addition, there is a reservoir into which seawater can be pumped by means of a steam engine. Sevastopol is built evenly on the uneven, bare, white, chalky soil; but the city is difficult to navigate and, apart from the main street and the magnificent steps along the quay, features only insignificant squares and alleys, and, apart from the rural buildings, only insignificant houses. The quays, however, are magnificent and lined with pillars and granite parapets. Although situated very close to the most beautiful part of Crimea, Sevastopol does not enjoy the favorable climate prevailing there. The mountain range, which blocks the north winds, begins to descend towards the west and, around Sevastopol, presents only barren and stony heights, which do not rise high enough to completely protect the city. However, the cold is less severe there than in the central Crimea, and the harbor remains open in winter. In summer, the sun beats down on the white stones, while the wind stirs up clouds of sand and dust. Overall, Sevastopol does not make for a pleasant place to stay.

The neighboring quarries of Inkerman, formerly a Genoese fortress but now a small town, provided the materials for the extensive works undertaken in Sevastopol. The old town of Inkerman was situated at the end of the large bay or nave of Sevastopol, near the mouth of the Chernaya River; the new town, recently destroyed by the Allies, contained two churches, a beautiful, wide main street, and a fine quay; also warehouses, barracks, and a few shops. It was built by the Russians around 1790, and the excellent harbor where it was situated—this harbor, here called Inkerman Bay, with a depth of between 21 and 70 feet and where the largest ships could anchor within a cable's length of the beach—promised a brilliant future for it. However, Inkerman never rose to the important position it could have achieved: merchant ships were, by a strange provision of the protective system, kept out of the port unless they were in distress, and as a result of this foolish law the commercial spirit among the inhabitants was completely extinguished, and Inkerman, which would otherwise have become a flourishing commercial town, declined into a small, insignificant town.

The environs of Inkerman enchant travelers. It is indeed a city of caves, for in the white cliffs that overhang the Bay of Aktiar or Sevastopol, a multitude of strange grottoes are found, partly naturally formed, partly carved into the hard rock, revealing chambers with Gothic window arches, chapels with altars, monastic cells, and burial vaults. These caverns are believed by some to be the refuge of Christians during their persecution; but they, like the ruins of the old city, among which various remains of Greek architecture can still be found, were not spared by the Russian soldiers.

The second city of Crimea, Simferopol or Akmeshed, lies further inland, at the northern end of the mountainous region, not far from the source of the Salghyr River, and has 3,000 inhabitants. The foundation of this city is of more recent date, and it therefore boasts straight, wide streets and many attractive houses, their facades

adorned with columns.

- 64290 February 14, 1855 DESCRIPTION OF CRIMEA.
(Taken from the work "De Oorlog" (The War), which is continually published by H. NIJGH, in Rotterdam.)
(Continued from No. 44.)
- 64295 But infinitely more important for the lover of antiquities and history is Bakchisarai, the capital of the former Tartar Khans, situated between Simferopol and Sevastopol. Bakchisarai is a garden in Tartar, and Bakchisarai means: the Serail or the palace of the gardens. This city is one of the most peculiar that one can see; It lies in a narrow valley and, from a distance, with its numerous minarets, incredibly tall chimneys, and no less tall poplars, resembles a forest of nothing but turrets.
- 64300 The houses, trees, and gardens still cover a small portion of the surrounding rocks, the uppermost of which presents a steep, bare, light-gray limestone cliff. Here, for several centuries, was the headquarters of that important state, the last remnant of the Mongol Empire in Europe, that state which, from the Crimea, extended its authority over the lands through which the Dnieper and Dniester rivers meander. Here,
- 64305 where the mountains border the steppes, was the abode of those mighty khans, before whom Russia's czars trembled even in the 17th century, whose friendship the Poles, Russians, and Turks alike flattered, until Catherine, the brave and cunning, finally conquered and drove them out. Even today, the Tartars, who have remained faithful to their mountains since the destruction of their empire, cherish a great fondness for
- 64310 the old capital, which still displays a shadow of its former grandeur. The Khan's palace is still standing, and the population, except for the few Russian officials, consists entirely of Tartars. No one belonging to another nation is even allowed to live in the city; among the 14,000 inhabitants, only 2,450 are Russians. Bakchisarai can therefore rightly be considered a remnant of the old Tartar empire. The city is
- 64315 lively; its numerous inhabitants love music and song; sybals and timpani resound through the exceptionally long main street, which runs between the rocks and is divided into two almost equal parts by the old Khan's palace. This single main street is more than two versts long, yet extremely narrow; It is where the trade and commerce are concentrated, not only of the city itself, but also of the entire
- 64320 western Tauride region. The shops are filled with all the products of Tartar and Turkish art, and here and there one sees the workshops where all these things are made. The small, tightly packed houses have almost no windows, yet the entire facade, consisting entirely of wooden shutters, can be opened. These shutters are partly removed, partly lowered like tables projecting over the street, and one sees the open
- 64325 houses, as if in cross-section. The residents perform their various tasks before the eyes of the public: here a baker is busy preparing his bread; there the bussa, that beloved Turkish drink, is being produced; further on sits a tailor with his companions; There again, the vapors and aromas of a soup kitchen spread, where one can enjoy one's midday meal as one passes by; or one delights for a moment in the
- 64330 contemplation of the fantastic spectacle presented by yonder forge, where a Gypsy or pagan family works valiantly, illuminated by the bright reflection of the flames kindled by the mother with the bellows and splashed by the playful sparks that leap from under the father's hammer. In the shops, merchandise is displayed for the eye, and one is most drawn by the ornate saddles and harnesses, and the beautifully woven whips, with their handles of silver wire and red morocco; in the tobacco shop finely chopped herbs are piled high in the streets, and beautiful pipe stems hang for sale; the fruit shops boast the treasures of the neighboring valleys, while finally, the covered galleries of the coffee houses, which stretch along the street, are bustling all day long. The street itself is teeming with Russians and Tartars, while the
- 64340 slender, elegantly formed mountain dwellers are quickly distinguished from their brown, plump brethren from the plains. Here, the white turban of a Hadshis is visible, for even from these far northern regions, a pious pilgrim sometimes makes the pilgrimage to the holy Mecca. There, again, a Tartar woman, wrapped in her white veil, timidly pushes through the crowd; while her Russian sisters are recognizable by
- 64345 their flashy red, green, blue, or yellow cloths and dresses. Beautiful, proud Greek women in their black robes adorned with gold. Talmudic and Karaite Jews also frequently visit the city. Camels laden with goods trot majestically through all these people in their various costumes, and riders constantly passby, or you have to give way to the clumsy carts, drawn by buffalo and equipped with oversized, creaking
- 64350 wheels.
The palace, spared by Empress Catherine II, is well-maintained; however, enclosed by high walls, through which only a single large gate can be seen, the exterior is not

very appealing. However, the interior is different. Once through that gate, you find yourself in a square shaped like a parallelogram, and you behold the mosque belonging to the palace, the largest in the entire city. Some tombstones of the ancient Tartar princes lie further on, and on the other side, one sees the main building of the palace itself, which contains several magnificent halls and before which a terrace has been created, decorated with vineyards, flowers, and fountains. There are also several kiosks, as well as the walled lawn where the khans' wives once entertained themselves.

The other cities in Crimea are: in the eastern part, Karasubazar, with 3,700 inhabitants; on the southwestern coast, north of Sevastopol, the small seaport of Koslov, or Eupatoria, with 4,000 inhabitants, mostly Tartars and Jews; south of Sevastopol, Balaklava, with an excellent harbor enclosed by high mountains; on the southeastern coast, Kaffa, near the bay of the same name; further on, Kertsch, on the Kertsch Strait, or Yenikale Strait. Near this fortified seaport, one can still see the extensive ruins of Panticapaea, the former residence of Mithridates the Great, king of Pontus and Bosphorus. Yenikale itself, situated at the entrance of the strait to the Sea of Azof, is a small fortress with 600 inhabitants. Finally, the fortress of Perekop, on the isthmus of the same name, has a population of between 3,000 and 4,000 souls. Near this place, one finds a wide, deep moat, defended by a strong wall, which has bisected the isthmus since time immemorial.

History of Crimea.

To properly assess the importance of Crimea, this peninsula, which, due to its location in the Black Sea, simultaneously dominates the coasts of Asia, the mouths of the Danube, and the entrance to the Bosphorus, it is necessary to consider the significant events that have occurred there over time.

In the middle of the seventh century B.C.E., the Milesians from Asia Minor first visited the northern coasts of the Pontus Euxine and established colonies on the present-day Kerch Peninsula, which they took complete possession of. The flourishing agriculture, which the colonists soon enjoyed, became known in Greece and prompted many Greeks to migrate to Tauria, where the ports of Theodosia, Nymphaea, Panticapaea, and Mermiciona soon arose. Encouraged by the favorable results obtained by the Milesians, the inhabitants of Heraclea in Thrace also conceived the plan to establish several colonies in Tauria. They focused on the western part and set foot on land near Cape Pharthenica. They drove the uncivilized Taurians back into the mountains and settled on the headland of Trachaea, now known as the ancient Chersonesus. Thus were laid the first foundations of the famous republic of Cherson, which flourished for more than fifteen centuries.

While the Heracleans consolidated their authority and saw their industry and trade grow, the Milesian colonies developed with astonishing rapidity. Cities were also founded on the Asian coast, where they expanded: Phanagoria, Hermonassa, and Cepas arose. All these various Milesian colonies were initially independent of one another; but at last they followed the flow of events, and, 480 years before Christ, from its political union arose the Empire of the Bosphorus.

The great wealth of the Milesians had found a principal source in agriculture, and the new government devoted its attention to this fertile branch of national existence. King Leucon exempted the Athenians from the tax that burdened the export of grain. As a result of this generous measure, exports rose to an unprecedented level, and Crimea became the storehouse of Greece. Theodosia and Panticapaea rose to become very prominent trading cities, where numerous foreign merchants came to supply themselves with woolen cloth, furs, and all the salted goods that still constitute one of the principal resources of southern Russia.

Certainly, the inhabitants of Crimea received in exchange for these products all the precious manufactured goods that luxury had brought into use in Athens, and probably all the beautiful works of art that can still be admired today in the museum at Kerch were created by Greek artists. The materials with which the Taurian colonists built their cities and palaces were also likely imported from Greece. Yet, no trace of white marble can be found in either the Crimea or the northern shores of the Black Sea; and yet, during excavations at Kerch, a multitude of pieces of this marble were found; it is even quite possible that the large sculptures used for public and private carving were sent fully finished from Greek workshops to Panticapaea.

For more than three centuries, the Bosphorus Empire enjoyed a desirable tranquility, despite the dangerous proximity of the Sarmatians, a Scythian tribe settled east of the Don. Through a bold and enlightened policy, the empire gained in prosperity and wealth, until the Roman conquest of Greece disrupted all trade relations in the East. Around this time, the Bosphorus were attacked by the Scythians, and feeling powerless

- to resist, they threw themselves into the arms of Mithridates the Great, who
64420 incorporated their state as a province into the empire of Pontus and bestowed it upon
his son Makhares.
- When Rome had defeated and lost its implacable enemy by death, it bestowed the crown
of the Bosphorus empire on Pharnaces, who had betrayed his father; but the rule of
this son of Mithridates existed only in name, and his successors, powerless as they
64425 were and devoid of all that the Milesians had previously possessed on the Asian
coast, were entirely at the whim of the Roman emperors.
(Continued below.)
- February 17, 1855 DESCRIPTION OF CRIMEA.
64430 (Taken from the work "De Oorlog," which is continually published by H. NIJGH, in
Rotterdam.)
(Continued from No. 45.)
- Around the middle of the first century AD, the Alans invaded Tauria; they devastated
most of the country and destroyed the city of Theodosia, which had attempted to
64435 resist them. They were followed by the Goths, who in turn ruled the peninsula; but
they, far from abusing their superior power, allied themselves closely with the
conquered, established numerous colonies in the northern plains, and cultivated the
fields. A new era of peace and prosperity now began for Tauric Chersonesus.
Unfortunately, however, Greece, under Roman rule, was in great decline at the time;
64440 while Egypt, Sicily, and Africa alone supplied the Roman world with grain. Despite
all efforts, Tauria could not rise above the humble position it had been placed in by
the momentous events of the first century CE.
- Amidst those first barbarian invasions, the small republic of Cherson, remote and
difficult to reach as it was, had maintained its independence. During the time of
64445 Emperor Diocletian, the Chersonites, whose territory extended across almost the
entire mountainous region, had attracted all the trade still flowing between Tauria
and some parts of the lands bordering the Black Sea. Their republics constituted the
most powerful state on the peninsula when war broke out between them and the
Sarmatians. These Sarmatians had already seized the Bosphorus kingdom and given it a
64450 king from among themselves. The struggle between these two nations lasted for almost
a century; The Sarmatians were finally driven out, and the Bosphorus, freed from the
foreign yoke, once again enjoyed the sweet fruits of peace and freedom for several
years.
- This peace, however, was short-lived and would soon be replaced by the most terrible
64455 plague yet to ravage the peninsula. The ferocious Huns, emerging from the distant
steppes of Asia, echoed their war cry on the shores of the Sea of Azof, and soon the
terrified inhabitants saw the Crimeans, crossing the sea, their wild hordes flooded
the peninsula, and the ancient empire of the Milesians was destroyed forever (375).
The numerous colonies of the united Alans and Goths suffered the same fate, and all
64460 the prosperous places that flourished through agriculture were reduced to ashes. The
Chersonites, always protected by their western location, were the only ones who
escaped destruction, thanks to the tremendous speed with which the Hunnic stream
rushed towards western Europe.
- Taurias was still groaning under the terrible disasters that the arrival of the Huns
had brought upon it, when, after the death of Attila, their returning, scattered
hordes once again brought devastation and misery. Now the Chersonites were also
threatened, and the fear of the barbarians caused them to call upon the Eastern Roman
Empire for help. Emperor Justinian, then reigning in Constantinople, immediately
64470 granted their request; but this favor cost them dearly: under the pretext that their
defense required it, the emperor had two forts erected on the southern coast, and
soon the republic became tributary to the empire.
- At the end of the 7th century (679), Tauria was invaded by the Khazars. These hordes,
who had followed the Huns and settled in Lithuania, where Attila himself had founded
64475 an independent empire for them, as rulers of a vast territory, caused Constantinople
to tremble at their approach. The Eastern emperors sought to win their friendship,
and the Byzantine court even asked the daughter of the Kalgan, or the chief, in
marriage to the son of Emperor Leo. The imperial court's fears proved well-founded,
for less than a century and a half had passed before the Khazars, who had given their
64480 name to the Crimea, established an empire whose borders extended across Europe to the
Danube and across Asia to the foot of the Caucasus.
But the Khazars, in turn, succumbed to a nomadic tribe descending from the banks of
the Volga. The victorious Peschenegs established rule over the entire region, with
the exception of the southern territory of Cherson, which was united with the Eastern

64485 Empire.
Under the rule of the Peschenegs, trade and industry began to flourish again on the peninsula; Trade with Constantinople became increasingly lively, and Byzantine traders came to the ports of Tauria to stock up on purple and fine fabrics, embroidered sheets, ermine, tiger skins, and all kinds of furs, pepper, and other
64490 spices, which the Petschenegs were buying in the eastern part of Russia and as far as the banks of the Cyrus and Araxes rivers in Armenia.

For a century and a half, Crimea, then still called Khazaria, flourished under the rule of the Petschenegs; then they were driven out, just as they had once driven out the Khazars. The development of the Mongol Empire had driven the Komani from their
64495 land; they attacked the Petschenegs and threw them back into Asia. The Komani elevated Solda, located on the southern coast of Crimea, to their capital; But scarcely had they established their authority when they had to yield to other conquerors and seek refuge in regions further west.

64500 With the expulsion of the Komani, all those fleeting incursions ceased, which for more than ten centuries had drenched the soil of Tauria with blood. After all these diverse hordes, most of whom left their names only in history, came two peoples, both equally worthy of attention: one, conqueror of Asia, had founded the most colossal empire of the Middle Ages; the other, born in a trading city of Italy, would elevate
64505 Khazaria to the center of trade between Europe and Asia.

In 1226, that memorable invasion of the Mongolian Tartars took place, ushering in that unfortunate era of slavery and oppression for the Tsarist empire, which has left such disastrous marks on the national character of the Muscovites. Russia, Poland, and Hungary were successively plowed through by the bands of the famous grandson of
64510 Tschinkis Khan, and Khazaria, which they added to their countless conquests, soon became, under the name of Little Tartary, the cradle of a powerful state that maintained its independence until the end of the 18th century. Under Mongol rule, Tauria was initially oppressed, but later it experienced a revival and soon emerged from its decline. Soldaia, returned to the Christians, soon began to flourish and
64515 proved that the sources of wool trade were far from dry, and that, now as before, only peace and tranquility were needed to develop the elements of wealth with which nature had endowed this region so richly.

had wisely endowed. In a few years, Solda rose to become the most important port on the Black Sea, becoming one of the great centers of trade between Europe and Asia. However, this city's great prosperity would not last long; another people, more
64520 zealous than the Greeks and gifted with a bolder commercial spirit, would soon give new life to the peninsula. The Genoese already owned important factories in Constantinople and had long appreciated the favorable situation of the Black Sea, calculating all the advantages that a centralization of trade relations between
64525 Europe and Russia, Persia and India, by means of that waterway, would yield. Fearing that Venice might preempt them, they managed, partly through cunning and partly through force, to seize possession of the territory where ancient Theodosia once stood. There, around 1280, they founded the famous city of Kaffa, which guaranteed the Genoese Republic dominion over the Black Sea and the trade therein. The Genoese
64530 raised Tauria to unprecedented heights: the city of Kaffa, through its size, its population, and its wealth, became a rival to Constantinople. And when their consuls also managed to gain control of Cerco, Soldaia, and Cembalo, they soon became masters of the entire southern coast of Crimea. Later, the Genoese also extended their
64535 conquests beyond the peninsula. Their galleys penetrated the Palus Maeotis (Sea of Azof), they wrested Tana, situated at the mouth of the Don, from Tartar rule, founded a fortress at the mouth of the Dniester, erected numerous warehouses in Colchida or Mingrelia and on the Caucasian coasts, and forcibly established a major trading post in the imperial city of Trebizond.

64540 Thus, the Genoese colonies became the universal storehouse for the rich products of Russia, Asia Minor, Persia, and India; they held a monopoly on trade between Europe and Asia, and for more than two centuries enjoyed astonishing wealth, dazzling grandeur, and prosperity. But finally, the radiant sun of happiness, in whose rays they had basked for so long, also waned. In 1453, the moon standard fluttered from the pinnacle of Saint Sophia Church, and relations between Crimea and the
64545 Mediterranean were severed. The Genoese foundations fell into disrepair, and the republic, despairing of their preservation, transferred them to the Bank of St. George. This transfer, concluded on November 15, 1453, severed the bond between the colonies and the mother city; discouragement and a division of forces were the
64550 result. The consular government, formerly so renowned for its honesty and virtues,

soon, through treacherous actions, enraged the Tartars, instead of seeking to ally them and unitedly resist the Porte; indeed, it offered its aid in gold to all the parties that were then tearing Crimea apart. Such a situation could not last long. On June 6, 1473, Kaffa was forced to surrender to the Turks, whether at all, and a few months later, all the points occupied by the Genoese had fallen into the hands of the Ottomans. All trade relations with Russia and Asia ceased; the Venetians had vainly purchased from the Turks the right to navigate the Black Sea for an annual tribute of 10,000 ducats. They too were expelled. Passage through the Bosphorus was denied to all the western peoples, and only the Turks and the Greek inhabitants of the Archipelago, their subjects, were allowed to visit the Black or Azov Seas. Other routes were now opened for trade: Smyrna was now elevated to a trading post, while the discovery of Vasco de Gama soon brought about a complete revolution in that trade. (Continued below.)

February 18, 1855 DESCRIPTION OF CRIMEA.

(Taken from the work "De Oorlog" (The War), which is continually published by H. NIJGH, in Rotterdam.)

(Continued from No. 48.)

Under the rule of the first Khans, liable to tribute from the Porte, Crimea lost all the importance that agriculture and trade had previously conferred upon it. Constant wars, incessant uprisings, instigated by ambitious leaders, now favored, now condemned by the Porte, and, moreover, the still deeply ingrained habits of a nomadic life—all this hindered all new development for a number of years.

Finally, however, the wealth and fertility of the soil, which could so amply provide for the needs of its inhabitants, triumphed over the volatile character of the Tartars; valleys and hills were covered with villages; the internal tranquility allowed all branches of industry to flourish again. the grain rippled again on the lush fields, the livestock improved, fishing revived, the salt pits were reclaimed.

The forests once again yielded their tribute, and soon Lesser Tartary saw a multitude of ships returning to its ports. Trade with Central Asia was indeed lost forever, but the export of native products and those brought from Russia along the Don and across the Sea of Azof—these exports were more than sufficient to spread prosperity among the population. Kaffa also began to recover and, as in the Genoese era, became the center of the country's trade; the city's prosperity even increased to such an extent that the Turks gave it the name Koutchouk-Stamboul, meaning Lesser Constantinople.

The Khans' dominion at that time extended throughout Europe and Asia, from the banks of the Danube to the foot of the Caucasian Mountains, and even the indomitable mountaineers of Circassia frequently paid tribute to the rulers of Tauria. The Mohammedan population separated into two major groups: the descendants of the first conquerors, more specifically called Tartars, and the Nogais, or Nogayers, nomadic tribes who, after the conquest of Khazaria, came under the protection of the successors of the famous Batou Khan. The former, the Tartars, who had intermingled with the remnants of the ancient populations of Tauria, constituted the civilized portion of the nation; they occupied the mountainous regions, inhabited the towns and villages, and successfully applied themselves to industry and agriculture. The

Nogais, on the other hand, lived to a certain extent independently on the vast plains of southern Russia, where they were exclusively engaged in cattle breeding. They were divided at that time into five main hordes: that of Boujiak, who inhabited the plains of Bessarabia, from the mouths of the Danube to the Dniester; that of Jedisan, the most important, who could muster 80,000 horsemen and pitched their tents between the Dniester and the Dnieper; those of Djamboïlouk and Jedickhoul, whose descendants can still be found in the territory their ancestors occupied from the banks of the Dnieper to the western shores of the Sea of Azov; finally, the tribes of Kouban, who roamed the steppes between the Dnieper and the Don, today the domain of the Black Sea Cossacks. All these different tribes could, if necessary, mobilize more than 400,000 troops. Such was the political situation of Lesser Tartary when the Russians sought to subdue the coastal regions of the Azov and Black Seas. We must now examine how

Crimea became connected to the Russian Empire. Russia's first attempts to gain possession of Crimea date back to the mid-17th century; but it wasn't until 1689 that Crimea was attacked with armed force. Peter the Great suddenly appeared with a powerful army near Perekop, then called Orkapi, and penetrated the peninsula. It seemed as if he could take possession without a fight; but Khan Selim rallied his loyalists, met the enemy, and drove them back.

This defeat, which cost the Tsar a large part of his best troops, seemed to have instilled in him some respect for the Tartars, whom he had previously counted very little; it was, however, several years before he returned to harass them. In 1696, he

undertook a new campaign, and this time, though not without great effort, he succeeded in capturing the important cities of Azov and Taganrog. Now the idea also dawned on Peter the Great to gain control of the Black Sea, whatever the cost. He issued a ukaze, urging his people to offer monetary sacrifices to enable him to launch the holy and glorious attack he intended. Nobles, merchants, and priests all strove to bolster the treasury, and Peter felt able to assemble a formidable army. However, he would not command that army in person. From his carpenter's cottage in Zaandam, he sent the order for the attack, and the army, obedient to the imperial word, even though it was given from afar by Peterbaas, advanced toward the Crimea and soon captured the fortress of Perekop.

When Peter returned to his empire, he began building fleets, increasing his armies, and strengthening his border fortresses. Turkey, always keeping a watchful eye on Russia, demanded an explanation for these warlike preparations; but the Tsar replied that he was master of his own country and that he could do whatever he pleased without asking the Sultan's permission. This answer was not very suitable to satisfy and reassure Turkey; moreover, the loss of Azof had not yet been forgotten, and they were eager to regain that city. The Porte declared war on them.

A neighbor, and Khan Dewlet invaded Russian territory.

Tsar Peter immediately planned measures for a major and, he hoped, final campaign against Turkey. Admiral Apraxin was sent to Azof, and Peter himself hastily marched to the Pruth River in support of one of his army commanders, who was threatened by a hundred thousand Turks under the Grand Vizier, Baltigie. It was on this occasion that Empress Catherine, the former soldier's wife, saved the Russian army from utter destruction. When Tsar Peter arrived at Jassy, he received bad news: the hospodar of Wallachia, on whose help he had counted, had secretly gone over to the Turkish side; a long-awaited shipment of provisions failed to arrive; the troops had been struck by disease; swarms of insects ravaged the fields, and the burning sun dried up the streams and brooks. Peter understood that he had to try as quickly as possible to place the Pruth between him and the enemy. He crossed the river and wanted to prevent the Turks from following him, but it was too late; the enemy was already on the other side. The two armies were now close together; but the Russians were in a miserable condition; hunger and thirst ravaged them terribly, and within sight of a river, hundreds of them died of thirst, for the Turks held the opposite bank and prevented the Russians from approaching the water with their artillery. Peter attempted to withdraw unnoticed under cover of night; but the Turks had occupied all the passages, and on July 20, 1711, a battle broke out in which the Muslims emerged victorious. During the night following the battle, Empress Catherine discovered a plan she had devised to prevent further bloodshed, and the next day it was put into action. She sent all her jewels and furs as a gift to the Grand Vizier, who commanded the Turkish army, along with a sum of money to be distributed among the members of the council. In the letter accompanying these gifts, Peter wrote to the Grand Vizier, "that if he had been so unfortunate as to displease His Highness, he was ready to remove the grounds for complaint; but that he adjured him to prevent further bloodshed and to silence his guns." A few hours after sending that letter, Baltigi actually ordered a cessation of hostilities, but he demanded as a first condition for peace the immediate withdrawal of the Russian armies, the abandonment of Azov and the surrounding territory, and the demolition of several fortresses. The peace treaty, known as the Treaty of the Pruth, was concluded on these grounds.

Twenty years later, the Russians violated the peace they themselves had desired and destroyed Azov. They then advanced into Crimea, devastated most of the peninsula, and occupied it for three months. It now became clear that Russia had set its sights on conquering Crimea, and the following year the Turks preempted the Russians, having assembled a sufficient force to repulse them in the event of a renewed attack.

Catherine II, who ascended the Russian throne in 1762 after the death of her husband Peter III, zealously followed Peter the Great's policy toward Crimea. When the Porte forced her to declare war in 1770, she sent Count Romanzow at the head of a powerful army to Crimea. The city of Bender was besieged in vain by this general, and Khan Kaplan advanced against the enemy at the head of 80,000 Tartars. A month of mixed success had already elapsed on the banks of the Pruth when the Russian general made a retreat; the Tartars abandoned their camp and attacked the retreating enemy, but the latter soon formed a front and, despite a Turkish army coming to the Tartars' aid, Romanzow achieved a complete victory. The cities of Ismailov, Bender, and Ackerman subsequently fell into the hands of the Russians. But Crimea was still not conquered.

To finally achieve this long-desired goal, the Empress sent secret agents to the peninsula in 1772 to incite the population to revolt; moreover, Prince Dolgoroucki appeared with an army before Perekop. The sword completed what the ruse had begun:

the Tartars, who attempted to defend their borders, were defeated, and Dolgoroucki triumphantly entered Crimea, receiving from the Empress the honorific of Krimsky. Shortly thereafter, an armistice was concluded between Turkey and Busland, and the terms of peace were discussed at Fokshiani. However, the Empress's demands proved too high, the negotiations remained fruitless, and hostilities resumed. Katharina, however, had managed to take advantage of the lull; she had secretly won over the Khan of Crimea and persuaded him to declare independence from the Porte and place himself under the protection of Russia. The war between Russia and Turkey was only ended by the well-known Treaty of Kainardji, concluded on July 25, 1774, in which the Sultan recognized the independence of Crimea. (Continued below.)

February 19, 1855 DESCRIPTION OF CRIMEA.
(Taken from the work "De Oorlog," which is continually published by H. NIJGH, in Rotterdam.)
{Continued from No. 49.)

But Dewlet III, who was called to the position of Khan, was pro-Turkish; Katharina sought to gain support through money and valuables, and when the population began to revolt, a Russian army invaded the peninsula: the Khan was deposed, and a favorite of the empress, Sahim Gherai or Guerei, was appointed in his place. Porte Dewlet III attempted in vain to restore his rights. Dahim Gherai remained master of the Crimea. He sent an embassy to Petersburg to request the empress to take the Crimea under her high protection; Katharina readily complied with this request and, together with the Khan, began providing a guard of Russian soldiers. It is said that this bodyguard was deliberately sent to the Crimea to be murdered there, so that the empress, under the pretext of avenging their deaths, could have the peninsula reoccupied. Be that as it may, it happened thus: the bodyguard was attacked and defeated by the Tartars, and Katharina sent a new expedition to the Crimea, commanded by Prince Prozorowsky, at whose approach Sahim's enemies fled.

In 1779, after a new war with Turkey, Russia allied itself to evacuate the Crimea again; but the Khan was and remained merely a tool in the hands of the Empress, and while she, at his request, sent him an appointment to the Russian army and decorated him with the Grand Cross of the Order of St. Anne, she, on the other hand, used these favors, through her agents and her gold, to incite the population against the poor Khan, who so completely forgot his dignity and trampled on nationality.

Soon Sahim was forced to flee to Taganrog; now a Russian army under Potemkin advanced to support him. He was brought back to his capital and once again recognized as Khan by the chiefs. The Empress had not suspected this, but she was undeterred; she instructed her envoy in Constantinople to ensure that the Sultan remained neutral in any unrest that might arise in the Crimea. Deeply indignant at Russia's insinuations, the Porte sent a Pasha to the island of Taman to take possession of it in the Sultan's name. Whereupon Sahim, urged by the Empress, in turn sent an envoy to that Pasha with orders to withdraw. However, instead of complying with this impudent summons, the Pasha had the Crimean envoy publicly executed. The Empress had now found a new pretext to seize the Crimea, without sparing the Porte. She forced the Imans and other Tartar chiefs to swear an oath of allegiance to her on pain of death and issued a manifesto to justify her deceitful behavior. It included the following:

"Since our last war against the Ottoman Empire was entirely successful, we undoubtedly had the right to incorporate Crimea into our empire. Nevertheless, in our ardent desire to ensure public peace and to establish good relations between our court and that of Turkey, we did not hesitate to abandon this and other conquests. This was the reason that moved us to demand the freedom and independence of the Tartars, who had already been conquered by our weapons, in the hope of thus permanently removing all cause of discord or reflux between Russia and Turkey..."

Thus ran the opening of the manifesto, while the conclusion was worded as follows: "Inspired by the sincere desire to confirm and maintain the peace concluded by treaty with the Porte, we believe we are justified in putting an end to the unrest in Crimea. To this end, we must annex the aforementioned Crimean peninsula, the island of Taman, and Kuban to our empire; this is no more than a fair compensation for the disadvantages we have suffered and for the difficulties encountered in our attempts to maintain peace and tranquility." On June 27, 1783, Potemkin advanced with an army of 70,000 men to the borders of Crimea; General Repnin followed him with 40,000 men, while a third army under Romanzov gathered at Kyiv. At the same time, the fleet in the Black Sea was prepared for battle. But Turkey was too weak to wage war; the first of a variety of negotiations were held. The following year, a new treaty was

concluded, whereby Turkey recognized the empress as sovereign over Crimea, the island of Taman, and part of Kuhan. Thus, Katharina finally saw her demand fulfilled, while she secured an extensive territory, one and a half million subjects, and control of the Black Sea.

But she also had to try to preserve what she had acquired, and fearing that many among the freedom-loving Tartars would not willingly submit to her yoke for long, she had several thousand of them deported to Siberia. Three years later, Katharina made her solemn entry into Crimea, and her visit to the peninsula was a succession of splendid festivities that formed a strange contrast with the miserable state of the conquered province. Thus the Tartar Empire had fallen entirely under the control of Russia, after fifty years of that colossus's sometimes secret, sometimes open, and armed attacks had shaken and disturbed it, gradually exhausting it and finally dissolving it entirely.

Soon, the last vestiges of the flourishing Tauria, so often devastated, yet always rising again from its ruins, disappeared. As early as 1778, Russia had facilitated the emigration of all the Armenian and Greek inhabitants of the peninsula, and an industrious population had voluntarily, as Russia claimed, left fertile regions to settle in the wild steppes of the Don and the Sea of Azof. At the same time, also under the influence of imperial authority, the emigration of the Tartars and Nogais began; Some of them sought refuge in Turkish territory, while others united with the Caucasian mountaineers. When the Russians finally took full possession of the peninsula, even more Muslims left their native land. The entire Jedisan tribe had already disappeared by the time the Czars' authority extended to the Dniester; the Tartars, who inhabited the regions between the Dnieper and the Sea of Azov, migrated less widely, for even before the conquest of the Crimea, they had been surrounded by imperial armies. The peninsula itself, where the population had settled more permanently and firmly and which formed the center of Tartar civilization and power, also suffered the most. It was devastated and drenched in blood; it lost more than nine-tenths of its population; the cities were plundered and destroyed; the fields remained uncultivated and desolate; misery and poverty replaced prosperity and prosperity. Sixty years have passed since then, during which the Russian authorities encountered the slightest resistance and had no revolt to suppress. Yet, even despite the restoration of free passage through the Bosphorus, Tauria could not rise from the deep abyss into which it had fallen as a result of the events at the end of the 18th century. Magnificent country houses arose on the southern hills, and luxury and abundance reigned there; but the vital forces of the people were suppressed and undermined, and native industry and agriculture were destroyed. It is precisely this undisturbed tranquility in which the diminished Tartar population has sunk, without deriving any benefit from it, that proves that all sources of prosperity have dried up, that all moral energy has been extinguished, and that the death-dealing system of Russian administration has suffocated. When Russia had definitively established its authority in the Crimea and calm had followed the ravages of the Muscovite armies, it seemed as if the imperial government wanted to rekindle the peninsula's last sparks of prosperity. Emperor Alexander, in particular, was imbued with good intentions for the Crimea, whose resources he knew. But the poor state of administration remained, and half-measures were resorted to: customs and quarantines were regulated; Kaffa was renamed a Milesian colony; several German villages were founded, now numbering nine, with a population of 1,800; considerable portions of land were ceded to Russians and foreigners; vineyards were planted, and even attempts were made to cultivate olives, but the vital questions remained unresolved. There was no concern for exploring means of entertainment or establishing trade relations, and the government, true to its prohibition system, excluded all freedom of trade, thus depriving Crimea of its only means of revitalization.

Kaffa, which at first seemed destined to become one of the principal ports of southern Russia and suited itself particularly well to this end, was soon ousted by Kerch. The old Theodosia had to give way to the old Panticapaea, the Milesian colony had to make way for the old capital of the Bosphoric empire, and this despite the fact that the port of Kerch, sometimes inaccessible for three to four months, was far less safe and good than the excellent, always open and free port of Kaffa, and although the latter city is infinitely better situated near fertile areas than Kerch, which lies at the edge of a sparsely populated and barren peninsula.

Nevertheless, Kerch was elevated to a first-class port in 1827 and equipped with customs for export and import and a hospital for quarantine, which is very strict and lasts more than thirty days. The city soon began to develop, but this development was only artificial, and the quarantine and customs measures, which are very costly and hinder ships sailing to and from the Sea of Azof, naturally cause trade to languish.

64815 The port city of Kerch has thus, as was to be expected, failed to realize the brilliant expectations that were foolishly harbored for it; it has hampered the redevelopment of the once-famous Genoese colony, robbed Crimea of its commercial importance, and harmed the ports in the Sea of Azov by impeding navigation, all without deriving any lasting benefit from it itself.

64820 June 25, 1855 Kerch and Yenikale
The second edition of a work entitled:
"The Crimea with Sevastopol, Balaklava, and other cities, together with a description of its rivers, lakes, mountains, and valleys, as well as its history, inhabitants, laws, customs, and way of life, by Th. A. Fedorov. With three city views and maps."

64825 This monograph contains a description of Kertsch and Yenikale, cities so easily captured by the allies these days. The following lines, taken from the aforementioned work, provide a glimpse into the significance of this conquest, not only from a political or commercial perspective, but also from a scientific one, assuming that appropriate use is made of the antiquities located there, some of which are very valuable, and that preliminary reports of the wanton robbery of the Kertsch museum do not materialize. Kertsch, the ancient Pantikapea, the seat of the Bosporian ruler, lies 2,057 versts from Petersburg, 1,413 from Moscow, and 201 from Simferopol, on a deep bend or bay that closes off the Cimmerian Bosphorus. It covers a fairly large plain, extending along the bay's northern shore, on its level, surrounded by hills.

64830 Pantikapea, like all cities situated on both banks of the Cimmerian Bosphorus, was founded by the Milesians in the first half of the sixth century BC. The government of this city, as in all trading colonies, was probably initially democratic, but history is silent about the first and possibly most successful years of its political existence, and Pantikapea first appears as the capital of the Bosporian ruler. Present-day Kertsch is the capital of the district that makes up the separate Kertsch-Yenikah city-government, and was formerly called "Krtschew" by the Russians, and "Tscherkio" by the Italians and Genoese, based on its sound. In the last twenty years, Kertsch has acquired the present appearance of a European city through various additions.

64845 Kertsch is the Turkish name for a fortress known in fourteenth-century geographies as Bosphorus, Waspro, and Pandiko. It was most likely built by the Genoese on the harbor side of ancient Pantikapea, at the foot of the hills where the ruins of that city were located.

64850 When Kertsch came under Russian rule in 1771, five to six hundred low huts surrounded the fortress, which was built of sandstone and had a rounded shape with projecting corners. Most of these huts were demolished, and a fort in the shape of a star was built to defend the harbor. However, this fortification was very insignificant, as it was dominated by Mount Mithridates, causing Kertsch to fall into poverty and oblivion. In 1821, the location of this town, with its trade implications, attracted the attention of Emperor Alexander, who declared Kertsch a seaport. The fort no longer exists, and a public market has taken its place. A tower on the beach, the only remaining medieval monument, is a tower, which is therefore preserved today. Grain shipments from the Don and the northern coasts of the Azov Sea used to pass through Taganrog; but the sandbanks of this sea, the strong winds and the precautions which had to be observed along this entire coast, delayed this voyage considerably, so that a ship from the South of Europe could only sail once a year. It could take on cargo in the Azov Sea. The establishment of a deliberate facility at Kerch made observing the quarantine much easier than was previously the case throughout the Azov Sea, and the construction of extensive warehouses made sailing to Taganrog all the less necessary, as an excellent roadstead was also found at Kerch. The quarantine buildings were built four wersts from the city on a stony promontory jutting out into the sea, where the Greek city of Marmikion once stood. Due to the muddy waters, ships cannot approach the Kerch quay, but they remain in the vicinity of the quarantine, where the sea is very deep and provides excellent anchorage.

64860 The Kerch quarantine facility, thanks to everything that prudence and care for the prevention of the spread of disease can dictate, is one of the most excellent of its kind in Europe. It alone encompasses everything good and useful found in the quarantines of Marseille, Genoa, Livorno, and Trieste. Moreover, it was built according to a new plan, which can be expanded as traffic increases. All ships arriving from the Levant and bringing Russian goods, brought in by coastal vessels from Taganrog, remain in the Kerch quarantine facility. Over time, Kerch could become one of the most important depots for trade between Europe and Asia.

64875 One advantage of the Kerch port can also be considered the possibility not only of offering the inhabitants of the Black Sea a place to sell their goods, but also of

64880

establishing relations with even the rough Caucasian tribes, which could be fostered by the staff of Mercury.

In Kerch, a church is particularly noteworthy, bearing the name of John the Baptist, which has existed for twelve centuries. The dome of this magnificent building is supported by four gigantic columns of gray marble, whose bases have sunk deeper into the earth than a sash. A multitude of inscriptions, bas-reliefs, column ruins, etc., found in this church lead to the conclusion that it was built by the first Christians who settled in these regions, specifically from the ruins of the temple of the famous Aesculapius of Pantikapea, of whom ancient writers often mention. Tradition also holds that this church was built on the site where another had been erected by one of the apostles who had come to the shores of the Black Sea to preach the Holy Gospel. Here is an inscription on parchment, which, according to the opinion of several archaeologists, must date at least from the sixth century. Many broken Greek bas-reliefs and columns lie scattered in the various corners of the cemetery, including a female statue, the work of a powerful chisel, while the torso of a male statue, also found there, is of much less value. It is a pity that the head of one of these statues rarely survives. During their first invasion of the Crimea, the Tartars, out of barbarity and superstition, destroyed the temples, crushed the monuments of the fine arts, and used the precious remains of Greek and Roman art to build fortifications and mosques. Within the city, and almost in its center, rises a fairly large mountain, descending perpendicularly into the sea, called the Mount of Mithridates. On its summit stands a grave mound covered with enormous stones, called the Tomb of Mithridates. The mountain has been searched in many places, and a wealth of human bones and coins of great antiquity have been found. Today, a museum stands on the summit of the mountain, where all the objects found in this tomb and its surroundings are preserved. The facade of this museum recalls the ancient Temple of Theseus in Athens. From the museum, one enters the city via a magnificent staircase that leads to the arcaded market square.

Among the buildings of Kertsch, we must also mention the imperial steam engine factory, which manufactured the steamboats of New Russia and the Caucasus and was founded in 1846.

Kertsch has 13,106 inhabitants, most of whom are Greek. It is regrettable that these Greeks, like their predecessors, the Tartars, have not been able to extract from their new, so richly endowed homeland the advantages it is capable of offering them. The charming valleys and hills of Pantikapea remain uncultivated to this day and are used exclusively for food for numerous herds of cattle and sheep, while the skilled hand of the farmer could produce from them all the grains and fruits known on earth. In this regard, it is sufficient to mention here that the caper bush, so delicate and so sensitive to cold that it thrives on its own in the vicinity of Kertsch on the seacoast without any human care, and that the wine produced there is among the best of the Crimean peninsula.

The Greeks of Kertsch are largely engaged in fishing, especially herring and sturgeon, from which this place derives great profit. The sturgeon is salted here in the Dutch manner and transported to the interior of Russia. The necessary salt is provided by the Aputski and Cherufski lakes near Kertsch, from which nearly half a million pounds of salt is obtained annually. In the vicinity of Kertsch there are also sulfur and naphtha springs, from which the inhabitants are equally unable to make any profit. Moreover, one finds here the remains of an ancient waterfall and considerable shell-lime quarries. Twelve versts from Kerch lies the Bay of Kamusch-Burunn, known for its lucrative herring fishery, which takes place there annually.

Trade from Kerch is not very substantial, as ships only come here to observe their quarantine. After the quarantine in Kerch has expired, the majority of foreign merchandise is brought to Taganrog on ships from foreign ports, as well as on coastal vessels, to pay the toll. Only a small portion of foreign goods is declared at the Kerch customs office, such as tree oil, raw sugar, coffee, dried and fresh fruits, Greek wines, tobacco, Turkish cottons and silks. These products are largely consumed in Kerch and in the neighboring towns of the Crimean peninsula. The principal item exported from Kerch is Crimean salt, of which one to two million puds are loaded annually in the ports of the Azov and Black Seas. Close to the city, besides the sulfur springs, one also finds slate quarries, mountain oil, yellow ochre ore, and many mounds of that exceptionally fine clay, which the ancient inhabitants of these coasts undoubtedly used to make those precious vases, new ones of which are constantly found in the ruins of their old capital. This clay was destined to become a new, significant branch of trade and industry, as it can be used to make exquisite porcelain.

Straight streets are not found in the city; they are mostly crooked, and the city consists of a few houses scattered along the slopes of Mount Mithridates. However, these are mostly built of stone, for which the surrounding area provides the finest building materials. The houses built more recently have a European appearance, while the older buildings, such as the Bazaar, bear the stamp of Asiatic influence and still vividly recall the former Tartar rule. Tartar, Greek, and Russian are spoken everywhere here. Englishmen also frequently visit Kerts. For example, it is said that two English travelers, one from Petersburg and the other from Calcutta, had designated Kertsch as their rendezvous, and were so meticulous that one arrived only four days earlier than the other.

In the vicinity of Kertsch, approximately [a thousand] burial places can be seen; in one of them, precious gold ornaments such as crowns, scepters, shields, etc., were found. In another, a tomb with crossbows was discovered, consisting of enormous square blocks of stone, unconnected by any trass. No more magnificent tomb than this has been found in the tombs of any Roman emperor, but it was completely empty; the objects within were robbed, and thus it is unknown which of the great men of this world were buried there. In other burial mounds, numerous Greek vases, statuettes, and urns of various sizes, often masterfully crafted, were found. Besides the skeleton of a woman, even the remains of her beloved bird were found; nets and a beautifully crafted basket woven from small wooden rods were also discovered, along with statues and gravestones with inscriptions dating back to before the birth of Christ.

Among the multitude of these burial mounds of Kertsch, the most remarkable are: first, the golden or princely one, called Alty Oba by the Tartars, and second, the Kurgan Kulodach.

The golden or princely Kurgan, located three versts from Kertsch on the road to Feodosia, deserves attention, indeed even a particularly careful study, by archaeologists, as it is an excellent monument that illustrates two architectural periods: the Cyclopean and the Bosporan. The golden Kurgan has for countless years been considered the repository of immense treasures, and popular superstition has surrounded it with fearsome apparitions and monsters; but now it is acknowledged as true that this Kurgan served as the burial place of the princes of the Bosphorus.

Evidence of this is provided by the princely crowns found there, shaped like laurel branches with long leaves of beaten gold, bracelets, and other ornaments, which offer admiration for the fine and masterly workmanship of that remote antiquity. A number of these precious objects, signs of the wealth and prestige of the Pontic dynasty, have already been transported to the capital of the Russian monarchy and are preserved in the Imperial Hermitage.

The Kurgan Kulodach lies six versts from Kertsch, also on the Strait of Feodosia. In this burial mound, a cell measuring two squares in length, two squares in width, and three squares in height was discovered; its groin vault consisted of very large square stones. Two skeletons, one male and one female, were found here. The female's head wore a gold diadem with enamel stars, and a braided gold chain hung around her neck. On the chest lay two gold medallions, and the arms were adorned with bracelets. On either side of the female robe were gold vases with Scythian images, and next to the head lay a silver scepter and a sacrificial knife with a gold handle. Similar objects were also found on the male skeleton; in addition, a gold shield (depicting a fish, a snake, a Medusa's head, and Scythians), gold statuettes depicting Scythians, and other objects. To the left of the entrance stood three very large cauldrons of red copper, filled with ash and burnt bones. More than 40 pounds of gold alone were found in this cemetery.

The first impetus for investigating the ancient monuments in the Kerchian graves came from Chancellor Count N. P. Rumjanzow. Following his decree, a Kertsch resident, Lord du Bruiks, examined the Kurgans located there for several years and reportedly brought the count many curious discoveries. Captain Patanioti discovered a second burial vault in the aforementioned golden or princely Kurgan, containing numerous valuables encircling a skeleton whose bones were of unusual size.

Behind the village of Glinische, a marble sarcophagus was found in a burial vault, containing a multitude of gold, silver, and bronze objects of unusual artistry. This is said to be the burial place of the wife of the Bosporian prince, Riskoporis IV, a contemporary of Caracalla; thus, it would date from the beginning of the third century. The most remarkable object found in this grave was a gold mask of the queen's face; a gold diadem, bracelets, and a censer studded with Syrian garnets. a ring with a stone on which Amor was depicted in relief resting on his bow; a large

65015 bronze offering bowl, in some places of which the gilding was still visible; a small, square, striped column on which stood a satyr wreathed in vine leaves; a round, flat silver platter with the Greek inscription "To Prince Riskoporis," several silver vessels of various kinds, silver ingots, etc.; a multitude of small gold ornaments, flowers, and stars, some belonging to the clothing and some to the domestic luxury of the ancients, which testify to their taste, their love of splendor, and the high degree of their artistic skill.

65020 A number of burial mounds are located on the road leading from Kertsch to the quarantine facility, on the site where the ancient city of Marmikion once stood. Major excavations are undertaken here every year; for example, in 1843 alone, seventeen Kurgans were opened, in which thirty-three burial sites were discovered. The excavations are now carried out at the expense of the government, which has hired

65025 special workers for this purpose. The objects found here are kept in the museum in Kertsch, and some are also sent to St. Petersburg. At the exhibition of antiquities in the museum A chronological order is observed as much as possible. Antiquity researchers and antiquity enthusiasts will find almost nowhere as fertile a territory as in the vicinity of Kerts.

65030 Yeni-Kale is 212 versts from Simferopol and 12 versts from Kerts. This city has belonged alternately to the Genoese and then to the Turks, and is now almost exclusively inhabited by Greeks. In the northern part of the city stands a small fortress, built by the Turks and improved by the Russians. Noteworthy are an Eastern-style gate and an enormous square tower, whose architecture recalls the Genoese

65035 warfare. The majority of the city's inhabitants make their living from fishing and conduct a brisk fish trade, primarily in Kerts. Close to Yeni-Kale stands a beacon, which guides ships in the Azov Sea.

65040

AGATHANGELOS

65045

(Greek for "messenger of good news"), the supposed author of a History of the Armenians, which describes the conversion of King Trdat of Armenia to Christianity at the beginning of the 4th century. The Armenian version (Aa) of this History dates from the second half of the 5th century. The first mention of a history by Agathangelos in other Armenian sources is found in Lazar of P'arp (ca. 500). A Greek version of Aa (Ag) was made soon after the Armenian received its present form. On Ag depend an Arabic version and numerous secondary versions in Greek, Latin, and Ethiopic.

65050

In addition to the "A" recension of versions, which all derive from the known Armenian text, there is a less homogenous "V" cycle derived from a lost Armenian text which has left no direct trace in the later Armenian tradition. To the "V" cycle belong two Greek, two Arabic, and a Karshuni version.

65055

In the prologue to Aa, Agathangelos introduces himself as an eyewitness of the events he describes and claims to be writing at the express request of King Trdat. But the History received its present form well after the invention of the Armenian script (ca. 400). It is a compilation of various traditions welded into a none too coherent whole.

65060

The main divisions are the following:

- war between Armenia and Persia after Ardašīr I's revolution;
- the restoration of Trdat to the Armenian throne with Roman help and the imprisonment of Gregory;
- the martyrdom at Valarshapat of nuns supposedly fleeing from Diocletian;
- the release of Gregory and the conversion of king and court; the destruction of pagan temples and the establishment in Armenia of a regular Christian clergy and hierarchy.

65065

65070

After the prologue, one manuscript of the Ag version (Florence, Laurentianus, Plut. VII cod. gr. 25; 12th cent.) inserts the story of Ardašīr's revolt against the Arsacid Artabanus V. It is derived from a lost Armenian version of the Pahlavi romance, Kārnāmag ī Ardaxšīr ī Pāpakān, and does not go back to the time of the translation of Ag. There is no suggestion in Armenian tradition that this episode was ever associated with the Armenian Agathangelos. The Armenian History proper begins with an account of the wars between Khosrov, king of Armenia, and the Persians after the fall of the Parthian Arsacid dynasty. Khosrov attempted to avenge the Parthians; for the Armenian Arsacids had second rank in the Parthian kingdom (Aa 18). He organized a coalition of peoples from the Caucasus and the "Huns;" but after ten years of war he was murdered by a renegade Parthian noble, Anak, at Ardašīr's instigation. Armenia was then made into a Persian province, Khosrov's son Trdat having fled to the Roman empire. Trdat was later restored to Armenia by an unnamed emperor (Diocletian in later Armenian tradition). Agathangelos has thus condensed the political events of some sixty or more years into the life of Trdat from childhood to adulthood. When Trdat was restored he was accompanied to Armenia by Gregory, the unrecognized son of the regicide Anak; he had been brought up as a Christian in Caesarea.

65075

65080

65085

Having refused to sacrifice to Anahit (Mid. Pers. Anāhīd), he was tortured and imprisoned for thirteen (or fifteen) years. Meanwhile a group of nuns from Rome supposedly take refuge from Diocletian in Armenia, but are martyred at Trdat's capital, Valarshapat. In retribution Trdat is turned into the form of a boar, but is cured when Gregory is brought alive out of prison. The rest of the History describes:

65090

- the conversion of the Armenian court;
 - the burial of the martyrs at sites revealed to Gregory in a vision; the destruction of pagan temples;
 - Gregory's consecration as bishop for Armenia in Caesarea (an historical event, probably occurring in 314);
 - the building of churches and missionary work throughout Armenia;
 - the visit of Trdat and Gregory to the newly converted Constantine;
- and the attendance of Gregory's son and successor Aristakes at the council of Nicaea in 325.

65095

65100

The History of Agathangelos is not of great value as a historical document. Authentic reminiscences of the bishop Gregory, whose episcopal see was at Ashtishat in western Armenia, have been overlaid with elaborate inventions based on biblical and hagiographical motifs. The missionary work of Gregory in Armenia has been based almost verbatim on the life of Mashtots' (inventor of the Armenian alphabet) written

65105

by the latter's pupil Koriun soon after 440. The association of Gregory with the cathedral at Valarshapat dates from after the division of Armenia in 387 into Roman and Iranian spheres of influence, when the patriarchs moved to eastern Armenia. Trdat and Gregory's visit to Constantine is legendary, but the signature of Aristakes does appear on the lists of bishops at Nicaea (see H. Gelzer, *Patrum Nicaenorum Nomina*, Leipzig, 1898).

The pagan deities and their cult sites mentioned by Agathangelos have attracted attention, but little reliable information can be gleaned from this hagiographical work. Indeed, the description of Anahit's cult at Erez (Aa 48-49) bears no relation to the account in Strabo (11.14.16) but is based on a combination of passages from the Books of Maccabees unrelated to Anahit. She is described by Agathangelos as the special protectress of the Armenian people, source of life and fertility, and as the "golden mother" or "golden-born goddess" from the wealth of her sanctuaries. At Ashtishat Gregory's first church was built on the site of a "trinity" of cults: Anahit, Aramazd (Mid. Pers. Ohrmazd, father of all the gods, creator of heaven and earth), and Vahagn (Mid. Pers. Wahrām), called vishapak'at ("who handles dragons"). Other deities mentioned by Agathangelos are Ashtlik ("little star," spouse of Vahagn), Tir (called "interpreter of dreams"), Name (Nanaia), Barshamin, and Mihr. Agathangelos is also credited with a list of early Armenian kings supposedly culled from Trdat's archives and included in the so-called "Primary History". This is an account of the early mythical Armenian heroes, the settlement of Armenia, and the establishment of the Armenian Arsacid dynasty. It is of unknown authorship and date, and was later incorporated as the first chapter into the seventh century History of Heraclius attributed to Sebeos.

History of St. Gregory and the Conversion of Armenia

Introduction

Though we cannot date Agathangelos' History precisely, we know that it was written earlier than the tenth century, and most likely did not receive its final form before the year 450. There are several versions of the History, and there is also at least one other Armenian account of Saint Gregory's life which differs considerably from Agathangelos' in the facts and details its presents.

The name "Agathangelos" is probably fictional, even though the writer introduces himself in the Prologue as a man from the great city of Rome who is well versed in literary skills and knows several languages. The Prologue also tells us that Agathangelos was an eyewitness to the events he describes. It is unlikely that this is true, especially because some of the words he uses are taken directly from the life of Mesrob Mashdotz written by that great monk's student, Koriun (about which you can read in the first volume of this series).

What, then, is this History? It is a piece of hagiography (a biography of a saint, written usually with affection and admiration rather than impartial judgment) which contains many of the traditional characteristics of that genre. It is customary for a hagiographer to say he witnessed the events he writes about, for example. It is also typical for the writer to describe the saints' tortures at the hands of pagans in great detail, as Agathangelos does here. The long public prayers which Gregory recites as he is being tortured, and his seeming imperviousness to the pain being inflicted on him, are typical of the descriptions in many lives of saints. Another thing that often appears, as it does here, is a "text" of an anti-Christian edict that a pagan king makes when the Christians threaten his price and power.

If so much of the History, including its writer's name, is fictitious, how can we accept it as a piece of history? What does it offer to the modern reader? In fact it offers a very great deal. Agathangelos does give us a history of Gregory's life and times; the people and events he writes about really existed and had a great impact on the life of the Christian Church and the Armenian people.

But we cannot look at this History as merely an impartial recording of events, for it was not written to be that. Agathangelos has produced an account which is meant to describe Christian faith and its powerful effects, and to inspire those who read it to greater faith. We can see this in many of the History's characteristics. First, the biblical references and similes are innumerable. The prologue uses the nautical imagery so popular in Agathangelos' time, and ties it directly to the Bible's story

of the search for the pearl of great price. The long prayers of Gregory and of Hripsime are filled with Biblical phrases and references of those who preceded them in suffering and enduring for the Lord.

Even when Agathangelos describes well-known events, he borrows from the Bible. Diocletian's persecution of the Church is talked about completely in Bible images, with no reference to any actual events. Gregory is nourished in the terrible pit as Elijah was; Drtad's bestial transformation recalls that of Nebuchadnezzar. There are also countless references to liturgical and patristic writings, and it is unfortunate that we modern readers miss so many of these. Agathangelos presumed on the part of his readers an intimate familiarity with the Scriptures, Liturgy, and spiritual writings that most of us today simply do not possess.

Agathangelos had a purpose in mind as he wrote about Gregory. That purpose is reflected in some of the differences in emphasis between Agathangelos' work about the saint and the work of others. For example, Movses Khorenatsi gives us much more detail about Gregory's origins, and tries to tie him to the first enlightener, Thaddeus. In general, he gives more detail about all aspects of Gregory's life than Agathangelos does. But Agathangelos is not interested in establishing an apostolic tie for Gregory, or presenting his life in detail. His purpose is mainly to enhance Gregory's role as the first bishop, first church builder, and first establisher of a hierarchy in the Armenian Church. He wants to show the importance of the hierarchical structure of the Church, and emphasize the authority of the patriarch's position, and this he does by tying both to the great saint so highly venerated in the Church. Central to this effort is Agathangelos' description of Gregory's vision of the burial place of the martyrs. Gregory is shown a golden base where the cathedral at Vagharshapat (later Etchmiadzin) is to be built. Thus Agathangelos establishes a divine foundation for the cathedral and for the church leaders who will reside there so again, he makes a case for the "rightness" of the hierarchs and the hierarchical structure of the Church.

The History is, as we have said, hagiographical. To some people this means that its value is diminished because of it is invented, some facts are embroidered, and the writer is consciously trying to make his subject "look good". In many modern dictionaries of saints' lives, you will see events dismissed impatiently as "merely legendary" or "invented by a pious biographer". But we must remember that historical writing is always interpretive. Nobody can write about things that happened and not assign some meaning to them. And the truth is that the Christian saints and martyrs did stand up against the most powerful rulers the earth had ever known, so powerful that they were traditionally considered to be divine. The truth is that saints changed the world in ways that nobody else has ever done, and that they are known throughout the world despite the absence of "advanced" communications equipment in their time. They were persecuted by hard-headed kings; they did change history; they did bring whole nations to Christ.

Agathangelos wrote as those of his day wrote. It is not the way we write today, and perhaps we can grumble that he did not "stick to the facts". But if we believe that the greatest fact is Christ and His salvation, then the History is a factual work. It does give us the truth, for all the people in it lived through the things it describes. But it gives us that truth in light of the coming of Christ. In all the world, there is no brighter or clearer light than that to illumine the truth.

Prologue

The fervent wish of sailors, as their journey nears its end, is to reach port safely. So amidst surging billows and tempestuous winds they spur on their steeds made of wood and iron and held together by nails. They fly over the mounting waves until, finally escaping the troubled waters, they race to their homelands. They tell their loved ones how they braved the fearful tumult of the sea in order to come back home with the spoils of their perilous sea journey. With their profits they settle debts, free their families from servitude to kings and overlords, and make a name for themselves as being generous and rich.

Such people risk their lives not because they are greedy, but because they really want to make their lives better. Some of them then use their wealth for their country's good. They give the king treasures of every description. They create jobs for the poor; from their sea journeys they bring back new and wonderful things such as herbs that are beneficial to health. And for this they are willing to put themselves at the mercy of the sea, and allow the tumultuous winds to plot their course.

Like them, the one who writes this history now sets sail on the perilous sea of wisdom. Like them, the writer is at the mercy of another power that of the princes who

command that an account of past events should be written. It is impossible to oppose royal commands, so here is the history, written to show forth the glory of God's workers, the saints. They shine like the priceless pearls, adorning the crowns of kings and consoling, refreshing, enlightening even the poorest in the kingdoms. They give rest and hope to the work-worn, and enrich the land by their prayers. They are guideposts on the road to God's Kingdom. They were tortured and died for God, and they gained life, leaving the fruits of their triumph for us to enjoy. They fed the hungry, clothed the naked, and opened the gates of Christ's compassion to all of us. They battled through the sea of sin, and when they reached the heavenly port they offered the King of Light their prayers for us. Through their intercession we receive God's mercy and love. And what can we offer to be worthy of such a gift? Only a heart ready to hear God's word. If we bow our heads we will receive the spiritual crown. If we merely wash ourselves of sin, we will be clothed with an everlasting shining garment that makes us more splendid than the lily. If we just let ourselves be thirsty for His love, a living spring will satisfy us eternally.

From these historical writings, readers may gain some spiritual wisdom. Therefore I have set them down, I, Agathangelos from the great city of Rome and trained in the art of the ancients, proficient in Latin and Greek, a not unskilled literary practitioner.

And so we come to the Arsacid court during the reign of Drtad, who has ordered me to narrate not a false account of his brave deeds, but what really happened in the battles, the plundering of provinces, the capture of towns, the struggles of men for renown or revenge. Here are the deeds of the brave King Khosrov, and the equally valorous exploits of his son Drtad, and the works of God's beloved martyrs who rose like stars to scatter the mist of darkness from this land of Armenia. These martyrs died for God's truth, and He had mercy on the land, showing miracles through one man who endured countless afflictions and then triumphed for Christ, even making the mighty Drtad accept a salvation he had known nothing about.

This history will tell how the teaching of the Gospel came to be honored in Armenia, by the king and then by all his subjects. We shall see how they undertook to destroy the pagan temples and establish the foundations of the Holy Church, and how they appointed a man as shepherd of the land and benefited by his teaching. We shall see how Drtad visited and made a covenant with Emperor Constantine, and returned to glory and honor, dedicating many places to God.

All this we shall relate in detail, with the teaching of St. Gregory who became bishop and inherited the patriarchal title as a champion of virtue who he was, and from what descent and family he came.

Then, when future generations look to their past, they will open this book and come to know what happened. They will read how the Gospel was preached in Armenia, and how a man appointed by divine grace did teach and endure tortures, and how by his love for God the cults were crushed. They will read how the first churches were built, and how the people were pulled from the treacherous sea of sin by his preaching.

Part 1

Artashir, a Sassanian prince from the province of Stahr, put an end to the Parthian kingdom when he murdered the Parthian ruler Artavan. He had united the Persian forces, and now they rejected Parthian sovereignty and chose him as their leader.

Khosrov, king of the Armenians, was greatly distressed by this news and soon took up arms to avenge Artavan's death. He gathered Albanian and Georgian forces, and called on the Huns to invade Persian territory. Khosrov and his armies ravaged the land, destroying towns and cities, trying to overthrow the Persian kingdom and wipe out its civilization. Even though the Parthians refused to help him, having attached themselves to Artashir, Khosrov was able to inflict devastating losses on the Persians.

Then Khosrov returned victoriously to the Armenian city of Vagharshapat to celebrate his conquests and reward his soldiers, whom he showered with gifts and sent home. He also honored his family's ancestral worship sites, with white oxen, white rams, white horses and mules, and he gave a fifth of all his plundered booty to the priests. He similarly honored the temples of the idol-worshipping cults throughout the land.

The following year, still full of his intoxicating victory, Khosrov called his armies together again, and for the next ten years they freely plundered all the far-reaching lands under Persian rule. So completely did they scatter the enemy's forces that finally the Persian king could stand it no longer. He called together all the governors, princes, generals, and nobles of his kingdom, and said to them: "If a man can be found to take vengeance against this bloody Khosrov, I will elevate him to the second rank in the kingdom. Only I will be above him, no matter how humble or

honorably his origin. I will bestow gifts and rewards without measure upon him if only
65305 he will avenge me!"

Among the king's council was a leading Parthian chieftain named Anak. He stood up, strode forward, and offered to carry out the king's wish. And the king said to him: "If you can manage this, Anak, I shall honor you with a crown". Anak agreed to the plan, asking only that the king look after the rest of his family during his absence.
65310 Then he and his brother, along with their wives and children, made their way to Armenia. Anak presented himself to King Khosrov at the winter quarters in Khalkhal, saying he was emigrating to Armenia in revolt against the Persian king. Khosrov received him gladly, honored him, and passed the long winter days with him in good cheer and happiness.

But when spring came, thoughts of the Persian king's promises stirred in Anak's mind. He began to yearn for his own country of Pahlav. So he made a plan with his brother, and together they got Khosrov alone as if they wanted to speak with him. Then they raised their swords and struck the king dead.
65315 When the Armenian princes realized what had happened, they split into groups to scour the countryside and find the killers. This they did, and cast them from a bridge into the swollen waters of the Araxes River. And then, according to the king's deathbed decree, they slaughtered the murderers' families. But two infant sons were saved by their nurses, one of whom fled with her charge to Persian and the other to Greek territory.

The Persian king rejoiced at his enemy's death. He took the opportunity to invade Armenia, correctly surmising that the stunned and grieving people would not offer much resistance. One of Khosrov's sons, Drtad, survived this terrible raid; his tutors took him to the emperor's court in Greek territory. Meanwhile, the Persian king imposed his own name on Armenia, sending the Greek army in retreat back to its
65330 own borders. He drove out the inhabitants of the land he had conquered and made it his own.

Drtad was raised and educated in the house of a count named Licinius. The other exile, Gregory, was raised as a devout Christian in Caesarea, capital of Cappadocia. In an effort to make amends for what his father had done, he offered himself to Drtad as a servant, without ever revealing his parentage. But Drtad had been taught to hate and persecute the Christian Church, and when he heard that Gregory belonged to it he made frightening threats, even imprisoning and tormenting Gregory in order to get him to renounce the worship of Christ, and worship instead the pagan gods of Armenia.
65335 At about the same time, the king of the Goths sent a message to the Greek emperor. It said: "Why should both our countries suffer the devastation of war? Instead, let you and I come forth as the single champions of our armies, and fight. If I win, your Greeks will submit to my rule. And if you win, my people shall become your subjects". The Greek king, not a physically strong man, was terrified by this proposal. He called all his troops and their commanders in from the fields of battle to meet with him. Among those answering the summons were the count, Licinius, and his soldiers, including Drtad. At a place where they camped overnight there was no forage available for the hungry horses. But there was a vast pile of hay locked in a pen with a wall so high that no one thought it could be breached. No one, that is, except Drtad, who climbed over and tossed back heaps of hay until there was plenty for all the horses.
65350 Licinius, amazed by this feat, hastened to meet with the emperor as soon as they reached him the next morning. He told the king what Drtad had done, and together they agreed that his young man from the family of the Armenian king must be the one to meet the challenge of the Goths. Drtad was called into the emperor's presence, and everything was explained to him. Having obtained his consent, the emperor arranged a duel for the very next morning.

So the "false emperor," dressed in royal purple and wearing the royal emblem, went out to meet the king of the Goths. He beat the king handily, and was duly honored by the Emperor. Drtad returned to Armenia with a great army. He beat back the Persians who had subdued his native land, and brought it under his own rule.
65360 During the first year of his reign, Drtad and his courtiers visited a provincial town to sacrifice to the goddess Anahid in her temple there. He ordered Gregory to venerate her statue, and when Gregory refused Drtad asked him: "You have served me well these many years. Why in this one matter do you refuse to do my will?". Gregory answered: "You speak truly. I have served you as God commands us to serve our earthly lords. But He alone is the creator of angels and men, of heaven and earth. We can worship only Him".
65365 Drtad frowned and said: "By saying this you render all your service to me completely worthless. I shall punish rather than reward you as I had planned. It will be prison and bondage for you unless you honor the goddess Anahid". Gregory replied: "My

65370 service to you is not worthless; God values it as He promised always to value our efforts for Him. It is He I seek to please. And if you punish me, I rejoice, for my lord Christ suffered affliction and death, and I will gladly follow Him into death so that I can be with Him in everlasting life. You speak of Anahit, and perhaps demons did once bedazzle men into building temples for them and worshipping them. But I will not worship lifeless objects of stone. We must worship the One who lives and gives life".

65375 Drtad then asked Gregory to tell him more about this living One. Gregory proceeded to explain that Christ is the Lord of creation and the true light for those in the darkness of idolatry. He exhorted the king to use his intelligence and put away the mulishly stupid devotion to mere images.

65380 Drtad exploded in anger. He shouted: "You have insulted the gods and insulted me by calling me stupid for worshipping them. You had the audacity to speak to me as if you were my equal. You said I was stupid as a mule; now you shall feel the burden of such words".

65385 With that he ordered Gregory to be bound and strung up, with a muzzle over his mouth and a heavy block of salt hung on his back. After a week of this torture Gregory was brought before the king, who said: "Now like a mule you have carried a load. But worse things can happen to you if you further insult our deities".

65390 Gregory, however, had not been subdued by his suffering. He told the king that he did not mind tortures, and that only those who worship idols need fear the Lord's wrath. So Drtad tortured him further, hanging him by one foot for seven days. But Gregory passed the time in prayer. He recalled in his prayer how God had prepared mankind for eternal life, a gift which we threw away with our disobedience. Yet God did not abandon us rather He sent the prophets, and finally His own Son, to show us His will.

65395 Christ became the image of God so that we, who love to worship images, might finally worship the Truth. He gave us a wooden cross rather than wooden idols. He called us to sacrifice as Christ had sacrificed, and to partake of His body and blood as we had once eaten sacrificial animals.

65400 After recalling these wonderful acts of God, Gregory asked Him for strength and grace to endure torments and to fight for the truth, receiving the crown promised to those who are steadfast. Then Gregory praised God's creation of the light and the darkness, with the sun and moon as their rulers. Finally, he prayed that his tormentors might be shown the truth, and turn from false worship, so that they could live everlastingly in God's Kingdom, along with those whose faith was always true.

65405 Even this terrible torture, which broke his body, did not sway Gregory. After a week of it, he was again brought before Drtad, who asked him once more to pay homage to the idols. Gregory again refused, and Drtad submitted him to many more hideous tortures. But Gregory withstood them all and told the king: "I can endure all this not through my own power but by the Lord's grace. Now you will see that nothing can separate us from His love".

65410 It was about this time that a prince of the court told Drtad that Gregory was the murderer Anak's son. Upon hearing this, Drtad ordered Gregory to be put in a deep pit until he died. As it turned out, Gregory would be there for thirteen years.

65415 Part 2

King Drtad spent much of his reign devastating the Persian kingdom. One of the proverbial sayings of the Armenians was: "Like the haughty Drtad, who in his pride devastated the dikes of rivers and in his arrogance dried up the currents of seas". He was exceedingly brave and daring, and also very proud. While Drtad was thus flourishing, Gregory continued to survive, though still in a pit that had killed all others condemned to it because of the filth, the snakes, and the stench. But Gregory was secretly fed by a widow who had heard God command her in a dream to toss a loaf of bread into the pit each day. So the two men, each in his own way, were moving toward the day when they would meet again.

65425 Drtad, still devoted to idol worship, remained an implacable foe of the Christian faith. He issued two edicts, one commanding his people to pay proper homage to the gods to insure that they would make Armenia prosper. The other edict instructed all citizens to reveal any members of the cult of Christians, because this cult was an insuperable obstacle to the proper worship of the gods. Drtad even threatened those who dared to hide Christians, and reminded his subjects of the severe way he had dealt with Gregory, a member of his own court. With Christians, there could be no leniency.

65430 During these days the Emperor Diocletian was seeking a wife. He sent portrait painters out into the kingdom to find lovely women and bring back portraits of them, so that from these pictures he could choose a beautiful wife for himself.

65435

The painters found, in the city, a group of nuns living a monastic life of constant prayer and ascetic fasting. Their abbess was named Gayane, and one of them, Hripsime, was very beautiful. The painters were quite taken with her, and rushed to complete her portrait to show to the king. He was so smitten that he immediately wanted to

65440 arrange a grand wedding. His arrogance and vanity led him to persecute the Christian churches in order to show his power over them.

This was all terribly upsetting to the nuns. They were saddened by the persecution of their fellow Christians, and worried by the king's unseemly interest in Hripsime. They prayed fervently to God that he would enable them, like the virgins in the

65445 parable, to keep their lamps filled with oil and that worldly cares would not distract them from His service. They asked for His protection against the pagan powers assailing them.

The women decided to flee, and that was how they came to be in Vagharshapat, the residence of the Armenian kings. They lived by selling the glass pearls which one of them made. But in the very same city, King Drtad received an emissary from

65450 Diocletian. He brought a royal edict which said: "Let my brother Drtad know of the evils that constantly beset us because of this error-ridden sect, the Christians. For they worship a dead man, adore a cross because he was crucified, and consider their own death on his behalf to be glory and honor. They teach dishonor for kings and hold as nothing the power of the sun and moon and stars. Everywhere among our people they discourage the worship of the gods, and our threats and punishments against hem are

to no avail.
"I happened to see among them a lovely young girl, and wanted to have her as my wife. But she and her companions have insulted my majesty by fleeing to the regions of your

65460 kingdom.

"So, my brother, find them for me and take vengeance. Send her back to me unless you wish to keep her for yourself. And may you be well by the worship of the gods". Drtad immediately ordered a search, and the nuns were soon found. For it was ordained by God that their light should not be hidden under a bushel, but shine out over the

65465 world. And since word of the emperor's edict had spread across the land, there were soon crowds of people straining to catch a glimpse of Hripsime's now-famous beauty. The nuns, whose only wish was to have a holy and solitary life, offered up constant prayers and lamentations to God.

Drtad, having heard from those who saw her that she was indeed a great beauty, sent a golden litter with attendants and filled with magnificent robes so that Hripsime could adorn herself and come to meet him in the palace. Seeing all this, the abbess Gayane told the younger woman: "Remember, my child, that you have abandoned your

65475 father's throne (for Hripsime was of royal lineage) and longed instead for the never-ending life of the Kingdom of Christ. Do not give up your choice now, and risk your holy virtue with these infidels".

Inspired by her abbess' words, Hripsime prayed intently, asking God to protect her as He had protected all the Old Testament people who faced danger. Her sisters prayed with her, and soon they heard a voice like thunder, assuring them of God's love and care. The thunderous sound caused panic among the throngs of people looking on they

65480 trampled each other in their confusion. But when King Drtad was told what had happened, he was not at all frightened. He was furious that Hripsime would not come to him, and ordered that she be brought to the palace by force. So she was dragged along, with a great crowd following, and as she went she prayed that like Daniel and Susanna, she would be saved from her tormentors.

Drtad, seeing her at last, was enthralled by her beauty and tried with all his great strength to seduce her. But Hripsime, delicate as she was, struggled against him so hard that he could not overcome her. Exhausted by his efforts, he ordered the abbess Gayane to intercede with the young nun and tell her to accede. But Gayane took the opportunity instead to strengthen Hripsime in her resistance to the king. Drtad's

65490 attendants beat and threatened her, but she persisted in encouraging the younger woman to stand firm and trust in God.

Hripsime did so for many hours, and then finally escaped from the palace. She ran through the city to the nuns' dwelling place to tell them what had happened. Then she went out from the city to a high, sandy point near the main road to Artashat. There

65495 she thanked God for keeping her safe. She prayed that soon she might be allowed to leave the temptations of the world behind and enter, by His mercy, the heavenly realm. She thanked Him for the certainty that if torments were to come, He would be there with her. Hripsime ended her prayer with these words: "Let the light of the Lord God be over us".

That very night, Drtad's men came and tortured Hripsime to death. Other followers of Christ were also killed, and so were many of those who came to wrap and bury their

65500

bodies. But all of them prayed to God and thanked Him for making them worthy of martyrdom. The king's men dragged their bodies out and threw them as food for the prowling dogs.

65505 Drtad was unashamed of what he had done. Indeed his heart was more inflamed against the Christians and especially against Gayane, who had counseled his wonderful Hripsime not to yield to him. He commanded that the abbess should be killed, and so she was taken to the place used for criminals' executions. But like her companions, Gayane was unafraid, and expressed her wish to join her sisters speedily. She died as
65510 they had, with a prayer on her lips.

King Drtad was not an introspective man, and after a week of grieving over Hripsime's death, he had to have some strenuous activity. He arranged to go hunting, and when the hounds and nets and traps and beaters were all ready, he climbed into his chariot to leave the city for the plain where he loved to hunt.

65515 Suddenly, Drtad fell from the chariot, as if struck down by a demon. He began to rave and grunt, like an animal. As their king was crazed, so all the people suddenly seemed to be, and there was chaos and ruin throughout the city and from the highest to the lowest of the king's household.

But one person had a solution. The king's sister, Khosrovitookht, had a heavenly
65520 vision which told her that only the prisoner in the pit, Gregory, could end the terrible nightmare. At first people said she too was mad; Gregory must be dead after so many years in the awful place. But the vision came to her again and again, and each time it disturbed her more. So it was finally decided to send one of the young princes to Artashat. When he arrived, the prince convinced some people there to lower
65525 long ropes into the pit, and he called out: "Gregory, if you are down there, let us know!" They felt a tug on the rope, and pulled it up out of the pit. There was Gregory, his body blackened by dirt to the color of coal. The people helped him get clean, and brought clean clothing for him, and he was taken to Vagharshapat with joy and high hopes that he could remedy the situation there.

65530 A pitiful sight greeted him in the great city: the people, raving and foaming at the mouth, rushed toward him like wild dogs. He knelt and prayed, and at once the people regained at least enough of their senses to listen to him. The king knelt before him and begged forgiveness. But Gregory pulled Drtad to his feet and said: "I am just a man like you. The One who has had mercy on you is your creator, the Lord and Creator
65535 of all things".

Gregory gathered up the remains of those who had been martyred; no dog had touched the bodies, and they were not decomposed and he enshrouded them and took them to the nuns' former dwelling place. He spent that night praying for the salvation and repentance of the Armenian populace. The next morning, Drtad and a great crowd of
65540 people came to see Gregory, and asked him:

"Intercede with your God to save us, and not let us perish for all the crimes we have committed against you". For they realized that whenever he left them for a moment, the demons assailed them again.

Gregory answered: "You say 'your God', but the One you speak of created all things
65545 and is your creator. Recognize Him, as Father, Son and Holy Spirit, and you will have everlasting life with Him. Do not be like those who, even though they are His creatures, fail to recognize Him.

"You see how much He loves those who believe in Him. He kept firm the maiden Hripsime so that she could fulfill her vow of chastity. Even to such an unworthy one as myself
65550 He gave the great privilege of suffering for His sake, and He granted me the endurance to survive.

"Now recognize Him, and throw off the yoke of evil. What you did to Hripsime and the others you did in ignorance. Ask them to pray to God for His mercy on you. Know God; put away your idols. He is long-suffering, pardoning, and nourishing in His mercy,
65555 and He cares for you all.

"God calls you; that is why He sent the martyrs to shine their light among you. They were witnesses to the majesty of the Trinity, and sealed their faith with martyrs' deaths. Recognize what they were showing you: that the Son of God humbled Himself in death so that we might be exalted. You tortured me, but my sufferings did not kill
65560 me; they exalted me instead. I endured so that, by His will, I could offer you spiritual healing. Now will you hear the teachings of the Lord?"

All the people fell down, and tore their clothes, and said that they did want to hear God's word so that they might live and be pardoned for the things they had done to Gregory. He began to teach them.

65565 "You have seen the power of God. For who but the One who made all things could change their character as He wishes to? Yet God changed the poisonous snakes in the pit into harmless creatures for your sake so that I, his unworthy servant, would be saved and

you would see the power of His miracles. And you saw a young girl defeat a powerful giant of a man, your king. She was martyred so that you might be healed. These are God's mighty works, done for your sake.

"And if you will turn to Him, then I shall gladly tell you how He made the world and showed Himself in it. For even though we cannot know Him, being only creatures, still He sent men called prophets to tell of eternal and divine life. They were men of the pious race of Hebrews, the seed of Abraham who is called the father of all races. Among these luminous men who spread God's words was one called Moses. He handed down true knowledge through the generations. So by the grace of the Spirit will I also try to teach you, trusting that He will place the proper words in my mouth. Let us begin".

Part 3

So Gregory taught the people about God and His desires for our salvation. Then he urged the people to build chapels for the martyrs, as a way of showing reverence for God and in order that the saints' intercessory prayers would enlighten them. He encouraged them to fast, study, and pray to become ready for baptism, and become worthy partakers in God's life and His eternal Kingdom. Having said all this, he sent them home to get a good night's rest before beginning the work of building the martyrs' sanctuaries.

But King Dardanus and the nobles would not leave Gregory's side because they were still fearful and tormented. Day and night they fasted and sat on ashes, dressed in hair shirts. Gregory used the time for they were like this for sixty-five days to tell them the whole long history of God's salvation for mankind. Many other people also came to hear Gregory's tales of the saints and his explanations of the word of God. They were a huge crowd, attentive and filled with wonder at what they were hearing.

On the morning of the sixty-sixth day, the king and nobles and the crowd with them approached Gregory and begged him to free them entirely from the torments which had beset them all this time. The king especially was eager for this, because his form was still more like a beast's than a man's. But it was God's will not yet to heal them completely, and to give them only enough understanding to comprehend Gregory's teaching. One way he taught them was by describing a wonderful vision which had come to him, concerning the chapels for the martyrs.

Gregory said: "One night I heard a fearful thunderous sound like roaring sea waves. The firmament of heaven opened, and a man descended in the form of light. He called my name; I looked up and saw him and fell to the ground, struck by terror. But he commanded me to look up and see great wonders.

"I did look up, and saw the firmament opened with the waters above it divided as is the firmament itself. The waters were like valleys and mountaintops, with infinite expanses that went far out of sight. Light flowed down to the earth, and the light was filled with shining two-winged creatures, human in appearance and with wings like fire. Their leader was a tall and fearful man who carried a golden hammer. He flew down near the ground in the middle of the city, and struck the earth. The rumbling sounded even in the depths of hell, and as far as the eye could see the earth was struck as level as a plain.

"I saw him in the middle of the city, near the palace, a circular base of gold as big as a hill, with a column of fire on it. On top of the column was a capital of clouds, and above that a cross of light. There were three other bases at the sites where St. Gayane and St. Hripsime were martyred, and one near the wine press where the nuns lived. These bases were blood-red, and they had columns of clouds and capitals of fire. From the columns, marvelous vaults fitted into one another and above this was a dome-shaped canopy of clouds. Under the canopy were thirty-seven holy martyrs in shining light. I cannot even describe them.

"At the summit of all this was a wonderful throne of fire with the Lord's cross above it. Light spread out in every direction from it. And an abundant spring gushed forth, flowing over and filling the plains as far as one could see. They made a vast bluish sea, the color of heaven. There were numerous fiery altars shining like stars, with a column on each altar and a cross on each column.

"There were herds of black goats, which when they passed through the water became sparkling white sheep. They gave birth to more sheep, filling the land. But some of these crossed to the other side of the water and became brown wolves which attacked the flocks. But the flocks grew wings and flew up to join the shining host, and a torrent of fire carried away the wolves.

"I stood amazed at this sight. And the man who had earlier called my name and said: "Why do you stand gaping? Pay attention to what is being revealed to you. The heavens have been opened! Here is what the vision means. The voice like thunder is the

beginning of God's mercy raining down upon mankind. The gates of heaven are opened, and also the waters above them. There is nothing to keep us mortals from rising up, for those who were martyred here have made a path for others.

"The light filling the land is the preaching of the Gospel, and the fearsome man is the providence of God, who looks on the earth and it trembles, who touches the mountains and they smoke, as the psalm tells us. This fear of God has flattened and destroyed error on the earth.

"The golden base is God's true Church, gathering all His people, and the shining cross above it is Christ Himself. The three blood-red bases are the martyrs' torments. But the columns of cloud show how quickly they will rise to heaven at the universal resurrection. The capital is fiery because they will love in the fire of divine light. And the crosses show that they are fellow sufferers with their lord Christ.

"The vaults joining the columns show the unity of the Church, and the cloud canopy above shows the gathering place of all believers, the celestial city. The throne, above which the whole structure is held together, is almighty God, the head of the Church. The shining light around the throne is the Holy Spirit, who glorifies the Son. The spreading waters are the grace of the Spirit, which will save many through baptism and make earth like heaven (that is why the plains became the color of heaven.) The herds of goats are sinners, washed clean by God's mercy, and worthy of His Kingdom. The flocks of sheep give birth because many generations will hear the preaching of the Word; but the flocks that became wolves are like those who depart from the truth. They lead sheep astray with their falsehoods.

But the sheep that endure will rise to Christ's Kingdom, and the wolves will be handed over to eternal fire."

Gregory continued: "And when he had told me the vision's meaning, he said to be strong because I had a great task. I was to build a temple to God on the place where the gold base had been shown to me, and the martyrs' chapels in the places where they suffered and died. After he told me all this, there was an earthquake, and I could see him no more.

"God showed me this vision of the future so that I could do His will among you. Let us go now and build the chapels, giving the martyrs rest".

"So all the people took up tools, and gathered materials, and set to work. Gregory himself took the architect's measuring line and laid out the foundations. They built three chapels, and made a casket for each saint's body. After Gregory had sealed the caskets, the king and people brought sweet oils and incense and rich robes. But Gregory said: "I am glad to see you honor these saints. But do not offer gifts to the holy ones until you have been purified by baptism. One day, we shall use all these beautiful things to adorn God's altar. But until true worship is established in this land, let them remain in the royal treasury".

The time had come for the king and all the people to be completely freed from their tormenting demons. Gregory knelt by the saints' caskets and prayed for Drtad and all the rest. Then he turned to the king, and by Christ's grace cured his hands and feet enough so that he was able with his own hands to dig graves and bury the caskets in them. His wife Ashkhen and sister Khosrovitookht helped him to arrange the places. With his prodigious strength Drtad carried stones from Mount Massis to make thresholds for the chapels.

When the chapels were ready, the martyrs were laid to rest in them. Gregory placed a cross in front of each, and told the people that the proper place for worship was in front of that saving sign of Jesus Christ. Then he took them to build a high wall around the place where the golden base had been revealed, for that was to be the site of the Lord's house. There too, a cross was placed so that people could worship God truly.

Gregory could see that the people were willing to heed his words, give up idol worship, and give themselves to study, fasting, and prayer. He gathered them to pray together for healing, and as they all prayed the king was fully restored to his human appearance, and the people were freed from their various afflictions. The news of this wonder spread through the land, inspiring people everywhere to come to Ayarat and hear about Jesus Christ, and learn how to live as He calls us to do.

Gregory then asked the king for permission to overthrow and destroy the pagan shrines and temples. Drtad readily issued an edict entrusting Gregory with this task, and himself set out from the city to destroy shrines along the highways. Together the men worked feverishly, and they distributed the temple treasures among the poor. In all the cities he visited, Gregory marked sites for Christian churches, but because he did not hold the rank of priest he did not erect any altars. At each place he set a cross, and he also placed crosses along roads and at squares and intersections.

65700 Drtad and his family members were then thoroughly instructed in the faith by Gregory. When they had all been convinced to worship the only true God, Gregory and Drtad began traveling to other parts of the country to instruct the people and to destroy the altars of the false gods. In many of the provincial towns, demons in the form of

65705 armed soldiers fought against the evangelist's efforts. They were put to flight each time, and then Gregory would tell the people not to be afraid, but to drive out their own personal demons of false worship, and follow Christ. He performed miracles to show the people how loving and powerful God is. And the king gave testimony about his sinful acts, and the miracles and mercy of healing which God had shown him. So they traveled through the provinces and everywhere they spread the light of the

65710 Gospel and destroyed the dark pagan superstitions which had held the people captive. After they returned to Vagharshapat, Drtad called together all his courtiers and the leaders from every corner of the land. The king wanted to make Gregory their pastor, so that everyone could be baptized and begin in earnest to live the new life in Christ. Gregory protested his unworthiness, but Drtad had a wonderful vision from God

65715 urging him to carry out his plan, and the angelic vision also appeared to Gregory, telling him not to thwart it. So Gregory said: "Let God's will be done". Drtad then chose some of the leading princes to take Gregory to Caesarea, in Cappadocia, with an edict for the bishop Leontius. The edict gave the whole history of Armenia's pagan worship, the suffering of the nuns, Gregory's witness and work

65720 among the people, and the king's own desire to have Gregory be the spiritual leader of Armenia. The group set off with Gregory in a royal carriage, taking along gifts for each of the churches they would pass. They were welcomed heartily in the land of the Greeks, who rejoiced to hear of God's miracles and the great conversion which had taken

65725 place. When the men reached Caesarea, Gregory was duly ordained, and the bishops laid their hands on him and prayed for him. He, too, was now consecrated as a bishop for God's church. With joyous and loving farewells, the nobles and Gregory set out for home, and as they stopped at various towns, Gregory persuaded some good Christian men to return

65730 with him and be ordained to serve the people. In all the towns, crowds of people gathered to see the new bishop pass, and to receive his blessing.

Part 4

65735 Back within the borders of Armenia, Gregory heard that in a certain region there was a large, richly-appointed temple devoted to the cult of Vahagn. It was on a mountain peak near the Euphrates, and contained three altars, one for Vahagn, one for his mother, and one for his spouse Astghig who corresponded to the Greek Aphrodite. People still made sacrifices at these pagan altars. Gregory had brought from Cappadocia some relics of John the Baptist and the martyr

65740 Athenogenes. He intended to take these up to the mountain, destroy the pagan temples, and build chapels for the relics there. But as his carriage neared a small valley, the horses halted and would not go any farther. An angel appeared and said: "It has pleased God that the saints should dwell here". So the entourage set to work and made a chapel for the relics.

65745 While they were doing so, Gregory took some of the men with him to destroy the pagan altars. Pondering as they might, they could not batter down the gates. So Gregory took the cross and held it up saying: "Let your angel drive the demons away, Lord". And a wind like a hurricane blew from the cross and leveled the altars so that later not a trace of them could be found. Many people seeing this came to believe in Jesus Christ, for as Gregory told them: "See, your stumbling blocks have been removed". It was on that spot that Gregory first laid the foundations of a church and erected an altar to the glory of God, and then arranged a baptismal font. He was with the people for

65750 twenty days, and more than one hundred and ninety thousand of them were baptized. This was the beginning of Gregory's effort to fill the land with church buildings and priests. And in each place he left a tiny portion of the saints' relics so they could be venerated.

65755 King Drtad, informed that Gregory was back in the country, set out from Vagharshapat to meet him. He had to wait a month, because Gregory was traveling far and wide to provide every region with churches and priests to do services in them, and was also

65760 baptizing scores of people. Finally Gregory did arrive, and the king went out to greet him on the banks of the Euphrates. Everyone was filled with joy, and the nobles who had gone with Gregory presented Drtad with Bishop Leontius' reply to his edict. In it, the bishop praised God's loving mercy in showing the Armenian people His will for them through the

65765 efforts of Gregory, whom they at first had despised but who became their spiritual

champion. The bishop quoted Scripture: "The stone which the builders rejected has become the head of the corner" (Matthew 21:42). He asked the new Christians to remember him in their prayers, and wished them well.

When the welcoming festivities were over, Gregory once again settled down to the task of instructing the people, and ever more of them came to learn how to live in a new way. Then he and the men he had recruited began a period of fasting and prayer, vigils and tearful repentance. The royal camp also prayed and fasted for a full month. Gregory built a church and placed in it the last of the relics he had brought to Armenia. When all this was done the month of preparation was completed, the whole royal camp went down to the Euphrates one morning at dawn, and he baptized them in the name of the Father, Son, and Holy Spirit. As this was being done, a bright light appeared over the water, with the cross above it. The people were amazed and blessed God's glory. That evening they went forth, more than one hundred fifty thousand new Christians, with lighted candles and in their white garments, praising God with psalms and prayers. They received Holy Communion in the new church which Gregory had built.

During the next week, Gregory baptized more multitudes of people, and he fixed a date for commemorating the martyrs. This date was the same as that of a former pagan festival New Year's Day. He then continued to travel around the land to give instruction and blessings to all the people, urging them to give up their old worship and pagan feasts, and come instead to know and worship the one true God. Gregory was especially concerned with leadership and education. He made sure that each church had a priest and each region had a bishop. Then he persuaded the king to gather peasant children from all over the country so that they, too, might learn from him and the men he had chosen. The king was willing also to have some children taught to read and become better acquainted with the Scriptures and other sacred writings. Some learned Syriac and some Greek, but all found new and precious knowledge in the word of God.

So Gregory's work continued. He spread the gospel message everywhere; he helped many in distress and despair, and established monastic orders in the populous plains and the isolated mountain caves. He educated many of the pagan priests' children and when they were ready he made them bishops of the Church.

The first of these, Albianos, was often left in charge of the court so that Gregory could retreat to a lonely place and live austere with pupils from the monasteries. They would give themselves to prayer and works of humility, proclaiming God's strength by their own weakness. They did the worship services together, studied the Bible, sang spiritual songs, and encouraged each other to live according to God's way rather than the world's. But Gregory was always ready to visit a city to work with the people in churches there, and met often with priests and bishops. He was their best example of how to live and do their work as the Lord would want, and constantly reminded them to teach others as Christ had done.

King Drtad lamented Gregory's absence very much, but at about this time he learned that from a youthful marriage Gregory had two sons, Vertanes and Aristakes. Both had been raised to be priests, but Vertanes was living a secular life. Armenia's light shone so brightly in the world in this wonderful time that other lands truly admired her and felt she was blessed. Everything was flowering, and the king continued to travel around the land to urge his people to follow Christ. But Gregory no longer went with him; instead he lived in the desert. Aristakes, on the other hand, was living a stringently ascetical life of prayer as a monk. Elated by the news, Drtad sent for them both. Aristakes was at first reluctant to leave his desert hermitage, but fellow Christians persuaded him to go and do whatever God called him to. As soon as they arrived at court, Drtad went out with them to seek their father. They found him on the mountain called the Caves of Mane, in the province of Daranalik. Drtad asked Gregory to make Aristakes a bishop, so he could carry on his father's work. This was done, and Gregory himself visited some of the churches he had established.

Drtad was also a tireless servant of the Lord, both in his witness to others and his personal spiritual life. He kept the feasts and fasts, asked forgiveness for his sins, and strove to do God's will. He used his royal authority to promote the teaching of the Gospel everywhere, and tried to be a living example of it for his people.

While all this was going on in Armenia, Constantine became emperor in Spain and Gaul. He was a Christian and made a covenant with his large and mighty army that they would work together to glorify God.

So with his soldiers, Constantine marched against the heathen king Diocletian,

marcianos, Macimianos, Licinius and Maxentius. He rebuilt the Christian churches they had destroyed during the persecutions, and built chapels for those they had martyred. He destroyed the temples of idols and took the cross as his sign. Constantine greatly fortified his rule over a large part of the known world, honoring all who worshipped the true God and fighting vigorously against all others.

King Drtad was eager to pay his respects to another monarch who believed as he did. He set out with Gregory, the bishops Aristakes and Albianos, and some of the highest-ranking members of his own court. As they traveled from Vagharshapat through Greek territory they were honorably received along the way, and when they arrived in Rome the emperor and the great Patriarch Eusebius greeted them warmly. After the lavish ceremonies, Constantine pressed them to tell about the miracles that had come to pass in Armenia.

So Drtad told his spiritual brother all that had happened, not even keeping back the details of his own bestial transformation. He spoke about the brave sacrifice of the martyrs, and introduced Gregory to the emperor as the man through whom God's will had been done. Constantine was amazed by the story, and humbly asked Gregory's blessing. The emperor was also able to tell Drtad more about the martyrs, whom he had known of while they were still in his land. He spoke of how he himself had come to know God, and made an alliance with his fellow king to keep the love of Christ as a bond between their kingdoms.

When they returned to Armenia, Drtad offered all the gold and silver gifts they had received to the service of the Church, and placed several precious articles in the martyrs' chapels. Gregory and Aristakes continued their travels and teaching across the land. It was Aristakes, too, who journeyed to the city of Nicaea when Constantine convened all the Christian bishops there for an ecumenical council. At that council, doctrines were expounded and canons were formed. Aristakes made these known when he came back to Armenia, further strengthening the Church and insuring good practices among the people.

Gregory continued his teaching and writing to make the faithful think about things of the Kingdom by his stories about things of this world. With fasting and prayers, taking only minimal rest, Gregory spread forth the word of the Lord until the end of his days. He had taught his students well, and they too spent time in reading Scripture and urging each other to follow the words of Saint Paul: "Take care for yourself and your teaching, and persevere in the same. If you do this you will save yourself and those who hear you". (Timothy 4:13-16). Thus it was that Gregory spent the days of his life in acts like those of the Apostles, following God's commands until he died. And immersed in the love of Christ, he shone forth to all.

Now according to your command, King Drtad, we have written all this down as a chronicle in the literary style of the Greeks. Like the Old Testament prophets and rulers, we have put down these events for future generations everywhere to read and learn from; we have not set them down from old tales but according to what we ourselves saw and heard. An like the writer Luke, we have put down the main points, not including each small detail but passing over some things and describing only those that are most important and illuminating. We have made our story not to honor those who have already pleased God with their service, but to inspire their children and all those in every land who will receive these words. May they come, one day, to say to Him, "You are our God," and hear His life-giving answer, "You are my people".

OVER DE GOUDEN HALSBANDEN EN RINGEN, TE VELP, BIJ ARNHEM, GEVONDEN

DOOR Dr. L. J. F. JANSSEN. CONSERVATOR BIJ HET MUSEUM VAN OUDHEDEN TE LEIJDEN.

Met afbeeldingen.

NIET AFZONDERLIJK IN DEN HANDEL.

TE ARNHEM, BIJ IS. AN. NIJHOFF. 1851.

Onder de zeldzaamste ontdekkingen, die in den jongsten tijd in ons vaderland hebben plaats gevonden, behooren de gouden versierselen, aan het hoofd dezes gemeld, en die hiernevens in naauwkeurige afbeeldingen worden uitgegeven. Die groote zeldzaamheid is oorzaak, dat wij de uitgave spoedig doen plaats vinden en van een kort ophelderend berigt vergezellen. Wij vonden daartoe te dringender aanleiding, omdat een vroeger bericht, door de nieuwsbladen verspreid, aan de onjuiste meening ingang moest verschaffen, dat die voorwerpen uit de riddertijden of van de eene of andere adellijke familie, dus van zeer laten oorsprong, zouden zijn (*). Eer ik tot de opheldering overga, zij vooraf openlijk hulde en dank toegebracht aan den heer Mr. T.

BRANTSEN, burgemeester van Reeden c. a., voor zijne medewerking ter voorkoming dat die voorwerpen nog niet verstrooid of in den smeltkroes geworpen werden, alsmede voor de gelegenheid waarin hij mij gesteld heeft om ze naauwkeurig

(*) Zie b. v. *Algemeen Handelsblad*, 1851 den 15 Januarij.

te onderzoeken, en, met bewilliging van den bezitter, onder mijn toezigt te laten afbeelden. Immers, wanneer ook de ophelderende aantekeningen van mijne hand geene waarde mochten hebben, zouden die afbeeldingen toch van groot belang zijn, omdat daardoor verhoed is, dat, bij mogelijk verlies van de oorspronkelijke stukken, de wetenschap niet al te zeer benadeeld zijn zou, en omdat door afbeeldingen van geheel éénige gedenkstukken, als deze, de bouwstof der archaeologie eene wezenlijke aanwinst erlangt.

Ik zal 1.) de ontdekking kort vermelden, met betrekking tot de juiste plaats en de wijze waarop de voorwerpen gevonde zijn, naar mededeelingen van den vinder en volgens autopsie; 2.) de gevonden voorwerpen beschrijven, in die bijzonderheden, die door de afbeeldingen niet konden worden aangewezen; 3.) over den ouderdom, de afkomst en de bestemming eenig licht trachten te verspreiden.

1.

Op den 16 Januarij 1851 werden, door den tuinman CARRO, te Velp, in den tuin van den heer J. J. JOBIUS [JORIUS], toevallig, bij het omzetten van den grond, gevonden: elf stuks gouden versierselen, zijnde hals- en vingerringen, allen aan een' der groote halsringen (zie Fig. 1.) hangende, en klaarblijkelijk met opzet, doch in ouden tijd in den grond gelegd. De diepte waarop zij gevonden werden, was ruim eene halve Nederl. El, en zij lagen op den gewonen zandgrond, waaruit de bodem daar bestaat. Eertijds was die tuin gemeentegrond; dicht bij de plek waar de voorwerpen lagen, waren de dorpsbewoners vroeger gewoon hun zand te halen; eerst in lateren tijd werd de grond gekultiveerd en ging in bijzonder eigendom over. De vindingsplaats ligt tamelijk hoog en schijnt vroeger nog iets hooger geweest te zijn dan thans; oogenschijnlijk is zij even hoog gelegen als de hervormde kerk, die er p. m. 250 el ten zuiden van verwijderd is. Noch onder, noch rondom de voorwerpen werd iets anders dan de gewone zandaarde gevonden; men ontdekte geene spoor van verbranding, noch eenig bewijs, dat de stukken oorspronkelijk in een' doek, kistje of dergelijke besloten geweest waren. Men heeft hiervan te meer zekerheid, omdat de geheele tuui en zelfs belende akkers na de ontdekking zorgvuldig zijn omgewoeld, in de hoop van nog iets te vinden, doch welke arbeid geheel vruchteloos is geweest. De juiste aanwijzing van deze vindingsplaats is niet zonder belang, omdat in het jaar 1715, ia hetzelfde dorp, eveneens een schat van antieke gouden voorwerpen gevonden is (beneden te vermelden), waaruit deze versierselen eenige opheldering erlangen.

2.

Van de elf ringen zijn er hier slechts acht afgebeeld, omdat vier in vorm en versiering aan elkander gelijk waren, zoodat er drie door verwijzing naar éene afbeelding genoegzaam kunnen gekend worden.

Fig. 1. Halsring; zwaar 7 lood 7 wigtje; gehalte 18 karaten; goudswaarde f95,50.

Fig. 2. Halsring; doch waarvan slechts het voorste gedeelte van den beugel afgebeeld is, omdat het overige geheel overeenkwam met Fig. 1; zwaar 5 lood 7 wigtje 3 korrel; gehalte 18 karaten; goudswaarde f71.

Fig. 3. Halsring; zwaar 5 lood 8 wigtje 3 korrel; gehalte 18 karaten; goudswaarde f72,05. Van deze soort zijn er nog drie, die niet afgebeeld zijn, omdat zij in vorm en versiering volkomen met dezen overeen kwamen. Slechts op één dier drie ontbreekt het kleine groepje versierselen, hetwelk op beide zijden van Fig. 3 gezien wordt. Het gewigt van den éenen dier drie is 7 lood 3 wigtje 8 korrel, de goudswaarde f91; het gewigt van den tweeden is 7 lood, 5 korrel, de goudswaarde f87,40; het gewigt van den derden is 8 lood 7 wigtje 7 korrel, de goudswaarde f 106,20. Het gehalte van allen is 18 karaten.

Fig. 4. Halsring; zwaar 4 lood 1 wigtje 6 korrel; gehalte 18 karaten; goudswaarde f51,55.

Fig. 5. Spiraal, als vingerring; zwaar 3 lood 9 wigtje; gehalte 18 karaten; goudswaarde f48,35.

Fig. 6. Fragment van een' ring, met opzet ineens gebogen, en zeer waarschijnlijk van een' ring als Fig. 4 of 5. Zwaar 7 wigtje 2 korrel; gehalte 24 karaten; goudswaarde f11,20.

Fig. 7. Vingerring, voorzien van een ovaal, uitgehold schild, waarin oorspronkelijk een gegraveerde steen zal gezeten hebben. De steen echter ontbrak bij het vinden, en had waarschijnlijk reeds ontbroken toen de ring in den grond geraakte, aangezien de

- 65965 vinder mij verzekerde, in de holte van het schild niets dan zand gevonden en vruchteloos naar het ontbrekende steentje gezocht te hebben. Deze ring draagt sporen van veel gedragen te zijn. Zwaar 1 lood 2 korrel; gehalte 24 karaten; goudswaarde f15,90.
- 65970 *Fig. 8.* Vingerring, op welks vierkant schild het borstbeeld van een' krijgsman diep (en creux) gegraveerd en van eene gepuntcerde lijst omgeven is; de krijgsman schijnt een barbaar  geen Romein, te zijn. Zwaar 1 lood; gehalte 18 karaten; goudswaarde f12,40.
- 65975 Uit deze opgave blijkt, dat de elf gouden ringen te zamen het gewigt hadden van 53 lood 4 korrel, ter goudswaarde van f652,95 (*), en dat zij van 18 karaats goud waren, met uitzondering van *Fig. 6* en *7*, wier gehalte 24 karaten was.
- (*) De waardering ia geschied door M. C. MENTE, goudsmid alhier.
- 65980 Alle voorwerpen droegen blijken van gebruikt te zijn, sommige meer, andere minder; de vingerringen *Fig. 7* en *8* het meest. Het ronde gedeelte van de beugels der halsringen had onderscheidene kleine bogten, die veroorzaakt konden zijn door dikwijls om- en afdoen, waardoor de beugels moesten verbogen worden, of door herhaalde drukkingen van andere voorwerpen, die er op kunnen gerust hebben.
- 65985 Allen zijn uit de hand bewerkt; zelfs het ronde gedeelte der halsringen is, blijkens kleine onevenredigheden, uit de band geklopt. Het platte gedeelte vertoont zich aan den buitenkant driezijdig; zie de doorsneden *Fig. 1. b, c* en *d*. De versieringen zijn er met een' stempel in geslagen, niet uit de hand gegraveerd, hetwelk vooral blijkt uit hare volkomene gelijkheid. Zij getuigen van veel smaak en kunstvaardigheid. De cirkeltjes op *Fig. 6* beviuden zich slechts aan ééne zijde, die de buitenzijde van den
- 65990 ring zal geweest zijn. Het borstbeeld op *Fig. 7* schijnt uit de hand gegraveerd te zijn.
- 65995 De sluiting der halsringen is bij allen dezelfde; te weten, een eikelvormig oogje (zie *Fig. 1a*), door hetwelk een puntig knopje gestoken werd. Voorts hebben de halsringen, vooral van voren en aan de buitenzijde, eene bruinachtige kleur, waaruit de goudsmid, die met de waardering belast was, het besluit opmaakte, dat zij oorspronkelijk opzettelijk gekleurd waren.
- 3.
- 66000 Om over den ouderdom, de afkomst en de bestemming te oordeelen, hebben wij, bij gebrek aan opschriftelijke stukken (gelijk munten en gedenksteen en zouden zijn), enkel de voorwerpen zelve tot gidsen, en zullen dus uit deze, vergeleken met andere elders gevondene, licht moeten zoeken.
- 66005 Onwillekeurig vestigt zich het oog in de eerste plaats op den vingerring *Fig. 7*, die van een borstbeeld voorzien is. Men hoopt, dat het portret erkend en door de geschiedenis geverifieerd zal kunnen worden. Maar in de ruwe trekken, waarin ziekt dat beeld verloont, hebben wij vruchteloos naar een bekend persoon gezocht. Een Romeinsch keizer is het niet. Het hoofd is voorzien van digte en kleine krullen, of van eene pelsmuts. Op borst en schouders ziet men vouwen van een' mantel, en mogelijk is onder zijne kin de bovenrand van een schild aangeduid. Het schijnt een barbaar te zijn, ofschoon ik de beeldtenis onder bekende barbaarsche vorsten niet gevonden heb.
- 66010 Men zal er echter eer een' barbaar dan een' Romein in vermoeden, omdat de bepaalde kenmerken van het Romeinsche karakter en kostuum ontbreken. Intusschen komen bewerking en vorm van den ring zelfen met die van Romeinsche ringen uit laten tijd overeen. In vorm en ruwe bewerking is hij bij voorb. gelijk aan den ring bij ARNETH, *Gold- und Silberwerke u. s. f.*, Tab. G, S. XX N° 152, S. 33, op welks vierkant schild de borstbeelden van Constantinus Jun. en zijne vrouw gegraveerd zijn; alsmede aan den ring uit *Louisendorf*, met het opschrift FIDEM CONSTANTINO, afgebeeld in mijne *Gedenkteeken der Germanen en Romeinen enz.*, Pl. XVI, 6-8, en aan eenen anderen uit dezelfde streek, volkomen gelijk aan den laatstgenoemden, in bezit van den heer P. C.
- 66015 G. GUYOT te 's Hage (*). Maar ik zou onzen Velpschen ring nog eer iets later, dan uit den tijd der Constantijnen afkomstig achten. Hiertoe dringt de overweging van den in 1715 in hetzelfde dorp gevonden gouden schat, waarbij èn munten uit den tijd der
- 66025 (*) De ring van den heer GUYOT werd in het jaar 1850 in de omstreek van Kleef gevonden en is zoo uitmuntend bewaard, dat hij als nieuw zou kunnen beschouwd worden. Daar er thans twee vingerringen gevonden zijn, geheel gelijk, ook wat het opschrift hetreft, en uit dezelfde streek, mag men veronderstellen, dat zij door een' der Constantijnen als *donaria* aan verdienstelijke bevelhebbers, waarschijnlijk van barbaarsche hulptroepen, geschonken zijn, gelijk, vooral in dien tijd, zeer veel plaats vond.
- 66030 Constantijnen waren èn ook latere, de jongste van den tiran Johannes, wiens laatste

- munt (MEDIIOBARBI, p. 537) van het jaar 425 is. Die gouden schat, niet onbelangrijk tot opheldering van onze versierselen in het algemeen, moge hier kort vermeid staan, te meer, omdat hij weinig bekend is, en uit Nederduitsch geschreven werken ook
- 66035 slechts onvolledig gekend kan worden. Men vindt er eenige berigten over bij ENGELBERTS, *Aloude staat*, IV. 336; G. VAN HASSELT, [Arnhemsche Oudheden](#), IV. 1-3; REUVENS EN WESTENDORP, *Antiquiteiten*. III. 148, waar nog wordt aangeroerd STARING, in de *Verh. der Haarlemsche Maatschappij*, XI. 451 (1822); IS. AN. NIJHOFF, [Wandelingen in de Omstreken van Arnhem](#), 5e uitg. bl. 107, waar nog is aangeroerd KILIAAN, *Etymol.*
- 66040 *voce* dondersteen; maar de meest uitroerige en meest gelijktijdige bescheiden vindt men in G. CUPER, *Lettres de critiques etc.*, Amsterdam 1742, 4° p. 179, en in de *saggi di Dissertat. Accadd. di Cortona*, tom. IV. p. 255 sqq. (Roma 1743, 4°), *Dissert.* YI*, sopra alcune medaglie d'oro, divisa in tre lettere, due di GISBERTO CUPERO ed una di Mr. FRANSISCO BIANCHINI.
- 66045 In beide laatstgemelde werken bevinden zich, t. a. p., ook twee afbeeldingen van medaillons van Honorius en van Galla Placidia, bij dien schat geronden (*). Uit deze bescheiden is ons navolgend bericht ontleend.
- Op het Laar(\$), te Velp, werd in het jaar 1715, door werklieden en soldaten, bij het omspitten en gelijkmaken van een onvruchtbaar en heuvelachtig stuk weiland (*sterile prato*), toebehoorende aan een' tabakskoopman, die
- 66050 (*) ARNETH, die in zijne *Gold- und Silberw.*, p. 7, dezen Velschen goudschat aanvoert als behoorende onder de belangrijkste goudvondsten in Europa, en die als zijne bron noemt de *Lettres de critiques* l. c., heeft verkeerdelijk als vindingsplaats *Velperg* genoemd, in plaats van *Velp*, en als beschrijver opgegeven CUPER GISBERT, in plaats van den bekenden geleerde GISBERT CUPER.
- 66055 (\$) *Laar*, oudd. *Lár* ~ woning, huis; zie GRAFF, *althochd. Sprachschatz*, II, 143; vergel. MEIJER *Zürich. Ortsnamen* S. 10 (1849); en L. P. C. VAN DEN BERGH, *Krit. Woordenb. der Ned. Myth.*, bl. 124.
- 66060 het tot tabaksland verbeteren wilde, een gouden schat gevonden ter goudswaarde van f10,000 tot f12,000. Hij bestond in een' halsband (*collier*), in armringen (*brasseletten*), in munten en medaillons. Alles lag in de losse aarde, maar de halsband en de armringen waren in de rondte gelegd; het midden van dit rondje was
- 66065 met de medaillons bedekt, die van sierlijke randen voorzien waren en die zóó naast elkander lagen, dat zij eene soort van vloer vormden, zijnde vijf dier medaillons nog aan de *collier* bevestigd geweest (*). Op deze medaillons waren de kleinere gouden munten, op den kant, naast elkander gezet. De vindere verdeelden den schat onverwijld, maakten zich er mede uit de voeten en verkochten het grootste gedeelte
- 66070 aan goudsmiden, die het in den smeltkroes wierpen, zoodat de gezamenlijke vondst door geen' kenner of liefhebber ooit gezien is. Intusschen had CUPERUS het voorregt, te Arnhem nog een dertigtal der gevonden gouden munten te bezichtigen en er zelfs twee van te kunnen koopen, ééne van Honorius en ééne van Valentinianus; de overige die hij gezien had waren geweest van Constantijn den Groote en zijne zonen, van Valens,
- 66075 Gratianus en andere keizers van dien tijd, alsmede een van Johannes. Ook zag hij te Arnhem nog enkelen der medaillons, met name een van Honorius en een van Galla Placidia (\$). Volgens de mededeelingen van CUPERUS (die als zegsman den Baron VAN SPAEN van Biljoen noemt), zouden de brasseletten en de *collier*
- 66080 (*) Hoe zulke medaillons aan de *colliers* hingen, daarvan zie voorbeelden in de *Hist. Ant. Mittheilungen* van het Genootschap voor Oudheden te Copenhagen, S. 97-98, fig. 1, en bij ARNETH l. c. Taf. G. L. p. 8.
- 66085 (\$) Deze beiden zijn in de voornoemde verhandelingen uitgegeven. Het medaillon van Honorius was toen in bezit van den burgemeester DE GROOT te Arnhem, en dat van Galla Placidia bevond zich bij den Baron VAN SPAEN te Biljoen. Later kwam de GALLA PLACIDIA in de verzameling van den heer VAN DAMME; zie ENGELBERTS l. c., en ging uit deze over in de Koninkl. verzameling te 's Hage; zie J. C. DE JONGE, *Notice*, p. 99.
- 66090 versmolten zijn. ENGELBERTS daarentegen berigt, dat de *collier* »nog als *doopstuk* bij zekere familie bewaard wordt." ENGELBERTS had het wel niet met eigen oogen gezien, hij geeft er ook geene beschrijving van en noemt de familie niet; maar zijne verzekering schijnt niet betwijfeld te mogen worden. Indien het *thans* nog bij eenige familie mogt bewaard zijn, zou deze zeker de wetenschap verplichten door daarvan kennis te geven (*). ENGELBERTS heeft nog berigt, dat de heer VAN DAMME »uit
- 66095 denzelfden omtrek (Velp) bezat, eene buitengemeen groote medalje van Constantijn den Groote, die echter niet aan de gouden *collier* bevestigd was geweest, alsmede een' zwaren gouden vingerring, of ring, versierd met ingewerkte beeldjes van de eerste Christenen (en?) met een' saphirsteen, verbeeldende de keizerinne Helena." Uit dit bericht schijnt men te mogen opmaken, dat ook die voorwerpen van Velp afkomstig waren.

- 66100 Ten aanzien van de vindingsplaats, het *Laar*, leest men nog bij CUPER, dat sommigen, wegens de heuvelen die vroeger op dien akker geweest waren, gemeend hadden, dat deze gouden schat van eene begraafplaats afkomstig zoude zijn. CUPER hield dit echter voor niet aannemelijk, omdat er, volgens hem, bij de slechting van den heuvel waarin deze voorwerpen lagen, niet de minste sporen van eene begraafplaats gevonden waren, en
- 66105 omdat het begraven met schatten in dien tijd bij de *Romeinen* niet meer in zwang was. Wij zijn het hierin met CUPER eens; doch mogen niet nalaten op te merken, dat het niet bewezen is, dat die schat er door Romeinen geborgen is geweest, en dat barbaren in dien tijd de gewoonte wèl hadden, om met hunne afgestorvenen schatten te begraven.
- 66110 —
- (*) Maar vermoedelijk bestaat het niet meer. Immers voormelde heer BRANTSEN zeide mij, dat hem flaaauw voor den geest stond, dat de *collier* in zijne familie geweest, maar dat zij ten tijde der Fransche overheersching tot geld gemaakt was.
- 66115 Men mag uit deze opgaven zonder vermetelheid besluiten, dat die goudvondst op het *Laar* uit de eerste helft der vijfde eeuw is, omdat de jongste der munten uit den aanvang der vijfde eeuw was. En hierin is de reden gelegen, waarom wij boven het vermoeden geuit hebben, dat onze gouden versierselen uit iets lateren tijd dan dien der Constantijnen zouden zijn. Immers men zal beide goudvondsten wel als gelijktijdig
- 66120 of nagenoeg gelijktijdig mogen aanmerken, omdat het *Laar* slechts 10 minuten van de plek waar onze voorwerpen gevonden zijn verwijderd is, en omdat beide vondsten geene sporen opleverden van begrafenis, maar wel, dat zij opzettelijk in den grond geborgen, niet bij toeval verloren geweest waren.
- 66125 De vingerring Fig. 8, waarin zich oorspronkelijk een gegraveerd steentje zal bevonden hebben, komt in vorm en bewerking zoo in het oogvallend met Romeinsche vingerringen overeen, dat wij daarvoor geene voorbeelden ter vergelijking behoeven aan te voeren. Anders is het echter gelegen met de overige versierselen, bepaaldelijk met de halsringen. Deze komen noch in vorm, noch in versiering met de ons bekende Romeinsche overeen. Op het eerste gezicht zou iemand zelfs vermoeden kunnen, dat zij veeleer
- 66130 hoofdringen, diademen, waren; immers hun vorm is *eenigermate* met dien van enkele diademen uit de klassieke oudheid overeenkomstig: zie b. v. afbeeldingen bij CAYLUS, *Recueil*, I. partie 4, ri. LXXXV, 4; MONTFAUCON, *Antiq. expliq.* III Pl. XX. en XXV, en BOLDETTI, *i cimiteri* etc. p. 526. Ook zeide mij onlangs de heer HIIDEBRAND, opzigter van het Museum van Oudheden te Kopenhagen, die (28 Aug. jl.) alhier de teekeningen
- 66135 onzer Velpsche versierselen zag, dat er in Zweden gouden diademen van *soortgelijke* vorm gevonden waren, welke men daar vermoedde van Oostersche afkomst te zijn. Intusschen waren die Zweedsche diademen voor zóó ver van de onze onderscheiden, dat zij van achteren digt en van voren open (perpendiculair doorgesneden) en daardoor elastiek waren.
- 66140 Intusschen zal men onze Velpsche ringen niet voor diademen kunnen houden, omdat het breede en platte gedeelte der beugels eene tegengestelde rigting heeft met de sluiting van achteren, in dier voege, dat, wanneer zij als diademen gebruikt werden, zij niet plat tegen het voorhoofd zouden liggen, maar met de scherpe punt der voorzijde het hoofd zouden verwonden; terwijl zij daarentegen, om den hals gelegd
- 66145 zijnde, zeer doelmatig met de platte voorzijde tegen het borstbeen sluiten, en het versierde gedeelte dan ook voor ieder zichtbaar is. Aan deze bestemming is niet te twijfelen, en wanneer daaromtrent nog twijfeling mogt overblijven, zoo zal die wijken bij overweging, dat gelijksoortige ringen elders nog om den hals van de lijken bevestigd gevonden zijn. Die elders gevonden ringen zijn echter weinig in getal en
- 66150 hoogst zeldzaam. Zij werden gevonden in een gewest, hetwelk tot nog toe voor de vergelijkende archaeologie weinig geraadpleegd is, en wij gaan tot de vermelding daarvan te gereeder over, omdat het de eenige voorbeelden zijn uit de gansche oudheid (voor zoo veel mij althans bekend is), die met onze Velpsche halsringen grootelijks overeenkomen.
- 66155 In *Lijfland*, ten oosten van de Baltische zee, werden in den jongsten tijd door DR. F. KRUSE, den onvermoeiden navorscher der monumentale oudheid, vele opgravingen bewerkstelligd, vooral ook in grafheuvels der oudste bewoners aldaar. De uitkomsten daarvan zijn door hem medegedeeld in het werk *Necrolivonica*, in 1842 te Petersburg uitgegeven. Daar vindt men, Tab. 4. fig. N. (vergel. p. 7 van den tekst), een'
- 66160 bronzen halsring afgebeeld, te *Aschenraden* in een oud graf gevonden en nog om den hals van het scelet bevestigd. Die halsring komt in vorm buitengemeen met de onze (namelijk Fig. 1, 2 en 3) overeen; hij is, even als de onze, van voren driezijdig uitgeklopt, terwijl het overige rond is. Slechts daarin verschilt hij, dat de versierselen niet geheel dezelfde zijn, en dat de sluiting niet juist van achteren
- 66165 maar ter regterzijde van den hals is, en er aan de breede voorzijde nog eenige bronzen kleppertjes aanhangen, die nagenoeg den vorm hebben van lepeltjes van antieke

haartangetjes (pincetjes). Deze laatste bijzonderheid doet echter aan de overeenkomst geen de minste afbreuk, omdat volgens KRUSE's berigten in *Lijfland* ook zulke halsringen zonder kloppertjes gevonden zijn. Te *Ronneberg* namelijk ontdekte hij, in een oud graf, om den hals van een mannelijk scelet, twee zulke halsringen over elkander; deze zijn t. a. pl. Taf. 27, fig. 8, afgebeeld. Een halsring te *Kerklingen*, in Kurland, gevonden en t. a. pl. Taf. 41, fig. 3, afgebeeld, is van voren, op het breede gedeelte, van eene versiering voorzien, die volkomen overeenkomst heeft met de driehoek-versieringen van onze ringen; doch die halsring is van achteren touw-vormig. Voorts is nog opmerkelijk wat KRUSE aangaande de versieringen op de Aschenradensche oudheden meldt. Die versieringen bestonden in het algemeen uit cirkelvormige oogjes (soms één oogje met dubbele omtrekslijn, soms twee enkele oogjes beneden en één er boven), uit zigzags en uit kleine vierkantjes. Zulke versieringen nu bevinden zich ook op onze ringen. Ten aanzien van de zeldzaamheid dier voorwerpen verklaart KRUSE, dat hem noch in Duitschland, noch in Scandinavië immer een ring was voorgekomen overeenkomstig met die van Aschenrade. Deze getuigenis beteekent veel in den mond van een' oudheidkundige, die zoo groote ervaring als KRUSE heeft. Wij veroorloven ons, er alleen nog bij aan te t, dat ons ook uit Brittanië (*), Frankrijk en België zulke halsringen niet zijn bekend geworden (§), terwijl de klassieke kunstge-

(*) Ten deze moet ik nog opmerken, dat, volgens ARNETH 1. c. te *Cornwall* in het jaar 1783 een gouden *torques* zou gevonden zijn, die aan eene zijde diadeemachtig breed was, afgebeeld in LYSONS, *Magna Britt.* III. p. CCXXI, en eene bronzen, afgebeeld in de *Archaeologia*, XIV, 94. Maar de in die werken voorkomende ringen hebben met de onze zeer weinig overeenkomst. (§) Men gelieve wel in het oog te houden, dat hierdoor geenszins ontkend wordt, dat de Germanen, Britten en Kelten, in die landen woonachtig, in het algemeen geene halsringen zouden gedragen hebben. Het tegendeel toch is genoeg bekend; vele zijn de bewijzen, daarvoor uit oude schrijvers en uit monumenten aan te voeren; wij besparen echter de behandeling hiervan tot eene andere gelegenheid, daar wij ons thans op korthed moetende toeleggen, slechts het noodzakelijkste, hier tot opheldering dienende, aanstippen.

wrochten uit Griekenland en Italië (de Etrurische daaronder begrepen) mede geene vergelijking aanbieden, dan de genoemde, weinig in het oog loopende, met enkele diademen (*). Uit het aangevoerde zal dan wel de uitstekende zeldzaamheid dezer voorwerpen gebleken zijn; zeldzamer nog dan de Aschenradensche bij KRUSE, voor zoo ver die slechts uit brons bestonden, de onze daarentegen van goud zijn. De weinige ophelderingen, die KRUSE over de afkomst en den ouderdom der Aschenradensche ringen heeft bijgebracht, kunnen ons van geene dienst zijn, omdat zij slechts bestaan in aanhalingen uit oude Noordsche en Russische schrijvers, betrekking hebbende op het gebruik van halsringen in 't algemeen en niet hooger dan de elfde eeuw opklimmende. Mogelijk heeft KRUSE geoordeeld, dat zijne Aschenradensche voorwerpen tot dien laat-middeleeuwschen tijd behoorden, ofschoon hij dit niet uitdrukkelijk zegt. In geval hij echter in die meening verkeerde, zou hij door onze Velpsche halsringen zeker tot een ander gevoelen geleid worden.

(*) Van verre mag er nog mede vergeleken worden een kleine, platte, diadeemvormige, gouden vingerring, bij Wijk bij Duurstede gevonden en thans in het Museum van oudheden alhier. Deze is van buiten versierd met driehoekige figuurtjes, van oogjes voorzien, en besloten in een' gepunteerden rand; hij is aan het smalle gedeelte open en dus elastiek, hierin niet de voornoemde Zweedsche diademen overeenkomstig, hoewel dáár de opening aan de breede zijde was. Deze Wijksche vingerring werd door den Zweedschen oudheidkundige, den heer HILDEBRAND, geoordeeld tot de vijfde eeuw te behooren. Voor den vorm van dien Wijkschen ring, vergelijkte men den armring bij WORSAAE, *Dänemarks Vorzeit*, S. 46, en voor de versiering S. 47.

Aangaande den bepaalden volksstam, waarvan zij zouden afkomstig zijn, brengt KRUSE mede niets in het midden. Maar indien de graven, die hij te Aschenraden vond, van een volk zijn dat dáár inheemsch was, dan behoorden zij onzes inziens tot een' Noordschen stam, want het is aannemelijk, dat de volkeren die oudtijds digt aan de oostkust der Baltische zee (en wel aan haar zuidelijk gedeelte) woonden, van denzelfden stam waren, als aan de westkust, thans tot *Zweden* behorende. Door MONE, *Gesch. des Heidenth.*, I.7,66, worden de Lijflanders, Ehistlanders en Kurlanders tot den Finnischen stam gebracht; maar zie over de oudste volken aan de Oostzeekusten vooral GRIMM, *Gesch. der deutschen Sprache*, S. 716 n. f.

Aan den halsring Fig. 4, die geheel uit rond geklopt gouddraad bestaat, moet, wegens gelijke sluiting en gelijk goud-gehalte, eene gelijke afkomst worden toegekend. Wij zullen daarbij niet uitvoerig stilstaan; hij is blijkbaar van de eenvoudigste soort; doch het was mogelijk, dat er oorspronkelijk versierselen aan hadden gehangen; daarvoor is althans die geheel ronde beugel zeer geschikt, en zulke ronde halsringen, met voorwerpen daaraan hangende, zijn soms gevonden (*).

66235 De zware spiraalring Fig. 5, die als vingerring kan gebruikt zijn, ofschoon hij door zijne grootte en zwaarte eenigermate de vrije beweging van den vinger moet belemmerd hebben, schijnt, even als de voorgaande, niet Romeinsch maar barbaarsch van afkomst of bestemming te zijn. Men zou hiertegen kunnen aanvoeren, dat de Romeinen in den
66240 lateren keizertijd de weelde in het dragen van vele en zware vingerringen zeer verdreven, en dat zij zonder smaak daarmede soms alle vingers, tot boven toe, bedekten; zie QUINTILIAN. XI, 3, MARTIAL. XIV, 123, en vooral XI, 59, waar hij met bitteren spot Zoilus geesselt.

(*) Bij voorb. in Normandië; zie de jaarboeken der *Société des antiquaires de Normandie*, 1827–1828, pl. 20 No. C. Tombeaux Gaulois-Romains.

66245 Zoile, quid tota gemmam praecingere libra
Te juvat et miserum perdere sardonicha?
*Annulus iste tuis fuerat mode cruribus optus,
Non eadem digitis pondera conveniunt.*

Maar spiraal-vingerringen zoo zwaar als de onze, zijn mij van de Romeinen niet bekend geworden, noch op beeldwerken, noch oorspronkelijke. Daarentegen zijn zij tusschen Germaansch-Noordsche voorwerpen gevonden. Wij willen slechts één voorbeeld vermelden,
66255 hetwelk de meeste overeenkomst met onzen ring aanbiedt. Op Fühnen werd in het jaar 1833 een gouden schat ontdekt, bestaande in armringen, brasseletten, mantelhaken, médaillons enz., tezamen 8 pond 7 lood (noordsch gewigt) zwaar; daartusschen bevond zich een zware, massief-gouden spiraal-vingerring, overeenkomstig met den onzen; zie de afbeelding in de *Hist. Antiq. Mittheilungen der Societät für Nord. Alterth.*, Taf. V, 13, vergel. den tekst S. 92–97. Die Fühnensche ring is slechts een weinig korter
66260 dan de onze, en aan beide einden dunner bijlopende; maar het was mogelijk, dat onze Velpsche ring oorspronkelijk ook aan beide einden iets dunner was geweest, en dat die einden er waren afgenomen tot handelsgebruik (zie beneden). Het verdient ook nog opmerking, dat de médaillons, waarmede de Fühnensche ring gevonden werd, barbaarsche nabootsing
66265 en waren van munten van Constans en andere opvolgers van Constantijn den Groote, en dat de geleerde Noordsche berigtgever op goede gronden vaststelt, dat die gouden schat, welke van Noordsch fabrikaat was, tot de vijfde eeuw moet gebragt worden (*).

66270 (*) Germaansche gouden spiraalvingerringen in het *Meklenburgsche* gevonden, zie vermeld en afgebeeld in het Frederico-Francisceum Taf. XXIII, 1, 4, 6–8, vergel. den tekst van LISCH, T. 137, 138, en LISCH, in de *Jahrbb. für Meklenb. Gesch. u. Alterth.*, W, 269, 270; en in het Holstein'sche, b[j RHODE, *Holst. Cimbr. antiq. Rom.* p. 137, fig. 1, 4, p. 142–143, fig. 2, 3. Alle die ringen zijn echter merkelyk dunner en fijner, dan de Fühnensche en onze Velusche.

66275 Deze overeenkomst met Germaansch-Noordsche ringen valt niet minder in het oog bij het versierde fragment Fig. 6. Want onder de voorwerpen van Fühnen bevonden zich vier even zulke afgebrokene en ineengebogene stukken van ringen (sommige spiraalvormig), die ruw als eene keten in elkaâr gehangen waren; zie de afbeelding in genoemde
66280 *Mittheilungen*, Tab. V. Fig. 15. Zeer teregt kenmerkt de uitgever die als «stukgeslagene, ineengebogene, en zamengeschakelde ringen, ten behoeve van het verkeer" (handel en roulage). Het ringgeld is bij vele oude volkeren in zwang geweest, niet slechts bij de Noren, maar ook bij de Kelten, en zelfs bij de Hongaren; zie korthedshalve SCHREIBER, *Taschenb. für Gesch. u. Alterthümer in Süddeutschland*
66285 1840, en *Nachtrag* in den *Jahrg.* 1841 S. 401.

Uit het tot dus ver aangevoerde zal men deze gevolgtrekkingen mogen maken.
1. De te Velp gevonden gouden versierselen zijn, wat hunne oudheid aanbelangt, met waarschijnlijkheid te brengen tot de eerste helft der 5e eeuw.
2. De groote ringen zijn halsringen van mannen geweest; waarvan er door éenen persoon
66290 meer dan één te gelijk (over elkander) kan gedragen zijn. Hierdoor wordt misschien ook meer duidelyk, waarom die ringen zoo gebogen en gedeukt zijn; immers mannen zullen daarmede ruwer hebben omgegaan, dan vrouwen plegen te doen; en zijn die mannen krijgslieden geweest, gelijk waarschijnlijk is, dan kunnen de ringen ook door wapentuig, hetwelk er op gedrukt kan hebben, gebogen zijn.

66295 3. De kleinere ringen zijn vingerringen geweest; wegens hunne grootte en zwaarte waarschijnlijk ook van mannen; terwijl de spiraal-ring en het gebogen fragment tevens bestemd zullen zijn geweest, om bij het verkeer, bij koop of ruil, in stukken gesneden te worden.

66300 4. De meeste ringen vertoonen in vorm en versiering eenen niet-Romeinschen barbaarschen stijl, en komen ten deze het meest overeen met voorwerpen uit het noorden, aan de kusten der Baltische zee gevonden.

5. Uit het niet-Romeinsche karakter der ringen is nog *niet met zekerheid* af te leiden, dat zij door barbaren zouden vervaardigd zijn; want het was mogelijk, dat zij door Romeinen in barbaarschen stijl vervaardigd en door de Romeinen als geschenken
66305 aan barbaren gegeven waren, om de gunst van deze te winnen, of hunne trouw te bcloonen, of hunne bedreigingen af te koopen; waarvan uit dien tijd eene menigte van voorbeelden in de geschiedenis gevonden worden (*)
6. De vroegere ontdekking, in hetzelfde dorp, van een' schat van Romeinsche munten, medaillons enz., zou misschien de meening kunnen versterken, dat de thans gevondene
66310 eveneens door Romeinen vervaardigd waren; maar het was ook mogelijk, dat die vroeger gevonden schat door barbaren van de Romeinen geroofd, of bij overwinning veroverd en tijdelijk daar ter plaats geborgen was. In dit geval zou men daaruit geen gevolg mogen trekken op de Romeinsche vervaardiging van onze versierselen.
7. De gelijke wijze waarop beide schatten in den grond geborgen waren, en de
66315 nabijheid van de bcide vindingsplaatsen, geven aanleiding om te stellen, dat beide schatten gelijktijdig, of bij eene gelijke gelegenheid en door dezelfde personen, of door personen van hetzelfde volk, begraven zijn. –
Ik meen mij als nog te moeten onthouden van gissingen omtrent den bepaalden
66320 volksstam, die onze versier-
- (*) Hoe afhankelijk de Romeinen toen van de batbaron waren, en wat al afgeperste geschenken hun deze kostten, daarvoor ia belangrijk de getuigenis van SALVIANUS *Massiliensis* (uit de vijfde eeuw), *de gubern. Dei*, VI. 211, p. 129 (edit. Brem. 1688). Voor het overige verwijzen
66325 wij naar GIBBON, *Gesch. des Röm. Weltreiches*, uebers. von SPORSCHIL, Leipz. 1840, Th. VII. Kap. LVI. S. 4–90, waar de voornaamste bronnen aangevoerd zijn.
- selen in den grond geborgen heeft. Hier ligt een tegroot veld open. Wat al volkeren toch uit het Noorden, Oosten en Westen hebben niet in de eerste helft der vijfde eeuw het Romeinsche Rijk bestookt! Het meer en meer zinkende Westersche rijk werd
66330 beurtelings door Geten, Gepiden, Avaren, Quaden, Alanen, Sueven, Wandalen, Franken, Hunnen, soms onderling bevriend, bestormd en ondermijnd (*), en Aëtius, van geboorte een Scyth (§), onder de tenten der Hunnen rijp geworden, heeft, aan het hoofd van het Westersche rijk gekomen (433–454), twintig jaren besteed alleen om diens val te vertragen, door het tegen barbaren te verdedigen, terwijl hij in vele veldslagen in
66335 Gallië (†) de Franken aan den Rijn en de Burgondiërs bedwong (**). Ik hoop ter geschikter tijd op dit onderwerp terug te komen en eene bepaalde gissing te kunnen aanbevelen. Thans veroorloof ik mij nog slechts de opmerking, dat er in den omtrek van Velp nog geene sporen gevonden zijn van eenen daar geleverden veldslag. Zelfs in het
66340 *onzalige bosch* is vruchteloos door mij naar ontwijfelbare grafheuvels gezocht. Ééne enkele doodurn, vroeger aan den *Essop*, naar men zegt, ontdekt (§§), en geringe overblijfselen van oude begrafenis, door mij in de lente van dit jaar in het zoogenaamde *Stadsbosch* bij Arnhem, boven Valkenhuizen, in een' heuvel opgegraven, bewijzen te weinig (††). De *Apeldoornsche* Germaansche graven liggen wat ver, en schijnen mij ook toe, we-

66355 (††) G. VAN HASSELT verzamelde op zijn landgoed *Daalhuizen* bij Velp, nevens zeldzame Romeinsche munten, ook urnen of lijkbussen en werpspiesen (*frameae*)" zoo als NIJHOFF, t. a. pl. bl. 89, naar de mondelinge mededeeling van den heer VAN HASSELT, verzekert; maar noch hun getal, noch soort, noch vindingsplaatsen zijn bekend, zoodat daaruit geene gevolgtrekkingen kunnen gemaakt worden.
- 66360 gens eenvoud van inhoud en gebrek aan wapentuig, onder dan de vijfde eeuw en niet van in een' slag gesneuvelden te zijn (*). Mogelijk zijn zij, die deze schatten in den Velpschen bodem borgen, van den linker Rijnsoever naar den regter, den Germaanschen, gevlugt, en hebben op deze eenzame plek, tusschen Rijn en IJssel, de lijdelijke
66365 bewaring veilig geacht. Met dit alles wordt de mogelijkheid niet ontkend van hetgeen aangaande den vroeger gevonden goudschat vermoed is, dat die namelijk een gedeelte van een' *keizerlijken schat* zoude zijn; maar ook in zulk getal zou hij zeker niet op last eens keizers geborgen zijn, die voor betere omkleeding zou gezorgd hebben, maar veeleer als ontvreemd, als geroofd, moeten worden aangemerkt.

66370

Leiden, den 15 Sept. 1851.

NASCHRIFT.

66375

Nadat het bovenstaande reeds grootendeels gedrukt was, vond ik, in heb bij ons te lande zeldzame werk Neues vaterländ. Archiv – von SPIEL, fortgesetzt von SPANGENBERG, B. IV. Heft 1 S. 184 (Lüneburg bei Herold 1823, 8°), een bericht aangaande de ontdekking van een' gouden schat in Hannover, zoo ver ik weet nergens elders vermeld, en waarbij zich een halsband bevonden, had, die eenige overeenkomst met onze Velsche schijnt gehad te hebben, en ook tot omstreeks denzelfden tijd behoord heeft. Wij

66380

(*) Zie, over die Apeldoornsche graven, mijn opstel: *Oud-Germaansche en Frankische oudheden te Apeldoorn*, in deze *Bijdragen*, D. VII. bladz. 320 en volg.

66385

laten dat bericht hier nog volgen, ook in de hoop, dat het medewerken moge om eene juistere en van eene afbeelding voorzien beschrijving van dien schat uit te lokken, of eene aanwijzing, waar men die kan vinden? Voormeld bericht is van de hand van Dr. KOELER te Zelle en luidt aldus: »Op den 31 Mei (1823) heeft de ontvanger CLAUS BÖSCHEN te Mulsuwer Wiede, in het ambt Dorum van het land Wursten, nabij het Hollseler bosch, in de streek van Heidestatt, bij het steken van plaggen, even onder de oppervlakte van den grond, een gouden versiersel gevonden van een' ouden aanvoerder uit den vóórtijd. Het is met de meeste waarschijnlijkheid voor een' halsband te houden en weegt omstreeks een half pond. Daar, waar het iets breeder is, zijn er tot versiering enkele kleine halve maantjes op aangebragt. Ter zelfder plaats vond men vijf stuks oude Romeinsche munten, allen van oogjes voorzien en die aan het dunne einde van den halsband schijnen gehangen te hebben. Men vindt daarop de namen van ANASTASIUS en VALENTINIANUS, en herhaaldelijk het woord victor en victori (VICTORINUS ?). Op eene, die de oudste schijnt te zijn en reeds tamelijk afgesleten is, bevindt zich een hoofd met het opschrift RESTITVTOR REIPVBLICAE en onder het hoofd ANT ... S. Wanneer dit ANTONIUS heeten moet, zou dat stuk ouder dan de christelijke jaartelling zijn. Elke munt weegt iets meer dan een ducaat, en de goudsmid verklaart, dat het goud van 24 karaten is. Vier er van en de halsband zijn van wege het geregt of de *Landstuba* aangekocht, en men zal deze stukken der oudheid waarschijnlijk aan het gouvernement, voor het Museum te Göttingen of voor eene andere openbare verzameling, aanbieden. De halsband is in twee stukken gebroken, en het schijnt dat hij aan de ééne zijde over elkaar gehaakt en aan de andere door twee schuivers (*Schieber*), die er nog op aanwezig zijn, bevestigd geworden is."

66410

17 december 1920 – In Westerkappeln (Westfalen) heeft men in een akker bij het graven een leemen vaas met 37 gouden munten gevonden. Men wierp de gebroken vaas achteloos weg, maar vond later op de plaats, waar ze gevonden werd, nog een ring met drie steenen en een bewerkt stuk massief goud. De groote, zware munten zijn van Romeinschen oorsprong en vormen een belangrijke aanwinst voor de numismatiek.

66415

12 augustus 2007 GOUDSCHAT VAN VELD BLIJKT VOOR EEN DEEL IN MOSKOU TE ZIJN!
De vroegmiddeleeuwse Goudschat van Veld, die in 1945 door het Rode Leger uit Berlijn is geroofd, bevindt zich in het Poesjkin Museum in Moskou. Dat meldt Jos Bazelmans, hoofd onderzoek van de Rijksdienst voor Archeologie, Cultuurlandschap en Monumenten (RACM). Hij zag onlangs de schat, die in 1851 is opgegraven en een paar jaar later aan Duitsland is verkocht, prominent vermeld in de catalogus van een tentoonstelling over Merovingische kunst in het Moskouse museum.

66420

Dat dit nu pas bekend is geworden heeft alles te maken met een stukje politieke openheid naar het westen door voormalig president Vladimir Poetin. De goudschat heeft nu twee kanten, archeologische erg interessant voor Nederland maar ook historisch beladen! Dit is eigenlijk ook weer historisch interessant omdat de reden dat de goudschat in Moskou ligt, te maken heeft met het afloop en de historie van de Tweede Wereldoorlog. De goudschat is in 1945 in kisten door de Russische troepen vanuit Berlijn mee genomen naar Moskou, als een van de goedmakers voor alle enorme schade die de Duitsers in Rusland hadden veroorzaakt. Omdat de schat destijds gekocht is door de Duitsers in Nederland, zal Nederland nooit aanspraak kunnen maken op de voorwerpen. De Duitsers zijn over teruggave of bijv. het aanmaken van replica's in onderhandeling met de Russen. Dit punt ligt, ook 65 jaar na dato, nog erg gevoelig. Vanuit de Gemeente Rheden is er al wel contact geweest met Poesjkin Museum in Moskou. Zuiver met de intentie om elkaar op de hoogte te stellen van de stand van zaken. Er zijn plannen om onder Duitse supervisie een Nederlands onderzoeksteam naar Moskou af te laten reizen voor verder onderzoek. Wordt vervolgt dus!

66435

Nederlandse archeologen willen de schat graag bestuderen, meldde donderdag emeritus

- 66440 hoogleraar archeologie Tjalling Waterbolk, omdat hij lijkt op andere goudschatten uit Nederland, zoals de door hem in 1955 opgegraven goudschat van Beilen. Bazelmans heeft aan het ministerie van OCW gevraagd ervoor te zorgen dat een Nederlandse archeoloog de schat in Moskou kan bestuderen. De goudschat van Velp is oorspronkelijk groter geweest en heeft naast deze penningen ook bestaan uit een groot aantal gouden munten, armbanden, halsringen en een gouden ketting. Alleen de muntsieraden zijn bewaard gebleven.
- 66445 DE SCHAT VAN VELP; GISBERT CUPER, FRANKEN EN ROMEINEN
Spreker: drs. P. Beliën.
De schat die in 1715 in Velp werd ontdekt is één van de meest spectaculaire schatvondsten die ooit in ons land is gedaan. Tijdens de lezing zal worden ingegaan op de ontdekking van de schat en wat er vervolgens met het goud uit de vondst
- 66450 gebeurde. Hierna wordt een sprong terug in de tijd gemaakt, naar het begin van de vijfde eeuw n. Chr. Dit was de periode dat de schat aan de bodem werd toevertrouwd. Geprobeerd zal worden de vraag te beantwoorden hoe het goud in Velp terecht is gekomen en wie de eigenaar is geweest.
- 66455 Er zijn in Velp op twee plaatsen gouden voorwerpen gevonden. De goudschat, gevonden bij de voormalige Villa den Heuvel, is deels dan wel geheel in Moskou te bewonderen. Een tweede vondst met gouden voorwerpen zou richting Parijs verkocht zijn. Hier is verder niets meer over bekend. Al met al een zeer internationaal schatverhaal!
- Germaanse halssieraden**
- 66460 In 1916 werden aan de uiterwaarden van de Gelderse IJssel bij Olst vier massief gouden halssieraden aangetroffen. Ze zijn omstreeks 400 vervaardigd uit omgesmolten solidi. Solidi, het meervoud van het Latijnse solidus, zijn laat-Romeinse gouden munten. In de Germaanse samenleving werd erg veel waarde gehecht aan edelmetalen sieraden. In het Britse heldenepos Beowulf (8ste eeuw) spreekt de maker goedkeurend over de vrijgevigheid van een koning die de beste strijder overlaadt met koninklijke geschenken:
- 66465 De goudschat van Olst staat niet op zichzelf; ook op andere plaatsen in Nederland zijn vergelijkbare vondsten gedaan. Zo werden in Beilen in 1955 vijf gouden halsringen en een armband aangetroffen. Deze goudschat telde ook nog eens 22 munten. Ruim een eeuw daarvoor, in 1850, waren er van deze vindplaats al een halsring en een munt bekend, die daarna weer kwijt zijn geraakt. Ook de halsringen van Beilen zijn in het midden verdikt en dragen typisch Germaanse versieringsmotieven. Er is berekend dat voor de zes sieraden uit de schatvondst van Beilen meer dan honderd solidi omgesmolten moeten zijn. De goudschat van Beilen is nu te bezichtigen in het Drents
- 66475 Museum te Assen.
- 66480 Andere vindplaatsen van dergelijke bijzondere sieraden zijn Rhenen, in de buurt van het vroegmiddeleeuwse grafveld, en Velp. Een deel van laatstgenoemde goudschat, gevonden in 1751, is in het Rijksmuseum van Oudheden: twee tot medaillons verwerkte penningen, die omstreeks 425 in Ravenna geslagen zijn. De goudschat van Velp is oorspronkelijk groter geweest en heeft naast deze penningen ook bestaan uit een groot aantal gouden munten, armbanden, halsringen en een gouden ketting. Alleen de muntsieraden zijn bewaard gebleven.
- 66485 De goudschatten hebben met elkaar gemeen dat ze aan het einde van de 4de eeuw of in het begin van de 5de eeuw in de grond terecht zijn gekomen. Wat de reden voor het begraven van dergelijke kostbaarheden is geweest, is niet met zekerheid te zeggen. In ieder geval moeten deze voorwerpen toebehoord hebben aan vooraanstaande Germaanse stamhoofden, die contacten met het Romeinse rijk onderhielden. Mogelijk hebben ze het goud gekregen als beloning voor diensten die ze de Romeinen geleverd hebben. Daarbij kan gedacht worden aan deelname aan militaire acties. Zo zullen de Germaanse stammen
- 66490 die de Romeinse rijksgrens tegen hun eigen soort beschermden zich ongetwijfeld vorstelijk, dus in goud, hebben laten betalen. Ook kan een hoofdman het Romeinse goud ontvangen hebben in ruil voor de belofte geen vijandelijkheden tegen de Romeinen te ondernemen.
- 66495 De grote politieke onrust, onderlinge strijd en invallende plunderaars ten tijde van de volksverhuizingen kunnen de eigenaar ertoe hebben gebracht zijn schatten te verbergen. Misschien nam hij zelf deel aan militaire expedities en moest hij daardoor een veilige bergplaats voor zijn kostbaarheden vinden. Misschien was hij daarna niet meer in staat de verborgen schat op te graven, bijvoorbeeld omdat hij gesneuveld was. Indien geen andere overlevende op de hoogte was gebracht, raakte de bergplaats van de
- 66500 schat in vergetelheid.
- Recentelijk heeft men op een andere mogelijke reden voor het begraven van dergelijke kostbaarheden gewezen. De goudschatten kunnen namelijk ook gebruikt zijn als offers

om de goden gunstig te stemmen, of om de steun van de goden in onrustige tijden te krijgen. Schitterende offers van prestigieuze halsringen (symbool van wereldlijke macht) en andere gouden voorwerpen verleenden aanzien aan hen die de goden zo vorstelijk eerden. De goudschatten uit het einde van de 4de en het begin van de 5de eeuw, die zowel ten noorden als ten zuiden van de Rijn zijn gevonden, weerspiegelen in ieder geval de onstabiele politieke situatie in deze periode. Bovendien tonen deze rijkdommen het streven van de Romeinen om door allianties de bedreiging van hun imperium door invallen van buitenaf te trotseren. Er zullen nogal wat geschenken aan te pas zijn gekomen om de relaties met Germaanse stamhoofden te verbeteren en de allianties in stand te houden. Uiteindelijk mocht het niet baten, want in 406 overschreden Germaanse stammen definitief de Rijn grens en kwam er in Nederland een eind aan de Romeinse overheersing.

66525 **Helena on the Move**

The Makings of a Medieval Saint Relics played a key role as early Christian veneration of the martyrs transformed and developed into the medieval cult of the saints.

Curiously, these material manifestations of the living presence of the saints on earth are remarkably uncommunicative objects by themselves. As has been argued by Patrick Geary, a relic has few properties that can directly convey a specific message compared to a text, an image, or an artwork.

The cultural significance of relics almost entirely depends on the external forces of a good story, a tradition to supply meaning. Hagiography makes up for what relics lack: clear links with the saint they represent, with communities of the faithful, and with the geographical locations where relics offer contact with the sacred.

This essay investigates the role of narratives about relic mobility in the creation of medieval sainthood. It pays particular attention to relics' connections with history and specific geographical locations, taking as its case-study Helena Augusta (c. 250-330), mother of Constantine the Great.

Today Helena's saintly status within Roman Catholicism is a widely accepted given; so much so, that assumptions about the universality of her saintly status are often erroneously projected back onto the late antique and medieval period.

In reality Helena's sainthood developed through a long and meandering process which gained speed only many centuries after her lifetime and lasted well into the seventeenth century. What little we know about the historical empress became interwoven with the legend(s) of the finding of the true cross soon after her death, but this did not immediately result in her sainthood in Western Christianity. Only

from the ninth century onward did Helena become venerated as a saint at an increasing number of regional cults, most notably in the Rhineland. There are very few signs that Helena was venerated in Rome until the late fifteenth century, but once her cult caught on there during the course of the sixteenth century, the omphalic quality of the eternal city seems to have eventually ensured her status as one of the most important female saints of early modernity.

The aim of this essay is to reconstruct Helena's route to becoming a key figure in Catholicism – honoured with a chapel and a colossal statue at Bernini's monumental crossing at St Peter's in Rome in the 1630s – by analysing the medieval history of her route to sainthood.

While the facts about her life, her role in the true cross legend, her cult in the Rhineland, and her legend in Britain have been studied, it remains unclear how and why Helena eventually became ever more universally venerated. The inventio crucis legend is often (somewhat vaguely) invoked as explaining her sainthood, but it does not provide clear answers.

Hagiographical mobility and relic mobility are crucial for understanding the development of Helena's cult in the West: the potential of her story and her relics to cross boundaries and to (re-)anchor at different locations.

In order to reconstruct Helena's trajectory to sainthood – from regional, to Roman,

to universally revered Roman Catholic saint – I first examine the life of the
66570 historical empress, giving particular attention to the places which she visited and
to how her travels were first construed as pious mobility. The following section then
elucidates how the finding of the cross legend magnified both her (perceived)
66575 historicity and her piety (and pious mobility), without making her a saint. The third
and fourth sections analyse how the core of Helena's medieval cult was first created
and was fundamentally characterized by narratives about relic mobility and border
crossing. As it developed through a complex conversation between various locations,
historical periods, literary forms, and (holy) objects, and by their transmission
across Europe, her cult crossed numerous boundaries – both geographical and temporal.
66580 Helena's relics acquired significance as they moved from place to place, and once she
became known as a supplier of Holy Land relics, links with Rome and Jerusalem became
increasingly important, too. By foregrounding the interplay between holy objects and
hagiography, a versatile, transregional paradigm of sainthood emerges. Helena's
circuitous path to sainthood showcases the dynamism of hagiography as an expansive
66585 generic category which encompasses dialogues between various types of texts,
including secular and sacred historiography.
It also emphasizes the importance of the interactions between these texts and
material culture (holy objects) as fundamental for the business of medieval saint
making.

66590 The Historical Helena
Helena's historicity provided a foundation for her cult as it developed in later
centuries. Historicity helped authenticate her as a saint. A real-life Christian
empress, whose ties with places such as Rome and Jerusalem were backed up by
66595 respected historical writings, could make for a much more convincing case. The
historical facts about Helena have, with time, become so entangled with historical
legend that (parts of) the legend have come to be – and sometimes still are –
accepted as historical truth. This has been discussed in several modern analyses of
Helena's life structured along the lines of 'fact and fiction' and 'truth and
legend'.

66600 It is worthwhile to briefly retrace the steps of this literature and to establish the
historical facts about her life before moving on to discuss its legendary aspects.
Only by first peeling off and then reconstructing step by step the intricate tissue
of multiple legends that surround Helena's person does it become possible to bring
into focus the process of hagiographic innovation which is the subject of this essay.
66605 We have little solid information about the historical Helena. Her place of birth is
unknown. Although several suggestions have been made – Drepanum (later called
Helenopolis [Hersek, modern-day Turkey]), various towns in Mesopotamia, Edessa,
Trier, and Colchester – none of these can be incontrovertibly substantiated.
The approximate years of her birth and death (c. 248/249–c. 328/329) can be
66610 reconstructed based on her age (around 80) at the time of her death, which occurred
shortly after her journey to the eastern provinces of the empire (c. 326–328), as
well as the sudden cessation in the issue of Helena-coinage after the spring of 329.
Contemporary sources say nothing about her social origins, while later sources
suggest these were humble.

66615 She may have been working at an inn, possibly as a prostitute, when she met
Constantine's father Constantius Chlorus (c. 250–306) in the 270s. The couple seems
to have had a stable relationship, which probably consisted of concubinage, an
arrangement which was usual for couples of unequal social standing. Constantine was
born at Naissus (Nis, modern-day Serbia) on 27 February 272 or 273. In 289
66620 Constantius married the more well-connected Theodora, a lady of imperial standing,
and Helena's whereabouts cannot be inferred until Constantine's succession of his
father in 306. She probably then joined her son's court, which first mainly resided
in Trier and later in Rome. Despite the suggestions of later traditions, no
substantial evidence of Helena's presence in Trier survives.

66625 As for Rome, sometime after 312 Helena owned a considerable estate southeast of the
city, the fundus Laurentus, which included an imperial residence, the Sessorian
palace, where she likely resided. She was certainly buried in the mausoleum on the
Via Labicana, located on the same fundus. Four inscriptions recovered in this area
attest to Helena's involvement with the water supply and reconstruction of a bathing
66630 complex known as the Thermae Helenae.
Helena's status increased significantly toward the end of her life. A small number of
coins, minted in Thessalonica with Helena's image and the inscription NF, suggest
that she had received the title Nobilissima Femina, indicating membership in the
imperial family. It is not clear when she received this title or when these coins

66635 were minted.
In 324, the year that Constantine became sole emperor, he granted both his wife Fausta and his mother the title of Augusta, symbolically sharing his power with them. Helena was thus raised to the status of empress. Large numbers of Helena Augusta-coins were minted all over the empire, typically with the legend *securitas reipublicae*. Combined with evidence from inscriptions, it appears that Helena had been allotted an important role in imperial propaganda as the matriarch of a stable dynasty and state.

66640
Appearances of stability were soon afterward seriously threatened when Constantine had his eldest son Crispus and his wife Fausta put to death in 326. The reasons behind these executions remain unclear; there is no evidence that Helena had a hand in them.

66645
This familial turmoil directly precedes the act for which Helena is most famous, her journey to the eastern provinces of the empire in c. 326/328. The only contemporary source that mentions her trip is the *Life of Constantine* by Eusebius, Bishop of Caesarea (c. 260/265–340). After discussing the discovery of the Holy Sepulchre in Jerusalem and Constantine's orders to erect a church over it, Eusebius briefly describes Helena's visit to the east, presenting it as primarily motivated by religious reasons. He suggests that she founded the Nativity Basilica in Bethlehem and a church on the Mount of Olives and describes her munificence to the inhabitants of the eastern provinces, especially the needy. Eusebius praises Helena's piety profusely and describes how Constantine honoured her memory with a stately burial in 'the imperial city' (meaning Rome, as elsewhere in the *Life*, but this would soon lead to enduring confusion with Constantinople).

66650
15 Based on Eusebius's account, Helena's journey has often been interpreted as a pilgrimage, motivated by personal piety. Eusebius's text cannot be taken at face value, however; it is a highly partial panegyric of the first Christian emperor and his pro-Christian policies.

66655
It casts Helena as the exemplary and pious Christian dowager empress in order to further accentuate her son's prowess and to celebrate his Church-building in the east. Several interpretations have emphasized the public (non-personal) nature of Helena's journey: an affair of state aimed at garnering support for the emperor in the east.

66660
Its religious overtones apart, Eusebius's account coincides with all the conventional trappings of an *iter principis* or imperial progress: the empress distributed gifts to the people and the troops, sponsored public building activities, and granted pardons. This much can be reliably established about Helena without overinterpreting or projecting back later traditions to the historical person. While she was not venerated as a saint or credited with miraculous deeds during her lifetime, it is possible to identify historical aspects which were to become important ingredients for her later legendary persona. Helena's historicity – as empress and mother of the first Christian emperor of Rome – could lend credibility to later traditions.

66670
Moreover, her documented presence at the important religious centres of Rome and Jerusalem could provide a basis not only for veneration in those cities, but also for cults further afield, wishing to invoke their sacred grandeur. Eusebius's account of her journey to the eastern provinces facilitated such long-distance associations, since he had – crucially – interpreted Helena's trip as a form of pious mobility. Mobility would go on to become a defining feature of her cult. Helena first became a saint through a narrative about relic mobility: the *translatio* of her relics from Rome to France. Later on Eusebius's piously travelling empress morphed into a major supplier of Holy Land and other relics. Yet the historical empress Helena could only transform into a travelling, relic dispensing saint after several layers of legend had been added to her story.

66675
The *Inventio* Legend: From Legendary Founder to Auxiliary

66680
The next, posthumous step in Helena's route to sainthood was shaped by the legend of the finding or *inventio* of the true cross. Its main holy protagonist is the cross; however, as its finder, Helena eventually also acquired a degree of saintliness by association. The medieval *inventio crucis* legend and the connected veneration of the cross were extremely widespread, complex, and diverse phenomena. I briefly analyse the legend's development in Western Christianity to illustrate how Helena – hitching a lift with the *inventio* legend – became a widely known quasi-saintly character. While the legend did not transform her into a saint directly, it did fortify the foundations for her later sainthood by magnifying both her (perceived) historicity and her exceptional piety. My discussion also aims to facilitate differentiation between Helena as cross-finder (an essentially auxiliary character) and Helena as a

66685
66690
66695
66700

saint in her own right, with her own vita, relics, and geographically anchored cults (which will be discussed in the next sections). Veneration of the cross apparently preceded the legend about its miraculous discovery. Its cult was first recorded by Cyril (315-386), Bishop of Jerusalem, who around 340 wrote in his Catecheses that wood of the cross was present and venerated in Jerusalem (presumably at the Holy Sepulchre basilica), and that from there pieces of it had spread all over the world. In 351 Cyril wrote a letter to Constantine's son, Constantius II (317-361), informing the emperor about the appearance of a luminous cross in the sky above Jerusalem, also mentioning the discovery of the cross in the same city in the times of the emperor's father. Helena is not mentioned. For comparison's sake, we can recall that Eusebius's Life of Constantine had neither referred to either (the finding of) the cross, or suggested any connection between it and Helena.

In any case, several other witnesses confirm that the cult of the cross had begun in, and was spreading from, Jerusalem during the second half of the fourth century. The earliest written evidence of the inventio legend which also involves Helena is found not in a hagiographical text (narrowly defined), but in a funeral oration: De Obitu Theodosii Oratio (395), which was delivered by Ambrose, Bishop of Milan (c. 340-397) forty days after the death of Emperor Theodosius I (r. 379-395). Towards the end, Ambrose imagines that Theodosius can now greet Constantine in heaven, thanks to the latter's deathbed baptism and having left a 'heritage of faith to princes'. Ambrose then refers to Zachariah 14. 20 and states that Helena fulfilled this prophecy. She travelled to Jerusalem and confronted Satan on Golgotha, accusing him of hiding the cross. By finding it she was the second to beat Satan (the first being Mary, by giving birth to Christ). Helena found three crosses and identified Christ's cross (the middle one, marked with the titulus crucis). She also looked for and found the crucifixion nails, which she has worked into the bridle of Constantine's horse and the emperor's diadem. According to Ambrose the nail in the diadem then transformed Roman emperors from persecutors to preachers of the Christian faith, and the nail in the bridle reined them in as Christians, thus fulfilling the prophecy in Zachariah 14. 20.

Ambrose thus attributes the consolidation of Christianity as the hereditary faith of the emperors to Helena. His extremely favourable account of Helena (overcoming Satan, comparable with Mary, founding the Christian empire) was likely directed at the women of the late Theodosius's court.

As co-foundress of the Christian Empire, Helena indeed went on to become a powerful and empowering model for Byzantine imperial ladies.

The initial lustre of Ambrose's Helena wanes in subsequent traditions, while at the same time the perceived historicity of the legend increased, since it was mostly discussed in historiographical texts. The next to record the inventio legend is the monk and theologian Rufinus of Aquileia (c. 345-411) in book X of his Church History (c. 402). In this version, visions inspire Helena to travel to Jerusalem, where a heavenly sign helps her find three crosses. To identify the right one, Macarius, bishop of Jerusalem, tests them on a dying woman, who is miraculously cured after touching Christ's cross. Helena then builds a church on the site of discovery and sends a part of the cross to Constantine (the other part remains in Jerusalem), as well as the nails (for his helmet and horse's bridle). She hosts and serves at a banquet for holy virgins. Rufinus may have translated/adopted the story from Bishop Gelasius of Caesarea's now lost Church History (c. 390), written at the request of this cousin Cyril, bishop of Jerusalem, which would point to a Levantine origin for the inventio legend.

However, adding Helena to the legend may have also been an original touch by Rufinus himself. Combined with the early interest in Helena as cross-finder shown by Ambrose of Milan (in 395), Paulinus of Nola (in 403), and Sulpicius Severus (in c. 403), a Western origin also becomes conceivable.

At any rate, the legend (with slight variations) also became known in the East, judging from the fifth-century Greek Church Histories by Socrates Scholasticus, Sozomen, and Theoderet of Cyrrhus.

On the basis of these histories, the Roman statesman and scholar Cassiodorus (c. 485-c. 585) compiled the influential Historia Tripartita, ensuring that a synthesis of these three Greek accounts of the inventio legend became widespread in the Latin west Europe.

Although the earliest versions of the legend feature Helena as cross-finder, she was

not the only character to play that part. The slightly later Protonike legend, first recorded in Syriac, has a fictitious empress called Protonike find the cross. Around 415-440, a third version of the legend appeared: the Judas Cyriacus legend.

66770 Although the oldest surviving witness of this legend is recorded in Syrian, it was likely first composed in Greek in Jerusalem.

In the Cyriacus legend Helena interrogates representatives of the Jewish population of Jerusalem about various scriptural prophecies, particularly a certain Judas, whom she eventually pressures into finding the cross for her through his prayer. Three 66775 crosses are unearthed, the true one identified by testing on a dead youth who is revived. Helena builds a church on the site of discovery.

Judas is baptized Cyriacus. When Helena looks for the nails, they are again revealed by Cyriacus's prayer. The nails are used for the bridle of the emperor's horse and kept as imperial trophies.

66780 In this anti-Jewish version of the legend the main character is Judas, an example of a Jew converting to Christianity, rather than Helena.

The Judas Cyriacus legend eventually became the most widespread version in the medieval West, thanks to initial dissemination via influential sources like the Roman Book of the Popes or *Liber pontificalis* and Gregory of Tours's *Ten Books of* 66785 *Histories*, as well as later via the *Legenda aurea* by Jacopo da Varazze (1229-1289) (see below).

Helena's occasional appearance in legends about other historical persons, such as myths about Constantine and/or Silvester (Bishop of Rome in 314-335), further 66790 magnified the (perceived) historicity of her persona.

These legends could add new details to her biography. For example, according to the Silvester legend Helena was Jewish. In it, Constantine is afflicted by leprosy. He refuses the recommended treatment of bathing in infants' blood, opting instead for baptism by Silvester, which cures him and convinces him to convert. Helena initially 66795 opposes his conversion, favouring Judaism instead, but eventually also converts.

The inclusion of both the Silvester and the (Cyriacus) *inventio* legends in the *Legenda Aurea* (1260s) compiled by Jacopo da Varazze firmly established Helena's status as a major saintly supporting actress. This extremely popular compendium (transmitted through about 1000 Latin and 500 vernacular manuscripts) does not discuss Helena as one of its 153 saints, but she is briefly mentioned in the readings 66800 about the birth of Christ, Silvester, Epiphany, and the exaltation of the cross. Helena figures most extensively in its *inventio crucis* legend, although she is arguably not the most important character in Da Varrazze's version.

Constantine sends her to Jerusalem to find the cross. Once there she rounds up all Jewish men, threatening to burn them all if they do not help her, and Judas is handed 66805 over to her. Helena starves Judas in a pit for a week, after which he agrees to help. Judas's prayer reveals the cross (and later the nails), he accepts baptism, and becomes bishop of Jerusalem. Helena sends a piece of the cross to her son, the rest remaining where it was found. Two nails are worked into the emperor's bridle, a third in a statue of Constantine in Rome, and a fourth is cast into the Adriatic to pacify 66810 the sea.

In the *Legenda* Helena has little agency: she carries out Constantine's orders, while Judas Cyriacus performs the miraculous findings. This is also, by and large, the Helena that made her way into various visual representations of the *inventio* legend, including monumental cycles like Piero della Francesca's *inventio*-cycle at Arezzo.

66815 In visual representations Helena often (but not always) appears haloed, and the *Golden Legend* occasionally calls her a saint.

Yet it was not the *inventio* legend that initially turned Helena into a saint, although it did play an important role in that trajectory. Since the legend was the stuff of church histories, it did magnify her historicity as well as her piety. It 66820 transformed Eusebius's piously travelling empress into a lady who purposefully went to the Holy Land to recover the cross. Moreover, it first added the dimension of relics to Helena's story. The relics she was said to have collected in the Holy Land do not (yet) travel far in the *inventio* legend: they stay in Jerusalem, go to the bottom of the sea, or are worked into objects for Helena's son to support the

66825 Christian empire (according to the version of the *Golden Legend*). At a later stage, Helena's potential as a mobile, travelling character who could supply Holy Land relics would become a central feature of her cult in Western Europe. This will be explored in the final portion of this essay, but first we examine how Helena did in fact become a saint.

66830 Helena's Move to Sainthood

Narratives about relic mobility and relics' meaningful connection to geographical

place are crucial for understanding how Helena's cult first began. Pre-existing legend/history also mattered: the inventio- and related legends established Helena's image as a devout historical figure, but perceived 'history' by itself was not enough and it initially did not lead to veneration in the West. In what follows I trace the (legendary) fate of Helena's own bodily remains in order to elucidate how stories about relic mobility and the crossing of boundaries were crucial for the creation of her sainthood. The hagiographical narrative in question did not concern a cross relic, but rather Helena's body, which had been interred in Rome. Following her death in c. 328-329 Helena was buried in the imperial mausoleum just outside Rome at the third mile of the Via Labicana (situated on the fundus Laurentus formerly owned by herself). While both this mausoleum and the porphyry sarcophagus in which she was buried may have originally been intended for a male member of the imperial family, it is clear that she was buried here. This is confirmed by sources such as the *Liber Pontificalis* which reports that during the pontificate of Silvester (314-335) Constantine built a basilica for Marcellinus and Petrus 'ubi mater ipsius sepulta est Helena Augusta, via Lavicana millario III'. He also endowed the site with precious gifts 'for the love of his mother and the veneration of the saints'. Three seventh-century pilgrims' guides to Rome also link this location to Helena, referring to it as ad Helenam, ecclesia Helenae and sancta Helena in sua rotunda; 'church of Saint Helena (Sancta Elena), where her body lies'; and 'Beata Helena'. The epithets sancta and beata in these seventh-century guides have been interpreted by Seelinger as possibly already indicating saintly holiness instead of imperial titlature, especially combined with a Greek graffito at the site which invokes 'Saint Helena'. This may possibly suggest veneration of Helena in Rome while the city was under Byzantine overlordship. However, if Helena was venerated in Rome during the early Middle Ages, her cult does not seem to have been embraced with much enthusiasm. This is corroborated by liturgical sources: Helena is not included in the Roman Canons of the Mass. She does not appear in liturgies of the cross or in martyrologies until the ninth century; these later inclusions stem from her Carolingian cult. Even more telling is the obscure fate of Helena's remains in and around Rome. The status of the mausoleum-cum-catacombs complex (also called inter duos lauros) at the Via Labicana gradually declined. In 774 Pope Hadrian I still ordered a renovation of the cimiterium of Marcellinus and Petrus and during the pontificate of Stephen IV (816-817) new gold decorations for the basilica beatae Helenae are reported. The translatio of the relics of Marcellinus and Petrus to Seligenstadt in 827, famously ordered and recorded as a *furtum sacrum* by the Carolingian court historian Einhard (c. 775-840), marks a turning point in the prestige of the complex. Not long after this, around 840, the theft of Helena's remains and their transportation to the abbey of Hautvillers in France was reported by a monk of that abbey (who may have been writing decades after the event). The mausoleum seems to have nevertheless remained in use until the middle of the twelfth century, when Helena's porphyry sarcophagus was moved to the Lateran basilica so that Pope Anastasius IV (d. 1154) could be buried in it, a repurposing which bespeaks little respect for either the empress or (possibly) the saint. The site subsequently became ruinous, was used as private residence and stone quarry, and memory of Helena's burial there was lost until rediscovery in 1594 by catacomb-explorer Antonio Bosio (c. 1575-1629). What stands out about the removal of Helena's relics to the city of Rome is that the event hardly caused a stir. A single thirteenth- to fourteenth-century liturgical manuscript from an abbey in Castel Sant'Elia (Viterbo) briefly records the event. It contains readings for Helena's feast (based on Altmann of Hautvillers's vita), and concludes with a supplementary reading which relates that during the Pontificate of Innocent II (1130-1143) Helena's mausoleum was plundered for precious materials. Helena's head and larger bones were then brought to the city for safety first, while the smaller bones later went along with the sarcophagus to the Lateran's, from where they were distributed among various churches. However, where exactly the relics went within Rome is far from clear; contemporary translatio-narratives triumphantly claiming Helena's remains for a Roman church do not survive. Where her relics may have gone can only be reconstructed from (much) later sources, which suggests that Helena's status as a saint in medieval Rome was humble at best, if she was venerated at all. The apparent disinterest in the whereabouts of Helena's Roman relics is telling, since relic mobility required a story proving provenance, authenticity, and purpose

in the new location, in order to ensure continued cultural significance.

66900 The fact that Helena's remains could be transported in and around Rome without an accompanying narrative tradition elucidating where they came from, where exactly they went, and why, suggests that her remains had little to no cultural significance as saintly relics at this time and place.

66905 The importance of narratives about the mobility and geographical anchoring of relics becomes especially evident when the Roman situation is compared with the vibrant Helena cult which first developed in ninth-century France. Its earliest witness is a *translatio* account, a hagiographical form which creates or reinvigorates a cult by foregrounding the transportation of relics from one place to another.

66910 In a hagiographical dossier on Helena, the Benedictine monk Altmann relates how her relics were stolen from Rome and taken to his abbey at Hautvillers in the diocese of Reims around 840 CE.

Whether the theft of Helena's remains from Rome and their transportation to the diocese of Reims actually happened is impossible to establish; it may not have. This is not out of character for Carolingian reports about relic theft, which often

66915 disguised relic purchase or could be entirely fabricated.

Following more general Carolingian practice, Altmann composed a hagiographical dossier about Helena – containing a *vita*, a *translatio*, and *miraculae* (in that order) – offering, as it were, all the ingredients for sainthood in one package.

66920 The *vita* records Helena's exemplary holy life and deeds, the *translatio* authenticates her relics and their presence at Hautvillers, and the miracles prove that Helena, i.e. her relics, performs as may be expected of a saint. In the *vita* and *translatio* in particular Altmann weaves together history and meaningful connection to place to provide a foundation for this new cult. Relic mobility plays a crucial role in tying together this argument: it serves to connect the remains of the historical empress

66925 who had been interred in Rome with the relics which arrived in the diocese of Reims in the ninth century.

Moreover, by inventing a new layer of 'history' – the suggestion that Helena had been born in Gallia Belgica – Altmann turns the relic transferral into a meaningful return to home ground; the crossing of the borders to her Gallic fatherland is a

66930 transformative moment in this narrative.

For his account of Helena's life, Altmann used historical texts well-known to his contemporaries, such as those by the ancient Church historians Paulus Orosius (c. 375/385–c. 420) and Rufinus of Aquileia (see above). For the *inventio crucis* he

66935 relied on Cassiodorus's *Historia Tripartita* (see above). While Altmann knew the Judas Cyriacus legend, Judas is not mentioned, probably because this would detract from Helena's lustre.

Rather than other saints' lives or legends, Altmann's main hagiographical example was the *Epitaphium Paulae* in which Jerome of Stridon (c. 347–420) commemorates his friend Paula, casting her as a model of matronly saintliness, including travel to the Holy

66940 Land.

Altmann thus underscores the historicity of Helena, a lady whose holy deeds were previously recorded by respected historians. However, these traditions had not – so far – given rise to veneration of Helena in the West. Altmann needed to offer something new, but equally authentic and trustworthy, to legitimize the cult that had

66945 newly sprung up at Hautvillers. He accomplished this by retelling Helena's story in the shape of a saint's *vita* and – crucially – by authenticating her relics and their presence at Hautvillers by means of the *translatio*: the story of how the relics moved there.

Proving that these relics were indeed authentic was essential, all the more because

66950 it seems that Helena's relics arrived at the abbey at a less than ideal moment. Altmann dates their arrival to 840, when – he says – the archiepiscopal seat of Reims was vacant (due to altercations related to Carolingian dynastic succession). This dating implicitly suggests two problems concerning Helena's relics. First, they could not be authenticated by a bishop directly upon arrival. Second, they were acquired by

66955 Halduin (not mentioned by Altmann), then abbot of Hautvillers. This abbot was deposed in 853 because of his ordination by Bishop Ebbo of Reims (epis. 817–835; 840–841), eventually disgraced for choosing the wrong side in dynastic conflicts. Altmann explicitly indicates that he wrote Helena's *vita* at the request of Hincmar (epis. 845–882), the next Archbishop of Reims. Hincmar probably also acted as superior of

66960 Hautvillers, since the abbey was apparently without abbot during this period. Combined with the inquiry into and authentication of Helena's relics at Reims (probably in 849), this suggests that the hagiographical dossier may have formed part of a concerted effort to straighten out the problematic start for Helena's relics in the diocese.

- 66965 The narrative about the transferral of the relics to Hautvillers played an essential role in solving these initial complications. Authentication was therefore at the forefront of Altmann's mind when he composed his dossier on Helena, sometime between 850 and 890 CE.
- 66970 Apart from cleverly valorizing her historicity, he also aimed to silence any doubts surrounding the provenance of her relics as well as to validate their rightful place at Hautvillers. This is where Helena's furtive translatio comes in. Starting with a chapter titled 'How the body of St Helena was taken to the Gallic fatherland (patria Gallie)', Altmann relates the story of Theogesius, a Remois priest who had wanted to go on pilgrimage to Rome for years, but could not on account of his bad health, until
- 66975 he sought the intercession of Helena. The moment he set out, he started feeling better, and he arrived in Rome cured. In the church where Helena was buried, Theogesius stayed on after vespers and stole her relics at night (with God's blessing, Altmann underlines), leaving for home the next morning.
- 66980 So far so good. However, when Theogesius came to 'the borders of our fatherland', things got sticky: 'useful doubts were born in the chests of many', who wanted to know how such a great saint could be transported by such a lowly priest. Altmann thus emphasizes that within the borders of the Gallic fatherland people entertain a healthy distrust of obscure wandering priests claiming to possess valuable relics.
- 66985 He then goes on to demonstrate that in Theogesius's case their misgivings eventually proved unfounded. Since doubts and altercations persisted, it was decided to hold an assembly in the cathedral of Reims, at which a map of Rome and histories were consulted. After much discussion the assembly unanimously concluded that Helena had indeed been buried in Rome.
- 66990 This still left open the question how such a great saint could ever reside at the insignificant monastery of Hautvillers, giving rise to continued unrest. The monks of Hautvillers then subjected themselves to much praying and fasting, before seeking the truth through a 'legal examination', which again turned out in their favour.
- 66995 To convince absolutely everyone, the (bishopless) cathedral of Reims, finally sent three Hautvillers monks to Rome to inquire; they came back with more assurances about the authenticity of Helena's relics and, as an additional bonus, relics of Polycarp, Sebastian, Urban, and Quirinus.
- 67000 With this Altmann considers the provenance of Helena's relics and their destination exhaustively validated and authenticated and concludes the translatio portion of the dossier.
- 67005 Highlighting the special connection between Helena and Gallia Belgica and suggesting that within this region her relics are more meaningful than elsewhere are the primary aims of the dossier. Therefore, geography and the crossing of geographical borders play an important role in the reasoning that Altmann uses to meaningfully connect these – potentially problematic – relics to the right saint, to their previous and new locations, and to the community that welcomes them. His suggestion that a map of Rome was consulted at the assembly at Reims cathedral is a case in point. Geography really begins to matter, however, the moment that Helena's relics cross the borders of the Gallic fatherland and their authenticity suddenly becomes an issue. He thus
- 67010 accentuates that inside this fatherland the potential significance of her relics was greater than outside of it. The suggestion of Helena's special connection with the Gallic fatherland does not come out of the blue. In the first line of the vita Altmann had already indicated that Helena was born in Trier; he is the first to ever suggest this. There he also points out that her residence in Trier was converted into a church dedicated to St Peter, belonging to the episcopal see: 'the first of Gallia Belgica'.
- 67015 Historians have sometimes puzzled over this suggestion, because Altmann's patron Hincmar (Archbishop of Reims) was embroiled in a conflict with Trier about which Belgic episcopal seat – Trier or Reims – should take precedence over the other.
- 67020 Altmann's remarks about Trier do make sense, however. First, Trier is a historically plausible birthplace for Helena (more so than Reims at least), since Trier had been the imperial capital of both her partner and son.
- 67025 Second, this also allowed Altmann to style the transferral of Helena's body to the patria Galliae as a meaningful return, back to her own fatherland.
- 67030 Finally, it offered a way of getting back at the see of Trier. Right at the start of the translatio Altmann explains that it had pleased the Lord to exalt the region of Belgica Secunda (including the diocese of Reims) with the precious relics of a body (Helena), which had been born in Belgica Prima (of which Trier was the capital).
- Note the jibe here: Helena was born at Trier in Belgica Prima but Belgica Secunda

(the diocese of Reims) received her relics, an even better price perhaps than episcopal precedence.

In Altmann's narrative Helena's relics accrete significance as they move: from relatively indifferent holy props in the adventures of Theogesius, to the initially contested, but eventually very valuable relics of a holy empress returning to her fatherland, offering divine compensation for the political injustice of the primacy of the see of Trier over Reims. Crossing the boundaries of the Gallic fatherland is a transformative moment in this process. In the authentication procedures that ensue, the authenticity of Helena's relics is put to the test by renewed mobility. Three respectable Hautvillers monks retrace humble Theogesius's steps to Rome and back, and since this imitative trip only produces more relics, more sanctity for their monastery, the prototype transferral (of Helena) is considered authentic. Seen from this perspective, Helena's translatio not only makes a double statement about the place of departure and of arrival – as has been cogently argued by M. Caroli about translatio accounts in general – but it also makes a statement about relic mobility: the crossing of geographical boundaries and (renewed) mobility create sanctity.

While Altmann's claims about Helena's translatio from Rome to Hautvillers and the connections which he elaborates between her and Gallia Belgica cannot stand the test of modern historical inquiry, his version of events did resonate with contemporaries. Acceptance of the narrative was undoubtedly helped by the fact that it fitted into an established literary tradition of Rome-to-Rhineland translations, originally started by Einhard's *Translatio SS. Marcellini et Petri*.

Altmann does not cite this archetypal translatio, nor does he say explicitly that Helena's relics came from the same cemetery. He does indicate that she was buried at inter duos lauros on the Via Labicana, citing the *Liber Pontificalis* (which does name Marcellinus and Petrus).

Whether or not Altmann was hoping to create associations with Einhard's well-known translatio remains unclear. The commonality was not missed by later medieval commentators, in any case.

Two contemporary texts that refer to Helena's translatio – anonymous *miraculae* (after 882) and the ecclesiastical history of Reims by the Frankish historian Flodoard of Reims (c. 893/894–966) – are primarily interested in the miracles performed by Helena's relics as they were on their way to Hautvillers (both based on Altmann's own *miraculae*).

Flodoard even rewrites Helena's translatio as an itinerary of successive miracles on the way from Rome to Hautvillers, suggesting that the idea of successful relic mobility (i.e. condoned by the saint herself) appealed to contemporary audiences. With his hagiographical dossier Altmann transformed Helena from a historical figure into a saint, by styling the translatio of her relics as a triumphant return 'home'. Despite Helena's long pre-existing role as auxiliary in the *inventio crucis* legend, she thus first became a saint in her own right through a story about the mobility and authenticity of her own relics, crucial for the new cult at Hautvillers, rather than a narrative about cross relics. The eventual success of Helena's cult – i.e. its gradual evolution from local, to Roman, to universal – would be ensured by an increasing variety of sacred objects associated with the empress's legendary travels. This growing assortment of holy things allegedly transported by Helena enhanced the appeal of her cult and allowed it to sail on the currents of not only the cult of corporeal relics, but also that of holy objects (construed more broadly), as discussed by Bianca Lopez in this volume.

Following a Carolingian start, the next phase in Helena's route to universal sainthood was characterized by portable holy things.

Helena as Mover of Relics

After starting as a local Hautvillers/Reims phenomenon centred on Helena's own relics, her cult eventually began to spread and to include new aspects: Helena as an imperial local native and founder, as well as a supplier of (Holy Land) relics. In what follows, I highlight the interplay between relics (both Helena and Holy Land relics) and hagiography (as well as reinventions of late antique local history) to demonstrate how her sainthood developed into a versatile paradigm of mobility, of herself and of holy objects.

Altmann briefly suggests that Helena sent various relics (including a Holy Land relic – Christ's last supper knife – but no cross relics) to Gallia, but seems uninterested in Helena as a supplier of relics.

Nevertheless this suggestion, and his suggestion of her Trier (or more broadly Western European) origin, set the tone for later medieval cult(s), which often tended

to claim Helena as an imperial connection in local/national narratives. This version of St Helena first developed in the Rhineland and was highly concerned with elaborating connections between local history and ecclesiastical and/or imperial Rome. Transregional mobility was crucial for the connections which these traditions sought to elaborate between Rome, Jerusalem, and their own locale. As a result, it will become possible to elucidate why she attracted veneration at these locations, and not in Rome, during the early and high Middle Ages.

The earliest documented signs of Helena veneration outside the Champagne region (home to Hautvillers and Reims) date to the late tenth century. In 952 a Helena relic was deposited, along with other relics, in the altar of a newly dedicated crypt at the abbey church of St Maximin in Trier.

In the same period, St Maximin's also began to claim that Helena had encouraged Constantine to found this abbey.

This claim and the inclusion of the relic point to awareness of Helena's supposed Trier origins, first introduced by Altmann more than a century before. Helena's Rhineland roots must have been widely accepted, since the tenth-century *Passio S. Gereonis* also proposes that Helena founded St Gereon's church in Cologne, which likewise points to a close association between herself and the region. In both cases, claiming foundation by Helena not only increased prestige, but could also offer political advantages, because of the privileges enjoyed by imperial foundations.

During the eleventh century more and clearer signs of a cult appeared, most importantly in the shape of a hagiographical text which elaborates additional links between Helena and Trier, and which also discusses relics she would have sent there.

The *Vita S. Helene et S. Agrici episcopi* (c. 1050-1072) caters to the interests of Trier cathedral, as well as those of the abbey of St Maximin.

The double vita first briefly describes Helena's life loosely based on Altmann's *vita Helene*, with as the main innovation the twist that Trier had reverted to paganism while she was away, first finding the cross in Jerusalem and later living in Rome. From there, she then lobbied for the reconversion of her home city with Pope Sylvester, resulting in the successful mission of Agricius, former patriarch of Antioch, to Trier.

The somewhat longer life of Agricius that follows then strives to elaborate close connections between Rome and Trier, emphasizing that the latter's church is an apostolic foundation, a second Rome, in order to promote Trier's independence and primacy as the first see of Gaul and Germany.

The double vita stresses the importance of relics Helena would have sent to her home city by giving them to Agricius to take with him on his mission. According to the vita she prepared a reliquary with relics she had collected in the Holy Land: the body of St Matthew the apostle, a crucifixion nail, and a knife from the last supper (first mentioned by Altmann, see above), plus unnamed 'relics of the Lord' (no explicit mention of cross relics). These relics play a key role in the (forged) 'Sylvester charter', quoted in this text, in which Pope Sylvester would have granted Trier primacy in Gallia and Germania.

According to the double vita this privilege was confirmed through the relics sent by Helena.

Helena thus not only initiated Agricius's reconversion mission as a caring imperial hailing from Trier, but she also supplied the tangible evidence of Trier's exceptional mandate as episcopal see in the shape of relics. It seems that the body of Matthew and a crucifixion nail could be worshipped in the city during the eleventh century; the abbey of St Maximin claimed to possess the knife from the last supper. The double vita (and in it Helena specifically) thus also allowed for authentication of Holy Land relics present in Trier; as a Holy Land pilgrim, she must have surely supplied the real thing.

Which appeared first in Trier, these relics or the (possibly orally transmitted) legend that Helena had supplied them, is a chicken-or-egg conundrum. It is clear, however, that the various roles attributed to Helena in the eleventh-century double vita – as an imperial, Christian founder of Trier, as supplier and authenticator of Holy Land relics – converge to further local interests in the shape of ecclesiastical power and assets, namely relics.

The role for Helena in the ecclesiastical history of Trier suggested by the *The Vita S. Helene et S. Agrici episcopi* provided a common thread for subsequent medieval traditions. For example, the slightly later city chronicle *Gesta Treverorum* (1101) lists additional relics sent to Trier by Helena in confirmation of the Sylvester charter: the body of Matthew, the Holy Robe, a tooth of St Peter, sandals of St Andrew, and the head of Pope Cornelius, also conveniently introducing relics preserved by Trier cathedral.

The Holy Robe, which was moved to the cathedral's main altar in 1196, has enjoyed a particularly long career as one of Trier's prize relics. It was first displayed for Emperor Maximilian I (and to eager crowds) during the imperial diet of 1512, and has attracted popular devotion at many subsequent showings, the last of which occurred in 2012.

Outside of Trier, in the wider Rhineland region, legendary associations between Helena and the Theban Legion – a Roman legion which converted to Christianity and was collectively martyred by the end of the third century CE – were important for her cult. From the tenth century onward, she was typically credited with founding churches to house the remains of sainted Theban soldiers, such as St Gereon's at Cologne (see above) and St Victor's at Xanten. Menager cogently analyses these traditions as offering counterweight to the (Helena-based) claims and ambitions of Trier, while displaying a comparable interest in the benefits of claiming imperial foundation and in *renovatio imperii* rhetoric.

With time, Cologne could also boast its own Helena-associated Holy Land relics. The remains of the three Magi were said to have been found and brought to Constantinople by herself, before they had resurfaced in Milan in 1158. The archbishop of Cologne, who accompanied Barbarossa on his campaign against Milan, acquired them there for his cathedral in 1164.

The above illustrates Helena's appeal as a legendary imperial founder of ecclesiastical establishments and bringer of arguably authentic Holy Land relics in the Rhineland. It does not necessarily point to her veneration as a saint. However, in addition to liturgical and hagiographical witnesses, the presence of numerous Helena relics in the area clearly indicates a vibrant cult.

The abbey of St Maximin in Trier possessed a relic already in 952 (see above). During the eleventh century Helena relics started appearing across the Rhineland and beyond.

Relics were recorded at Echternach (Luxemburg) in 1039, at Gorze near Metz in 1068 and 1077, at Trier-Euren in 1075, at Bonn in 1135, at Cologne in 1135 and 1219, at Xanten in 1220.

In the category of slightly larger relics, the provost of St Gereon in Cologne acquired an arm-relic of Helena in 1220, the archbishop of Trier received a head-relic from Emperor Charles IV for which the bishop had a reliquary bust made in 1380, and a hand-relic is mentioned in the records of St Victor's at Xanten in 1507.

Contact relics (sanctified by proximity to Helena's person) were also recorded. A monstrelance said to incorporate the corona sanctae Helenae was first carried in a procession at St Gereon's in Cologne in 1266.

Various Helena-related objects were reported at Trier cathedral at several points during the later Middle Ages, such as another crown, an ancient drinking bowl, a comb, and a brooch.

From the long eleventh century onward, Helena became widely venerated as a saint in the Rhineland, while at the same time becoming a key character in local ecclesiastical histories, as an imperial local native, founder of churches, and bringer of relics. This version of Helena, both in her saintly and her imperial capacity, continued to shape local historiography and devotion. The *Medulla Gestorum Treveren* (1514) by auxiliary bishop and university rector Johan Enen (c. 1480–1519), for example, emphasizes the apostolic and imperial roots of ecclesiastical Trier according to the same paradigm first presented by the eleventh-century double vita of Helena and Agricius. This sixteenth-century description of the religious foundations and sacred objects in Trier reserves a large role for Helena in the history of this 'holy city'.

Her impact on the present is also discussed, in the shape of important relics preserved at Trier cathedral.

Enen first stresses that this cathedral was converted from Helena's palace, and then discusses her head-relic as one of the prize *heiltumb* of this establishment, others of which included several relics she had supplied: the body of St Matthew, a crucifixion nail, the head of Pope Cornelius, and above all the Holy Robe.

Late Medieval Developments and Concluding Remarks

It has been my object to demonstrate that Helena's medieval sainthood was not made by the *inventio crucis* legend (although it provided an important narrative foundation), but by narratives about relic mobility and the potential of her legendary personage for elaborating physical connections (in the shape of relics) with the major religious centres elsewhere, most importantly Rome and Jerusalem. Altmann of Hautvillers first created her as a saint in the ninth century by telling the story of

the translatio of her relics from Rome to the diocese of Reims. His innovative claim that Helena had been born in Gallia gave meaning to this furtive relic relocation: the empress was returning home to honour her home region. During the long eleventh century, meaningful relic transfer became even more important for Helena's cult as it spread in the Rhineland, and she received an additional role as supplier of Holy Land relics, which in turn also confirmed connections with ecclesiastical and imperial Rome.

The relic-obsessed Rhineland paradigm for Helena's sainthood, fundamentally characterized by relic mobility and interested in imperial allure, would go on to shape several subsequent variants of Helena's legend and cult. During the later Middle Ages it also co-existed – and sometimes competed with – variant traditions. Cults in France remained more Hautvillers-oriented: the cathedral at Orleans received Helena relics from the abbey in the thirteenth century, and Helena's head was venerated at the town of Montier-en-Der (rivalling Trier's head-relic). During the thirteenth century a new cult developed in Venice; in 1212 Helena's body was said to have been moved there from Constantinople, a translatio first recorded in the chronicle by Doge Andrea Dandolo (1343-1354).

The Rhineland paradigm was paralleled by a largely secular British Helena tradition which took its cue from Altmann's keenness to 'press the local connection'. Henry of Huntington's *Historia Anglorum* (1123-1154) first presents Helena as a British princess, the daughter of King Cole of Colchester, to establish Constantine's British princeliness in his discussion on the development of the British monarchy; the *inventio crucis* is not mentioned. Geoffrey of Monmouth popularized this story in his *Historia regum Britannie* (c. 1136-1138), portraying Helena as the excellent progenitrix of English monarchs, including King Arthur. Geoffrey too is unconcerned with Helena's saintly deeds.

Later chronicle traditions did add religious overtones by referring to the *inventio crucis*, and the British Helena first entered hagiography with the *Vita sancta Helene* (c. 1198-1207) by Jocelin of Furness, but on the whole Helena does not appear to have been a popular saint in Britain.

Helena again appeared in British hagiography three centuries later in the *Nova Legenda Anglie* (1516), an early sixteenth-century revision of a pre-existing collection of English saints.

Helena also features in post-Reformation English Catholic hagiographical collections, such as the Stowe 53 and Folger V.b. 334 manuscripts discussed by Jenny Bledsoe elsewhere in this volume, which illustrates the adaptability of her story. However, the British Helena Legend predominantly thrived in secular contexts with nationalist agendas, which were served by proving Constantine's British birth, from around 1500 CE onward, until Edward Gibbon dispelled the myth in the late eighteenth century. That the British Helena mostly remained the stuff of historiographical rather than hagiographical legend is corroborated by the striking insular disinterest in Helena (or Helena-associated) relics.

Despite important differences, the Rhineland cult and the British tradition have one thing in common: they value Helena for the potential of her legendary character to create links with Rome, imperial and/or ecclesiastical. This commonality helps explain why in twelfth-century Rome, it was all right to reuse Helena's sarcophagus for the burial of a pope and disperse her remains to (initially) unknown locations, while this would have been unthinkable in the Rhineland or Britain during the same period. Rome already was Rome, the former imperial capital, with plenty of obvious claims to being the centre of Christian empire. The papacy could invoke the *donatio Constantini*; there was no need to stake any claims based on Helena's legendary character.

It seems that this had not changed by the 1260s, if we refer to the Golden Legend as a touchstone of widely accepted traditions about Helena's legendary deeds on the Italian peninsula. Jacopo da Varazze briefly observes that Helena may have been born in either Britain or Trier, but does not seem to care which is true.

He also does not reflect on where her relics might be, and does not connect her with Rome, except by observing that she had one crucifixion nail incorporated into a statue of Constantine in Rome.

In the legend on the birth of Christ it is suggested as an aside that Helena brought nativity hay to Rome, but that is where her links with Rome end.

Helena thus appears in the role of supplier of Holy Land relics, but there are no indications that Rome claimed to be a prime destination of such relics at this point in time.

This would change over the next few centuries. Several allegedly Helena-supplied Holy Land relics can be venerated in Rome still today: cross relics, the *titulus crucis*,

- 67295 earth from the Holy Land, the scala sancta, etc. The Rhineland paradigm for Helena's sainthood clearly caught on in Rome. These Roman traditions claim to be ancient, yet they are surprisingly late, as are traditions about Helena's own relics within Rome. Only from the late fifteenth century onward did Holy Land relics supposedly brought by Helena and relics of herself start to be a factor of note in the sacred cityscape
- 67300 of the eternal city and only in the course of the seventeenth century did her cult become fully established. Eventually it was this Roman Helena legend that would go on to become so ubiquitous that the impression that Helena had always been a saint in Rome and in Catholicism has become difficult to avoid. In reality, her sainthood was made by medieval
- 67305 narratives about sacred mobility, which clearly enjoyed renewed/continued cultural relevance in Renaissance Rome. Helena's long trajectory to universal sainthood exemplifies several larger trends in the cult of the saints as it evolved within the contexts of both medieval and post-Tridentine Catholicism. It is, for example, illustrative of the general (although
- 67310 never altogether hegemonic) shift from the early medieval abundance of geographically localized cults to the handful of universal star-saints which dominated early modernity. Moreover, it participates in the broader medieval preoccupation with holy objects (including relics) which are at once similar and dissimilar to the heavenly (Christ)
- 67315 and earthly (Holy Land) originals which they represent. The growing number of such nuggets of portable sanctity associated with Helena's cult eventually ensured its success. The aim of this essay has been to bring into focus the highly dynamic and multifaceted processes of medieval hagiographic construction and to make a case for studying medieval sainthood as a dynamic conversation between
- 67320 various texts and objects in perpetual geographic transition. As a result, it has become clear that hagiographical narratives about relic mobility were not just a Carolingian or a high medieval phenomenon, but remained important well into the late medieval and early modern period.

67445 Eusebius, The Life of Constantine: Helenopolis/Drepana
 CHAPTER LXI: His Sickness at Helenopolis, and Prayers respecting his Baptism.
 AT first he experienced some slight bodily indisposition, which was soon followed by
 67450 positive disease. In consequence of this he visited the hot baths of his own city;
 and thence proceeded to that which bore the name of his mother. Here he passed some
 time in the church of the martyrs, and offered up supplications and prayers to God.
 Being at length convinced that his life was drawing to a close, he felt the time was
 come at which he should seek purification from sins of his past career, firmly
 67455 believing that whatever errors he had committed as a mortal man, his soul would be
 purified from them through the efficacy of the mystical words and the salutary waters
 of baptism. Impressed with these thoughts, he poured forth his supplications and
 confessions to God, kneeling on the pavement in the church itself, in which he also
 now for the first time received the imposition of hands with prayer. After this he
 proceeded as far as the suburbs of Nicomedia, and there, having summoned the bishops
 to meet him, addressed them in the following words.

67460 "THE time is arrived which I have long hoped for, with an earnest desire and prayer
 that I might obtain the salvation of God. The hour is come in which I too may have
 the blessing of that seal which confers immortality; the hour in which I may receive
 the seal of salvation. I had thought to do this in the waters of the river Jordan,
 67465 wherein our Saviour, for our example, is recorded to have been baptized: but God, who
 knows what is expedient for us, is pleased that I should receive this blessing here.
 Be it so, then, without delay: for should it be his will who is Lord of life and
 death, that my existence here should be prolonged, and should I be destined
 henceforth to associate with the people of God, and unite with them in prayer as a
 67470 member of his. Church, I will prescribe to myself from this time such a course of
 life as befits his service."

Eusebius, The Life of Constantine: Aphaca
 CHAPTER LV: Overthrow of an Idol Temple, and Abolition of Licentious Practices, at
 67475 Aphaca in Phoenicia.
 THE emperor's next care was to kindle, as it were, a brilliant torch, by the light of
 which he directed his imperial gaze around, to see if any hidden vestiges of error
 might still exist. And as the keen-sighted eagle in its heavenward flight is able to
 descry from its lofty height the most distant objects on the earth, so did he, while
 67480 residing in the imperial palace of his own fair city, discover as from a watch-tower
 a hidden and fatal snare of souls in the province of Phoenicia. This was a grove and
 temple, not situated in the midst of any city, nor in any public place, as for
 splendor of effect is generally the case, but apart from the beaten and frequented
 road, at Aphaca, on part of the summit of Mount Lebanon, and dedicated to the foul
 67485 demon known by the name of Venus. It was a school of wickedness for all the votaries
 of impurity, and such as destroyed their bodies with effeminacy. Here men undeserving
 of the name forgot the dignity of their sex, and propitiated the demon by their
 effeminate conduct; here too unlawful commerce of women and adulterous intercourse,
 with other horrible and infamous practices, were perpetrated in this temple as in a
 67490 place beyond the scope and restraint of law. Meantime these evils remained unchecked
 by the presence of any observer, since no one of fair character ventured to visit
 such scenes. These proceedings, however, could not escape the vigilance of our august
 emperor, who, having himself inspected them with characteristic forethought, and
 judging that such a temple was unfit for the light of heaven, gave orders that the
 67495 building with its offerings should be utterly destroyed. Accordingly, in obedience to
 the imperial command, these engines of an impure superstition were immediately
 abolished, and the hand of military force was made instrumental in purging the place.
 And now those who had heretofore lived without restraint learned self-control through
 the emperor's threat of punishment, as likewise those superstitious Gentiles wise in
 67500 their own conceit, who now obtained experimental proof of their own folly.

Eusebius, The Life of Constantine: Heliopolis
 CHAPTER LVIII: How he destroyed the Temple of Venus at Heliopolis, and built the
 First Church in that City.
 SUCH actions as I have described may well be reckoned among the emperor's noblest
 67505 achievements, as also the wise arrangements which he made respecting each particular
 province. We may instance the Phoenician city Heliopolis, in which those who dignify
 licentious pleasure with a distinguishing title of honor, had permitted their wives
 and daughters to commit shameless fornication. But now a new statute, breathing the
 very spirit of modesty, proceeded from the emperor, which peremptorily forbade the
 67510 continuance of former practices. And besides this he sent them also written

exhortations, as though he had been especially ordained by God for this end, that he might instruct all men in the principles of chastity. Hence, he disdained not to communicate by letter even with these persons, urging them to seek diligently the knowledge of God. At the same time he followed up his words by corresponding deeds, and erected even in this city a church of great size and magnificence: so that an event unheard of before in any age, now for the first time came to pass, namely, that a city which had hitherto been wholly given up to superstition now obtained the privilege of a church of God, with presbyters and deacons, and its people were placed under the presiding care of a bishop consecrated to the service of the supreme God. And further, the emperor, being anxious that here also as many as possible might be won to the truth, bestowed abundant provision for the necessities of the poor, desiring even thus to invite them to seek the doctrines of salvation, as though he were almost adopting the words of him who said, "Whether in pretense, or in truth, let Christ be preached."

Eusebius, The Life of Constantine: Aegae

CHAPTER LVI: Destruction of the Temple of Aesculapius at Aegae.

FOR since a wide-spread error of these pretenders to wisdom concerned the demon worshiped in Cilicia, whom thousands regarded with reverence as the possessor of saving and healing power, who sometimes appeared to those who passed the night in his temple, sometimes restored the diseased to health, though on the contrary he was a destroyer of souls, who drew his easily deluded worshipers from the true Saviour to involve them in impious error, the emperor, consistently with his practice, and desire to advance the worship of him who is at once a jealous God and the true Saviour, gave directions that this temple also should be razed to the ground. In prompt obedience to this command, a band of soldiers laid this building, the admiration of noble philosophers, prostrate in the dust, together with its unseen inmate, neither demon nor god, but rather a deceiver of souls, who had seduced mankind for so long a time through various ages. And thus he who had promised to others deliverance from misfortune and distress, could find no means for his own security, any more than when, as is told in myth, he was scorched by the lightning's stroke. Our emperor's pious deeds, however, had in them nothing fabulous or feigned; but by virtue of the manifested power of his Saviour, this temple as well as others was so utterly overthrown, that not a vestige of the former follies was left behind.

Eusebius, The Life of Constantine: Bethlehem

CHAPTER XLI: Of the Erection of Churches in Bethlehem, and on the Mount of Olives. IN the same country he discovered other places, venerable as being the localities of two sacred caves: and these also he adorned with lavish magnificence. In the one case, he rendered due honor to that which had been the scene of the first manifestation of our Saviour's divine presence, when he submitted to be born in mortal flesh; while in the case of the second cavern he hallowed the remembrance of his ascension to heaven from the mountain top. And while he thus nobly testified his reverence for these places, he at the same time eternized the memory of his mother, who had been the instrument of conferring so valuable a benefit on mankind.

CHAPTER XLII: That the Empress Helena, Constantine's Mother, having visited this Locality for Devotional Purposes, built these Churches.

FOR she, having resolved to discharge the duties of pious devotion to the God, the King of kings, and feeling it incumbent on her to render thanksgivings with prayers on behalf both of her own son, now so mighty an emperor, and of his sons, her own grandchildren, the divinely favored Caesars, though now advanced in years, yet gifted with no common degree of wisdom, had hastened with youthful alacrity to survey this venerable land; and at the same time to visit the eastern provinces, cities, and people, with a truly imperial solicitude. As soon, then, as she had rendered due reverence to the ground which the Saviour's feet had trodden, according to the prophetic word which says "Let us worship at the place whereon his feet have stood," she immediately bequeathed the fruit of her piety to future generations.

CHAPTER XLIII: A Farther Notice of the Churches at Bethlehem.

FOR without delay she dedicated two churches to the God whom she adored, one at the grotto which had been the scene of the Saviour's birth; the other on the mount of his ascension. For he who was "God with us" had submitted to be born even in a cave of the earth, and the place of his nativity was called Bethlehem by the Hebrews.

Accordingly the pious empress honored with rare memorials the scene of her travail who bore this heavenly child, and beautified the sacred cave with all possible

splendor. The emperor himself soon after testified his reverence for the spot by princely offerings, and added to his mother's magnificence by costly presents of silver and gold, and embroidered hangings. And farther, the mother of the emperor raised a stately structure on the Mount of Olives also, in memory of his ascent to heaven who is the Saviour of mankind, erecting a sacred church and temple on the very summit of the mount.

And indeed authentic history informs us that in this very cave the Saviour imparted his secret revelations to his disciples. And here also the emperor testified his reverence for the King of kings, by diverse and costly offerings. Thus did Helena Augusta, the pious mother of a pious emperor, erect over the two mystic caverns these two noble and beautiful monuments of devotion, worthy of everlasting remembrance, to the honor of God her Saviour, and as proofs of her holy zeal, receiving from her son the aid of his imperial power. Nor was it long ere this aged woman reaped the due reward of her labors. After passing the whole period of her life, even to declining age, in the greatest prosperity, and exhibiting both in word and deed abundant fruits of obedience to the divine precepts, and having enjoyed in consequence an easy and tranquil existence, with unimpaired powers of body and mind, at length she obtained from God an end befitting her pious course, and a recompense of her good deeds even in this present life.

Basilica

Above a cave in Bethlehem, Constantine built an octogon with a basilica and a court enclosed by four porticoes in the front. During the Samaritan revolt of 529 C.E. the building was destroyed. Justinian rebuilt it in its actual shape, which was preserved by the Persian invaders (612). In the crypts the traditional Nativity cave is connected with other caves where the monastic sojourn of Jerome and his community is commemorated (Vincent and Abel 1914; M. Avi-Yonah, *The Madaba Mosaic Map with Introduction and Commentary*, Jerusalem 1954, *Encyclopedia of Archaeological Excavations in the Holy Land*, 4 vols., ed. M. Avi-Yonah, 1975 1:202-6; Heitz 1983:6-18; Murphy-O'Connor 1983:12-13).

Eusebius, *The Life of Constantine: Nicomedia*

CHAPTER L: That he erected Churches in Nicomedia, and in Other Cities.

HAVING thus embellished the city which bore his name, he next distinguished the capital of Bithynia by the erection of a stately and magnificent church, being desirous of raising in this city also, in honor of his Saviour and at his own charges, a memorial of his victory over his own enemies and the adversaries of God. He also decorated the principal cities of the other provinces with sacred edifices of great beauty; as, for example, in the case of that metropolis of the East which derived its name from Antiochus, in which, as the head of that portion of the empire, he consecrated to the service of God a church of unparalleled size and beauty. The entire building was encompassed by an enclosure of great extent, within which the church itself rose to a vast elevation, being of an octagonal form, and surrounded on all sides by many chambers, courts, and upper and lower apartments; the whole richly adorned with a profusion of gold, brass, and other materials of the most costly kind.

CHAPTER LXVI: Removal of the Body from Nicomedia to the Palace at Constantinople.

AFTER this the soldiers lifted the body from its couch, and laid it in a golden coffin, which they enveloped in a covering of purple, and removed to the city which was called by his own name. Here it was placed in an elevated position in the principal chamber of the imperial palace, and surrounded by candles burning in candlesticks of gold, presenting a marvelous spectacle, and such as no one under the light of the sun had ever seen on earth since the world itself began. For in the central apartment of the imperial palace, the body of the emperor lay in its elevated resting-place, arrayed in the symbols of sovereignty, the diadem and purple robe, and encircled by a numerous retinue of attendants, who watched around it incessantly night and day.

Eusebius, *The Life of Constantine: Jerusalem*

CHAPTER XXVIII: Discovery of the Most Holy Sepulchre.

THIS also was accomplished without delay. But as soon as the original surface of the ground, beneath the covering of earth, appeared, immediately, and contrary to all expectation, the venerable and hollowed monument of our Saviour's resurrection was discovered. Then indeed did this most holy cave present a faithful similitude of his return to life, in that, after lying buried in darkness, it again emerged to light, and afforded to all who came to witness the sight, a clear and visible proof of the wonders of which that spot had once been the scene, a testimony to the resurrection

of the Saviour clearer than any voice could give.

67645 CHAPTER XXIX: How he wrote concerning the Erection of a Church, both to the Governors of the Provinces, and to the Bishop Macarius.

67650 IMMEDIATELY after the transactions I have recorded, the emperor sent forth injunctions which breathed a truly pious spirit, at the same time granting ample supplies of money, and commanding that a house of prayer worthy of the worship of God should be erected near the Saviour's tomb on a scale of rich and royal greatness. This object he had indeed for some time kept in view, and had foreseen, as if by the aid of a superior intelligence, that which should afterwards come to pass. He laid his commands, therefore, on the governors of the Eastern provinces, that by an abundant and unsparing expenditure they should secure the completion of the work on a scale of noble and ample magnificence. He also dispatched the following letter to the bishop who at that time presided over the church at Jerusalem, in which he clearly asserted the saving doctrine of the faith, writing in these terms.

67660 CHAPTER XXX: Constantine's Letter to Macarius respecting the Building of the Church of our Saviour.

"VICTOR CONSTANTIUS, MAXIMUS AUGUSTUS, to Macarius.

67665 "Such is our Saviour's grace, that no power of language seems adequate to describe the wondrous circumstance to which I am about to refer. For, that the monument of his most holy Passion, so long ago buried beneath the ground, should have remained unknown for so long a series of years, until its reappearance to his servants now set free through the removal of him who was the common enemy of all, is a fact which truly surpasses all admiration. For if all who are accounted wise throughout the world were to unite in their endeavors to say somewhat worthy of this event, they would be unable to attain their object in the smallest degree. Indeed, the nature of this miracle as far transcends the capacity of human reason as heavenly things are superior to human affairs. For this cause it is ever my first, and indeed my only object, that, as the authority of the truth is evincing itself daily by fresh wonders, so our souls may all become more zealous, with all sobriety and earnest unanimity, for the honor of the Divine law. I desire, therefore, especially, that you should be persuaded of that which I suppose is evident to all beside, namely, that I have no greater care than how I may best adorn with a splendid structure that sacred spot, which, under Divine direction, I have disencumbered as it were of the heavy weight of foul idol worship; a spot which has been accounted holy from the beginning in God's judgment, but which now appears holier still, since it has brought to light a clear assurance of our Saviour's passion.

67685 CHAPTER XXXI: That the Building should surpass all the Churches in the World in the Beauty of its Walls, its Columns, and Marbles.

67690 "IT will be well, therefore, for your sagacity to make such arrangements and provision of all things needful for the work, that not only the church itself as a whole may surpass all others whatsoever in beauty, but that the details of the building may be of such a kind that the fairest structures in any city of the empire may be excelled by this. And with respect to the erection and decoration of the walls, this is to inform you that our friend Dracilianus, the deputy of the Praetorian Praefects, and the governor of the province, have received a charge from us. For our pious directions to them are to the effect that artificers and laborers, and whatever they shall understand from your sagacity to be needful for the advancement of the work, shall forthwith be furnished by their care. And as to the columns and marbles, whatever you shall judge, after actual inspection of the plan, to be especially precious and serviceable, be diligent to send information to us in writing, in order that whatever quantity or sort of materials we shall esteem from your letter to be needful, may be procured from every quarter, as required, for it is fitting that the most marvelous place in the world should be worthily decorated.

67700 CHAPTER XXXII: That he instructed the Governors concerning the Beautifying of the Roof; also concerning Workmen, and Materials.

67705 "WITH respect to the ceiling of the church, I wish to know from you whether in your judgment it should be panel-ceiled, or finished with any other kind of workmanship. If the panel ceiling be adopted, it may also be ornamented with gold. For the rest, your Holiness will give information as early as possible to the before-mentioned magistrates how many laborers and artificers, and what expenditure of money is required. You will also be careful to send us a report without delay, not only respecting the marbles and columns, but the paneled ceiling also, should this appear

to you to be the most beautiful form. God preserve you, beloved brother!"

CHAPTER XXXIIII: How the Church of our Saviour, the New Jerusalem prophesied of in Scripture, was built.

THIS was the emperor's letter; and his directions were at once carried into effect. Accordingly, on the very spot which witnessed the Saviour's sufferings, a new Jerusalem was constructed, over against the one so celebrated of old, which, since the foul stain of guilt brought on it by the murder of the Lord, had experienced the last extremity of desolation, the effect of Divine judgment on its impious people. It was opposite this city that the emperor now began to rear a monument to the Saviour's victory over death, with rich and lavish magnificence. And it may be that this was that second and new Jerusalem spoken of in the predictions of the prophets, concerning which such abundant testimony is given in the divinely inspired records. First of all, then, he adorned the sacred cave itself, as the chief part of the whole work, and the hallowed monument at which the angel radiant with light had once declared to all that regeneration which was first manifested in the Saviour's person.

CHAPTER XXXIV: Description of the Structure of the Holy Sepulchre.

THIS monument, therefore, first of all, as the chief part of the whole, the emperor's zealous magnificence beautified with rare columns, anti profusely enriched with the most splendid decorations of every kind.

CHAPTER XXXV: Description of the Atrium and Porticoes.

THE next object of his attention was a space of ground of great extent, and open to the pure air of heaven. This he adorned with a pavement of finely polished stone, and enclosed it on three sides with porticoes of great length.

CHAPTER XXXVI: Description of the Walls, Roof, Decoration, and Gilding of the Body of the Church.

FOR at the side opposite to the cave, which was the eastern side, the church itself was erected; a noble work rising to a vast height, and of great extent both in length and breadth. The interior of this structure was floored with marble slabs of various colors; while the external surface of the walls, which shone with polished stones exactly fitted together, exhibited a degree of splendor in no respect inferior to that of marble. With regard to the roof, it was covered on the outside with lead, as a protection against the rains of winter. But the inner part of the roof, which was finished with sculptured panel work, extended in a series of connected compartments, like a vast sea, over the whole church; and, being overlaid throughout with the purest gold, caused the entire building to glitter as it were with rays of light.

CHAPTER XXXVII: Description of the Double Porticoes on Either Side, and of the Three Eastern Gates.

BESIDES this were two porticoes on each side, with upper and lower ranges of pillars, corresponding in length with the church itself; and these also had their roofs ornamented with gold. Of these porticoes, those which were exterior to the church were supported by columns of great size, while those within these rested on piles of stone beautifully adorned on the surface. Three gates, placed exactly east, were intended to receive the multitudes who entered the church.

CHAPTER XXXVIII: Description of the Hemisphere, the Twelve Columns, and their Bowls.

OPPOSITE these gates the crowning part of the whole was the hemisphere, which rose to the very summit of the church. This was encircled by twelve columns (according to the number of the apostles of our Saviour), having their capitals embellished with silver bowls of great size, which the emperor himself presented as a splendid offering to his God.

CHAPTER XXXIX: Description of the Inner Court, the Arcades and Porches.

IN the next place he enclosed the atrium which occupied the space leading to the entrances in front of the church. This comprehended, first the court, then the porticoes on each side, and lastly the gates of the court. After these, in the midst of the open market-place, the general entrance-gates, which were of exquisite workmanship, afforded to passers-by on the outside a view of the interior which could not fail to inspire astonishment.

CHAPTER XL: Of the Number of his Offerings.

THIS temple, then, the emperor erected as a conspicuous monument of the Saviour's

67775 resurrection, and embellished it throughout on an imperial scale of magnificence. He
 further enriched it with numberless offerings of inexpressible beauty and various
 materials, - gold, silver, and precious stones, the skillful and elaborate
 arrangement of which, in regard to their magnitude, number, and variety, we have not
 67780 leisure at present to describe particularly.

CHAPTER XXV: How he ordered the Erection of a Church at Jerusalem, in the Holy Place
 of our Saviour's Resurrection.
 AFTER these things, the pious emperor addressed himself to another work truly worthy
 of record, in the province of Palestine. What then was this work? He judged it
 67785 incumbent on him to render the blessed locality of our Saviour's resurrection an
 object of attraction and veneration to all. He issued immediate injunctions,
 therefore, for the erection in that spot of a house of prayer: and this he did, not
 on the mere natural impulse of his own mind, but being moved in spirit by the Saviour
 himself.

67790 CHAPTER XXVI: That the Holy Sepulchre had been covered with Rubbish and with Idols by
 the Ungodly.

FOR it had been in time past the endeavor of impious men (or rather let me say of the
 whole race of evil spirits through their means), to consign to the darkness of
 67795 oblivion that divine monument of immortality to which the radiant angel had descended
 from heaven, and rolled away the stone for those who still had stony hearts, and who
 supposed that the living One still lay among the dead; and had declared glad tidings
 to the women also, and removed their stony-hearted unbelief by the conviction that he
 whom they sought was alive. This sacred cave, then, certain impious and godless
 67800 persons had thought to remove entirely from the eyes of men, supposing in their folly
 that thus they should be able effectually to obscure the truth. Accordingly they
 brought a quantity of earth from a distance with much labor, and covered the entire
 spot; then, having raised this to a moderate height, they paved it with stone,
 concealing the holy cave beneath this massive mound. Then, as though their purpose
 67805 had been effectually accomplished, they prepare on this foundation a truly dreadful
 sepulchre of souls, by building a gloomy shrine of lifeless idols to the impure
 spirit whom they call Venus, and offering detestable oblations therein on profane and
 accursed altars. For they supposed that their object could not otherwise be fully
 attained, than by thus burying the sacred cave beneath these foul pollutions. Unhappy
 67810 men! they were unable to comprehend how impossible it was that their attempt should
 remain unknown to him who had been crowned with victory over death, any more than the
 blazing sun, when he rises above the earth, and holds his wonted course through the
 midst of heaven, is unseen by the whole race of mankind. Indeed, his saving power,
 shining with still greater brightness, and illumining, not the bodies, but the souls
 67815 of men, was already filling the world with the effulgence of its own light.
 Nevertheless, these devices of impious and wicked men against the truth had prevailed
 for a long time, nor had any one of the governors, or military commanders, or even of
 the emperors themselves ever yet appeared, with ability to abolish these daring
 impieties, save only that one who enjoyed the favor of the King of kings. And now,
 67820 acting as he did under the guidance of the divine Spirit, he could not consent to see
 the sacred spot of which we have spoken, thus buried, through the devices of the
 adversaries, under every kind of impurity, and abandoned to forgetfulness and
 neglect; nor would he yield to the malice of those who had contracted this guilt, but
 calling on the divine aid, gave orders that the place should be thoroughly purified,
 67825 thinking that the parts which had been most polluted by the enemy ought to receive
 special tokens, through his means, of the greatness of the divine favor. As soon,
 then, as his commands were issued, these engines of deceit were cast down from their
 proud eminence to the very ground, and the dwelling-places of error, with the statues
 and the evil spirits which they represented, were overthrown and utterly destroyed.

67830 CHAPTER XXVII: How Constantine commanded the Materials of the Idol Temple, and the
 Soil itself, to be removed at a Distance.

NOR did the emperor's zeal stop here; but he gave further orders that the materials
 of what was thus destroyed, both stone and timber, should be removed and thrown as
 67835 far from the spot as possible; and this command also was speedily executed. The
 emperor, however, was not satisfied with having proceeded thus far: once more, fired
 with holy ardor, he directed that the ground itself should be dug up to a
 considerable depth, and the soil which had been polluted by the foul impurities of
 demon worship transported to a far distant place.

67840 Eusebius, The Life of Constantine: Mambre

CHAPTER LI: That he ordered a Church to be built at Mambre.

SUCH was the principal sacred edifices erected by the emperor's command. But having heard that the self-same Saviour who ere while had appeared on earth had in ages long since past afforded a manifestation of his Divine presence to holy men of Palestine near the oak of Mambre, he ordered that a house of prayer should be built there also in honor of the God who had thus appeared. Accordingly the imperial commission was transmitted to the provincial governors by letters addressed to them individually, enjoining a speedy completion of the appointed work. He sent moreover to the writer of this history an eloquent admonition, a copy of which I think it well to insert in the present work, in order to convey a just idea of his pious diligence and zeal. To express, then, his displeasure at the evil practices which he had heard were usual in the place just referred to, he addressed me in the following terms.

CHAPTER LII: Constantine's Letter to Eusebius concerning Mambre.

"VICTOR CONSTANTINUS, MAXIMUS AUGUSTUS, to Macarius, and the rest of the bishops in Palestine.

"One benefit, and that of no ordinary importance, has been conferred on us by my truly pious mother-in-law, in that she has made known to us by letter that abandoned folly of impious men which has hitherto escaped detection by you: so that the criminal conduct thus overlooked may now through our means obtain fitting correction and remedy, necessary though tardy. For surely it is a grave impiety indeed, that holy places should be defiled by the stain of unhallowed impurities. What then is this, dearest brethren, which, though it has eluded your sagacity, she of whom I speak was impelled by a pious sense of duty to disclose?

CHAPTER LIII: That the Saviour appeared in this Place to Abraham.

"SHE assures me, then, that the place which takes its name from the oak of Mambre, where we find that Abraham dwelt, is defiled by certain of the slaves of superstition in every possible way. She declares that idols which should be utterly destroyed have been erected on the site of that tree; that an altar is near the spot; and that impure sacrifices are continually performed. Now since it is evident that these practices are equally inconsistent with the character of our times, and unworthy the sanctity of the place itself, I wish your Gravities to be informed that the illustrious Count Acacius, our friend, has received instructions by letter from me, to the effect that every idol which shall be found in the place above-mentioned shall immediately be consigned to the flames; that the altar be utterly demolished; and that if any one, after this our mandate, shall be guilty of impiety of any kind in this place, he shall be visited with condign punishment. The place itself we have directed to be adorned with an unpolluted structure, I mean a church; in order that it may become a fitting place of assembly for holy men. Meantime, should any breach of these our commands occur, it should be made known to our clemency without the least delay by letters from you, that we may direct the person detected to be dealt with, as a transgressor of the law, in the severest manner. For you are not ignorant that the Supreme God first appeared to Abraham, and conversed with him, in that place. There it was that the observance of the Divine law first began; there first the Saviour himself, with the two angels, vouchsafed to Abraham a manifestation of his presence; there God first appeared to men; there he gave promise to Abraham concerning his future seed, and straightway fulfilled that promise; there he foretold that he should be the father of a multitude of nations. For these reasons, it seems to me right that this place should not only be kept pure through your diligence from all defilement, but restored also to its pristine sanctity; that nothing hereafter may be done there except the performance of fitting service to him who is the Almighty God, and our Saviour, and Lord of all. And this service it is incumbent on you to care for with due attention, if your Gravities be willing (and of this I feel confident) to gratify my wishes, which are especially interested in the worship of God. May he preserve you, beloved brethren!"

Arbo, also Terebinth. The Oak of Mambre - (Ramat al-Khalil)

The site of Mamre, known in Arabic as Haram Ramet el-Khalil, lies approximately 3 km north of Hebron on the ancient road linking the main Hebron-Jerusalem and Bethlehem-Ziph routes. The Bible describes Elonei (oaks of) Mamre as Abraham's dwelling place, where he built an altar to God (Gen. 13:18, 18:1, 23:19). Some scholars locate the biblical Elonei Mamre within the town of ancient Hebron (Tell Rumeideh); others identify it with the enclosure of Haram Ramat el-Khalil which was already considered a sacred site in the Second Temple period.

Josephus relates that Abraham resided near Hebron, by an oak called ogyges, the oak of Genesis (Antiq. 1, 186). Elsewhere he mentions a terebinth 6 stadia from Hebron

that had stood there since creation (War IV, 533); it is not clear whether both references are to the same place. In Antiquities he tells the biblical story, calling the tree an oak: whereas in War of the Jews he is describing a holy place in his own time, calling it a terebinth. Josephus is mistaken about the distance between Elonei Mamre and Hebron, which is not 6 but approximately 18 stadia (3 km). Neither does he mention a structure around the terebinth. Modern excavations have made it clear that the structure was already standing in his time.

The book of Jubilees (29:17-19; 37:14-17) refers to Abraham's capital in the Hebron Hills as a tower (migdal). The reference is probably to Abraham's residence at Elonei Mamre. If so, the author, a contemporary of the Second Temple, was describing the enclosure at Elonei Mamre in terms associated with the Temple Mount - migdal or birah - both meaning tower or fortress. Talmudic literature refers to the place as Beth Ilanim or Botnah and it is mentioned as the site of one of the most important fairs in Palestine: "There are three fairs: the fair of Gaza, the fair of Acco, the fair of Botnah, and the least doubtful of them all is the fair of Botnah," meaning that of the three fairs this was the one most definitely associated with idolatry and therefore Jews were forbidden to participate in it (J.T. A.Z. 39c; Gen. Rab. 47:10). The fair is mentioned in two of Jerome's commentaries (In Hieremiam VI, 18, 6, CCSL 74, 307; In Zachariam III, 4-5. CCSL 76A, 851), where it is said that Hadrian brought the captive Jews to the famous marketplace at Terebinth. There he sold many into slavery. For this reason the Jews in Jerome's time shunned the annual fair. The same story is told in the seventh-century Chronicon Paschale (PG 92, col. 613) with some additions.

The Bordeaux Pilgrim (Itin. Burd. 599, 3-7) states that the emperor Constantine built a basilica there. Eusebius (Vita Constantini III. 51-53, GCS 7, 99-101) and Sozomenus (HE II, 4. GCS 50, 54-56) report the circumstances and the official documentation referring to the building. Both Julius Africanus (Chron. XVIII) and Eusebius (Vita Constantini III, 53, 100; Onom. 6. 12-14; 76. 1-3) mention a pagan altar at the site. The most detailed description of the site is in the work of Sozomenus. He reports that the place situated 15 stadia from Hebron, was the site of the terebinth, where the angels had appeared to Abraham. In summer, he states, a great fair was held there, attracting hordes of people from far away, who came to offer libations and burn incense, but also to trade; among them were pagans, Christians and Jews. The Medeba map seems to differentiate between Botna and Mamre, as the mosaic depicts both a church and a terebinth. During the seventh century CE there was a monastery at the site that continued to exist after the Arab conquest (Adamnanus, De Locis Sanctis II, II. 6, CCSL 175, 211). In Crusader times, the site may have been occupied by the Church of the Trinity.

Eusebius, Onomasticon 6:8-12 (ca. 295 A.D.); Jerome 7:18-24 (ca. 390 A.D.) Arboc. Corrupte in nostris codicibus Arboc scribitur, cum in Hebraeis legatur Arbe, id est quattuor, eo quod ibi tres patriarchae, Abraam, Isaac et Iacob, sepulti sunt, et "Adam Magnus", ut in Iesu libro scriptum est: licet eum quidam conditum in loco Calvariae suspicientur. Haec est autem eadem Chebron, olim metropolis Filistinorum et habita-culum gigantum, regnumque postea David, in tribu Iudae civitas sacerdotalis et fugitivorum. Distat ad meridianam plagam ab Aelia milibus circiter viginti duobus. (Jerome 7:11-18)

Et quercus Abraam, quae et Mambre, usque ad Costantii regis imperium monstrabatur, et mausoleum eius in praesentiarum cernitur, cumque a nostris ibidem ecclesia iam extructa sit, a cunctis in circuitu gentibus terebinthi locus superstitione colitur, eo quod sub ea Abraam angelos quondam hospitio suscepit. Haec ergo primum Arbe, postea a Chebron, uno filiorum Chaleb sortita vocabulum est. Lege Verba dierum.

Arbo (Gen 23:2). In our codices it is written in a corrupted form, 'Arboc', while the Hebrew text reads 'Arba', that is, 'four', because the three patriarchs, Abraham, Isaac and Jacob are buried there, as well as 'the great Adam', as is written in the Book of Joshua (Jos. 14:15), although some suppose that he is buried on the Calvary. 'That is Hebron', today a large village, in ancient times one of the main cities of the Philistines [Eusebius: 'the aliens', i.e. the Cannanites in general] and a dwelling place of giants, and later royal seat of David. It fell into the lot of the tribe of Judah, and was a priestly city and one of the cities of refuge. It is south of Jerusalem at a distance of about 20 [22] miles.

The oak of Abraham, also called Mambre, could be seen standing until the reign of

67975 Constantius, and the tomb of the same is visible to this day and while a church has been erected there by our people, the place of the oak is [greatly] venerated by all the pagan population around, because under it Abraham gave hospitality to the angels. At first the place was called Arbe, and later it was named Hebron after Hebron, one of the sons of Caleb, as we read in the Chronicles. (1 Chron 2:42).

67980 Sozomenus, Historia Ecclesiastica II, 4
I deem necessary to declare now what was resolved about the oak of Mambre by Emperor Constantine. The place is presently called the Terebinth, and is situated at the distance of fifteen stadia from Hebron, which is to the south... Every year, at summer time, the inhabitants of that place and the Palestinians, the Phoenicians and the Arabs, coming from far away, make a fair there. Many come there for the sake of
67985 business, some to sell and some to buy. The feast is celebrated by a very big congregation of Jews, since they boast of Abraham as their forefather, of heathens since angels came there, of Christians since he who should be born from the Virgin for the salvation of humankind appeared there to that pious man. Everyone venerates this place according to his religion: some praying God the ruler of all, some calling
67990 upon the angels and offering libations of wine, burning incense or sacrificing an ox, a pig, a sheep or a cock. Constantine's mother in law (Euthropia), having come there to fulfill a vow, gave notice of all this to the Emperor. So he wrote to the bishops of Palestine reproaching them for having forgot their mission and permitted such a most holy place to be defiled by those libations and sacrifices.

67995 Eusebius, The Life of Constantine: Constantinopel
CHAPTER XLVIII: How he built Churches in Honor of Martyrs, and abolished Idolatry at Constantinople.
AND being fully resolved to distinguish the city which bore his name with especial honor, he embellished it with numerous sacred edifices, both memorials of martyrs on
68000 the largest scale, and other buildings of the most splendid kind, not only within the city itself, but in its vicinity: and thus at the same time he rendered honor to the memory of the martyrs, and consecrated his city to the martyrs' God. Being filled, too, with Divine wisdom, he determined to purge the city which was to be
68005 distinguished by his own name from idolatry of every kind, that henceforth no statues might be worshiped there in the temples of those falsely reputed to be gods, nor any altars defiled by the pollution of blood: that there might be no sacrifices consumed by fire, no demon festivals, nor any of the other ceremonies usually observed by the superstitious.

68010 CHAPTER XLIX: Representation of the Cross in the Palace, and of Daniel at the Public Fountains.
ON the other hand one might see the fountains in the midst of the market place graced with figures representing the good Shepherd, well known to those who study the sacred oracles, and that of Daniel also with the lions, forged in brass, and resplendent
68015 with plates of gold. Indeed, so large a measure of Divine love possessed the emperor's soul, that in the principal apartment of the imperial palace itself, on a vast tablet displayed in the center of its gold-covered paneled ceiling, he caused the symbol of our Saviour's Passion to be fixed, composed of a variety of precious stones richly inwrought with gold. This symbol he seemed to have intended to be as it
68020 were the safeguard of the empire itself.

Eusebius, The Life of Constantine: Constantinopel
CHAPTER LVIII: Concerning the Building of a Church in Honor of the Apostles at Constantinople.
68025 AFTER this he proceeded to erect a church in memory of the apostles, in the city which bears his name. This building he carried to a vast height, and brilliantly decorated by encasing it from the foundation to the roof with marble slabs of various colors. He also formed the inner roof of finely fretted work, and overlaid it throughout with gold. The external covering, which protected the building from the
68030 rain, was of brass instead of tiles; and this too was splendidly and profusely adorned with gold, and reflected the sun's rays with a brilliancy which dazzled the distant beholder. The dome was entirely encompassed by a finely carved tracery, wrought in brass and gold.

68035 CHAPTER LX: He also erected his own Sepulchral Monument in this Church.
ALL these edifices the emperor consecrated with the desire of perpetuating the memory of the apostles of our Saviour. He had, however, another object in erecting this building: an object at first unknown, but which afterwards became evident to all. He

68040 had in fact made choice of this spot in the prospect of his own death, anticipating
with extraordinary fervor of faith that his body would share their title with the
apostles themselves, and that he should thus even after death become the subject,
with them, of the devotions which should be performed to their honor in this place.
He accordingly caused twelve coffins to be set up in this church, like sacred pillars
68045 in honor and memory of the apostolic number, in the center of which his own was
placed, having six of theirs on either side of it. Thus, as I said, he had provided
with prudent foresight an honorable resting-place for his body after death, and,
having long before secretly formed this resolution, he now consecrated this church to
the apostles, believing that this tribute to their memory would be of no small
68050 advantage to his own soul. Nor did God disappoint him of that which he so ardently
expected and desired. For after he had completed the first services of the feast of
Easter, and had passed this sacred day of our Lord in a manner which made it an
occasion of joy and gladness to himself and to all; the God through whose aid he
performed all these acts, and whose zealous servant he continued to be even to the
end of life, was pleased at a happy time to translate him to a better life.

68055 CHAPTER LXX: His Burial by his Son Constantius at Constantinople.
THUS did they there testify their respect for the memory of him who had been honored
by God. The second of his sons, however, who had by this time arrived, proceeded to
celebrate his father's funeral in the city which bears his name, himself heading the
68060 procession, which was preceded by detachments of soldiers in military array, and
followed by vast multitudes, the body itself being surrounded by companies of
spearmen and heavy armed infantry. On the arrival of the procession at the church
dedicated to the apostles of our Saviour, the coffin was there entombed. Such honor
did the youthful emperor Constantius render to his deceased parent, both by his
68065 presence, and by the due performance of this sacred ceremony.

Chapter LXXI: Sacred Service in the Church of the Apostles on the Occasion of
Constantine's Funeral.
AS soon as [Constantius] had withdrawn himself with the military train, the ministers
68070 of God came forward, with the multitude and the whole congregation of the faithful,
and performed the rites of Divine worship with prayer. At the same time the tribute
of their praises was given to the character of this blessed prince, whose body rested
on a lofty and conspicuous monument, and the whole multitude united with the priests
of God in offering prayers for his soul, not without tears, – nay, rather with much
68075 weeping; thus performing an office consonant with the desires of the pious deceased.
In this respect also the favor of God was manifested to his servant, in that he not
only bequeathed the succession of the empire to his own beloved sons, but that the
earthly tabernacle of his thrice blessed soul, according to his own earnest wish, was
permitted to share the monument of the apostles; was associated with the honor of
68080 their name, and with that of the people of God; was honored by the performance of the
sacred ordinances and mystic service; and enjoyed a participation in the prayers of
the saints. Thus, too, he continued to possess imperial power even after death,
controlling, as though with renovated life, a universal dominion, and retaining in
his own name, as Victor, Maximus, Augustus, the sovereignty of the Roman world.

68085 CHAPTER I: Preface. – Of the Death of Constantine.
ALREADY have all mankind united in celebrating with joyous festivities the completion
of the second and third decennial period of this great emperor's reign; already have
we ourselves received him as a triumphant conqueror in the assembly of God's
68090 ministers, and greeted him with the due mead of praise on the twentieth anniversary
of his reign: and still more recently we have woven, as it were, garlands of words,
wherewith we encircled his sacred head in his own palace on his thirtieth
anniversary.
But now, while I desire to give utterance to some of the customary sentiments, I
68095 stand perplexed and doubtful which way to turn, being wholly lost in wonder at the
extraordinary spectacle before me. For to whatever quarter I direct my view, whether
to the east, or to the west, or over the whole world, or toward heaven itself,
everywhere and always I see the blessed one yet administering the self-same empire.
On earth I behold his sons, like some new reflectors of his brightness, diffusing
68100 everywhere the luster of their father's character, and himself still living and
powerful, and governing all the affairs of men more completely than ever before,
being multiplied in the succession of his children. They had indeed previously the
dignity of Caesars; but now, being invested with his very self, and graced by his
accomplishments, for the excellence of their piety they are proclaimed by the titles

68105 of Sovereign, Augustus, Worshipful, and Emperor.

Church of the Holy Apostles

68110 The grounds of the first church of the Holy Apostles contained both a rotunda mausoleum built by Constantine and a church built soon afterward by his successor Constantius. Little is known of the appearance of this original church except that it was cross-shaped, but the historian Eusebius (c. 263-339) gives a description of Constantine's mausoleum and the surrounding grounds before Constantius' church was built.

68115 Such was the magnificence with which the emperor was pleased to beautify this church. The building was surrounded by an open area of great extent, the four sides of which were terminated by porticoes which enclosed the area and the church itself. Adjoining these porticoes were ranges of stately chambers, with baths and promenades, and besides many apartments adapted to the use of those who had charge of the place. The cruciform plan was a landmark development in Christian architecture, because it replaced a basilica plan with the centralized shrine plan. Dozens of cruciform church buildings in the late fourth and early fifth centuries were rough imitations of the Constantine-era Church of the Holy Apostles, such as St. Ambrose's Church of the Apostles in Milan, the martyrrium of St. Babylas in Antioch, and the Church of Saint Simeon Stylites in Aleppo, Syria.

68125 See too CONSTANTINE'S CHURCHES by GREGORY T. AMSTRONG

68130 The original church of the Holy Apostles was dedicated in about 330 by Constantine the Great, the founder of Constantinople, the new capital of the Roman Empire. The church was unfinished when Constantine died in 337, and it was brought to completion by his son and successor Constantius II, who buried his father's remains there. The church was dedicated to the Twelve Apostles of Jesus, and it was the Emperor's intention to gather relics of all the Apostles in the church. For this undertaking, only relics of Saint Andrew, Saint Luke and Saint Timothy (the latter two not strictly apostles) were acquired, and in later centuries it came to be assumed that the church was dedicated to these three only.

68135 By the reign of the Emperor Justinian I, the church was no longer considered grand enough, and a new Church of the Holy Apostles was built on the same site. The historian Procopius attributes the rebuilding to Justinian, while the writer known as Pseudo-Codinus attributes it to the Empress Theodora. The new church was designed and built by the architects Anthemius of Tralles and Isidorus of Miletus, the same architects of the Hagia Sophia, and was consecrated on 28 June 550. The relics of Constantine and the three saints were re-installed in the new church, and a mausoleum for Justinian and his family was built at the end of its northern arm.

68145 For more than 700 years, the church of the Holy Apostles was the second-most important church in Constantinople, after that of the Holy Wisdom (Hagia Sophia). But whereas the church of the Holy Wisdom was in the city's oldest part, that of the Holy Apostles stood in the centre of the newer part of the much expanded imperial capital, on the great thoroughfare called Mese Odós (English: Central Street), and was the city's busiest church. Most emperors and many patriarchs and bishops were buried in the church, and their relics were venerated by the faithful for centuries.

68155 The church's most treasured possessions were the skulls of Saints Andrew, Luke and Timothy, but the church also held what was believed to be part of the "Column of Flagellation", to which Jesus had been bound and flogged. Its treasury also held relics of Saint John Chrysostom and other Church Fathers, saints and martyrs. Over the years the church acquired huge amounts of gold, silver and gems donated by the faithful.

68160 Emperor Basil I renovated and probably enlarged the church, and in 874 the remains of the historian and patriarch Nikephoros I, who had died earlier in the century, were reinterred in the popular and rebuilt church, where they became the site of annual imperial devotion. In the 10th century Constantine of Rhodes composed a Description of the building of the Apostles in verse, which he dedicated to Constantine VII. The basilica was looted during the Fourth Crusade in 1204. The historian Nicetas Choniates records that the Crusaders plundered the imperial tombs and robbed them of gold and gems. Not even Justinian's tomb was spared. The tomb of Emperor Heraclius was opened and his golden crown was stolen along with the late Emperor's hairs still attached on it. Some of these treasures were taken to Venice, where they can still be seen in St Mark's Basilica, while the body of St. Gregory was brought to Rome.

68170 When Michael VIII Palaeologus recaptured the city from the Crusaders, he erected a

statue of the Archangel Michael at the church to commemorate the event, and himself. The church was partially restored again by Andronicus II Palaeologus in the early 14th century, but thereafter fell into disrepair as the Empire declined and Constantinople's population fell. The Florentine Cristoforo Buondelmonti saw the dilapidated church in 1420.

Uit: <http://www.roger-pearse.com/weblog/2013/12/18/more-on-the-tombs-of-the-emperors-at-the-church-of-the-holy-apostles-in-constantinople/>

The shape of the Heroon of Constantine is said by Mesarites to be circular, with a dome. Mesarites tells us that the mausoleum of Justinian had many "stoaed" (i.e. pillared) corners, so perhaps that was octagonal or hexagonal or something like that. However the arrangement of the tombs within the Heroon, by 400 AD, schematically, was as follows:

Entry to the building was from the west. Mesarites tells us that, in the principal place, at the east end, was the tomb of Constantine the Great. To the south was that of Constantius II, while the tomb of Theodosius the Great was to the north.

Let's hear from Mesarites:

XXXIX. But let us, if you please, go off to this church which lies toward the east, so that we may look at the things in it, in order to admire and describe them-this church whose founder our discourse has already declared to be Constantius. 2. This whole church is domical and circular, and because of the rather extensive area of the plan, I suppose, it is divided up on all sides by numerous stoaed angles, for it was built for the reception of his father's body and of his own and of the bodies of those who should rule after them. 3. To the east, then, and in first place the body of Constantine, who first ruled the Christian Empire, is laid to rest within this purple-hued sarcophagus as though on some purple-blooming royal couch - he who was, after the twelve disciples, the thirteenth herald of the orthodox faith, and likewise the founder of this imperial city. 4. The sarcophagus has a four-sided shape, somewhat oblong but not with equal sides. The tradition is that Helen, his mother and his fellow-worker for the orthodox faith, is buried with her son. 5. The tomb toward the south is that of the famous Constantius, the founder of the Church. This too is of porphyry color but not in all respects similar to the tomb of his father, just as he who lies within it was not in all ways similar to his father, but was inferior to his father, and followed behind him, in piety and in mental endowment. 6. The tomb toward the north and opposite this, and similar to those which have been mentioned, holds the body of Theodosius the Great like an inexhaustible treasure of noble deeds. 7. The one toward the east, closest to this one, is that of Pulcheria. She is the honored and celebrated founder of the monastery of the Hodegon; see how she, a virgin herself, holds in her hands the likeness of the all-holy Virgin. ... Additional tombs, after Theodosius, were inserted later around the walls.

The Chronicon Altinate gives a list of emperors and their lengths of reigns. It is of interest to us for what it says about the emperors in the mausoleum. Starting on p. 62 of MGH supplement 14:

Constantine, son of Constantius, born in Britain from the concubine Helena - the city in his name is in Thrace - ... died on the 20th of May, a great and most Christian emperor. His remains were placed in the church of the Holy Apostles in the sacrarium, which he himself also built, in a porphyry "pila". ...

Constantius ... son of Constantine reigned for 24 years. Constantine [sic] died on 3rd November and his body was placed in the church of the Holy Apostles in a porphyry "pila".

Julian the apostate His body was brought to Constantinople and placed in the western part in the church of the Holy Apostles in a porphyry "labrum". ...

On the 27th September Juvian [sic] died, most religious emperor, in Thichera a city of Galicia, and his body was brought to Constantinople, in the church of the Holy Apostles, in the porphyry "labrum" of the great Constantine. After this his wife was placed in the same "labrum". He reigned 8 months.

... (the body of Valens was not found) ...

[Valentinian]'s body was brought in the time of Theodosius the Great and placed in the church of the Holy Apostles where Constantine the Great [was] in a porphyry "lanarx". ...

On the 7th of January died the emperor Theodosius the Great at Milan. His remains were brought to Constantinople and placed in the church of all the holy Apostles, in the sacrarium of Constantine the Great, in a porphyry "pila"; where also his wife Pracilla had previously been placed.

On the 1st May died the emperor Arcadius and his body was placed in the church of all the Holy Apostles in a porphyry "pilla" [sic] in the middle portico with his wife Eudokia, who before she died [acted] to the injury of St. John Chrysostom. ...

68240

The Serpent Column of Delphi in Constantinople

There is no record of the Serpent Column's removal from Delphi in the early fourth century, but there are numerous references among Roman sources to its arrival on the Bosphorus. Constantine I's importation into the capital of a great many divine and profane statues was an embarrassment to his Christian friends. Eusebius claimed that the emperor collected and displayed the artworks only to demonstrate that the idols of the past were now decoration to be laughed at or scorned. Sozomenus and Socrates echoed this in their continuations of Eusebius' Church History. Eusebius did not mention the Serpent Column directly, but rather that 'the Delphic tripods were deposited in the Hippodrome.' Sozomenus, however, explicitly recorded that among them was the famous tripod which Pausanias and the Greek cities dedicated after their victory over the Persians.

The Column of Constantine (Turkish: Çemberlitaş Sütunu, from çemberli 'hooped' and taş 'stone'), also known as the Burnt Stone or the Burnt Pillar, is a Roman monumental column constructed on the orders of the Roman emperor Constantine the Great in 330 AD. It commemorates the declaration of Byzantium (renamed by Constantine as Nova Roma) as the new capital city of the Roman Empire. The column is located on Yenîçeriler Caddesi in the eponymous neighborhood of Çemberlitaş, Fatih, central Istanbul, along the old Divan Yolu (the 'Road to the Imperial Council') between the Hippodrome of Constantinople (now Sultanahmet Square) and the Forum of Theodosius (now Beyazıt Square).

68260

68265

The Column of Constantine is one of the most important examples of Roman art in Istanbul. The column is 35 meters tall today. Restoration work has been under way since 1955. Cracks in the porphyry were filled and metal brackets renewed in 1972. Since 1985, the monuments of the historic peninsula of Istanbul, including the column, have been listed as a World Heritage Site.

68270

The column was dedicated on May 11, 330 AD, with a mix of Christian and pagan ceremonies.

68275

In Constantine's day the column was at the center of the Forum of Constantine (today known as Çemberlitaş Square), an oval forum situated outside the city walls in the vicinity of what may have been the west gate of Antoniniana. On its erection, the column was 50 meters tall, constructed of several cylindrical porphyry blocks. The exact number of porphyry blocks is disputed, but common figures range from seven, up to as many as eleven. These blocks were surmounted by a statue of Constantine in the figure of Apollo. The orb he carried was said to contain a fragment of the True Cross. At the foot of the column was a sanctuary which contained relics allegedly from the crosses of the two thieves who were crucified with Jesus Christ at Calvary, the baskets from the loaves and fishes miracle, an alabaster ointment jar belonging to Mary Magdalene and used by her for anointing the head and feet of Jesus, and the palladium of ancient Rome (a wooden statue of Pallas Athena from Troy).

68280

68285

A strong gale in 1106 AD felled the statue and three of the upper cylinders of the column. Some years later, Byzantine emperor Manuel I Komnenos (reigned 1143-1180) placed a cross on top in place of the original statue and added a commemorative inscription that read "Faithful Manuel invigorated this holy work of art, which has been damaged by time". Bronze wreaths once covered the joints between the drums, but these were taken by the Latin Crusaders who plundered the city during the Fourth Crusade in 1204. The cross was removed by the Ottoman Turks after the fall of Constantinople in 1453.

68290

68295

Earthquakes and a fire in 1779 destroyed the neighborhood surrounding the column, leaving it with black scorch marks and earning it the name 'Burnt Column' (or, as referred to by Gibbon, the "burned pillar"). The column was restored by Abdülhamid I, who had the present masonry base added. The base was strengthened in 1779. The original platform of the column is 2.5 meters below ground.

Helios and the Emperor in the Late Antique Peloponnese

GEORGIOS DELIGIANNAKIS

68375

68380

This paper discusses a badly damaged over-life-sized marble head with radiate headgear found in the Roman theater of Gytheum. It probably belonged to a public statue or shield monument of the god Helios and is thought to be late antique. It is here argued that this monument was in fact intended to pay honor to the ruling emperor, who was associated with the god Helios. It is also suggested that the association of the new Flavian dynasty with the solar god represents a particular way by which the people of Greece, among other provincials, chose to express their loyalty to the emperor along traditional religious lines.

Description and Identification

68385

68395

68400

68405

68410

68415

68420

68425

68430

The head is carved of local beige marble, with a height of 0.52 meters and a width of 0.37 meters. It has a strong frontal rendering and cursorily curved features. It may be reworked from a previous piece (Figs. 1-5). It now appears severely damaged due to later re-use; the back side is hollowed out. It seems that the head was later placed upside-down and the newly carved concavity used as a fountain urn. It features large almond-shaped eyes, wide-open. Boldly emphasized eyelids frame the eyeballs. The damaged nose is wedge-shaped and crudely modelled. The mouth simply appears as a horizontal sharpcut across thickly modeled lips. The ears are rendered by curved incisions in very low relief. The hair projecting in front of the forehead is a compact mass, defined against the flesh by a continuous chisel-line above the forehead. The hair is rendered in a cursory way as being thick and long and brushed back-wards on all sides of the head; superficially incised chisel lines on the left and right temple can be discerned; below the left ear the head is broken off. Seven rectangular mortises (0.02 m×0.03 m) are still visible, chiseled above the hairline for the support of metal inserts. Their number, size, and near rectangular shape suggest that these deep mortises were most probably intended for the insertion of metal rays. Near the center of the cranium, a thin metal spike is still preserved. If this is a feature of the head and not a later addition, it may be a dowel for the attachment of a separate piece of stone to complete the top of the head. The head gives the impression that it was left unfinished. Yet the sockets for metal rays and the metal spike on the top of the head leave little doubt that this piece, together with the rest of the monument of which it presumably was a part, had been placed on display in antiquity.

Despite its bad condition, the characteristic headgear identifies this as an image of the god Helios. Its style and technique places it chronologically after the collapse of the provincial sculpture workshops in Late Antiquity, which can be roughly placed after the 270s. Thereafter only a few workshops, located mostly in provincial capitals or big cities, were able to produce high-quality portrait sculpture for the needs of local elites and for representatives of the imperial government. The rendering of the frontal, bulging eyes, awkwardly placed on the face, appears similar to the style of a life-sized portrait head made of local marble and found in the theater of Sparta. In the case of the Spartan head, which probably portrayed a local dignitary or a provincial governor, the pupils of the eyes are drilled. Its excavators suggested a date close to the last phase of the theater, about 375-400 (Fig. 6). Moreover, two late antique statues of similar technique and style, one an imperial portrait (probably Constantine I), from an urban mansion in Messene can be approximately dated on archaeological grounds to no later than 360/70. Based on its late antique style and crude technique, the Gytheum head could be dated to any period from the late third century onwards. Yet it is its possible connection to imperial imagery, as we will see below, which provides a more specific chronological and historical context, in the second or third quarter of the fourth century.

In a period when the local production of sculpture had sharply decreased and the cutting of new pieces of life-size sculpture depicting mythological themes was rare, the discovery of this head from Gytheum is striking.

Gytheum in southernmost Laconia was the most important city of the region and the major port for exporting the famous local green porphyry stone in Roman times. The *Expositio totius mundi et gentium* (composed around 359-360) singles out "Laconica" as one of the three districts of the province of Achaia. By "Laconica" one should understand the cities of the League of the Free Laconians, rather than Sparta. Thinking in commercial terms, the author of *Expositio* adds, "it is considered to be rich in one product alone, the stone of Crocinum which they call 'Lacedaemonian'."

68435 The Tabula Peutingeriana (Tetrarchic to fifth century) names Gytheum, along with Asopos and Boeae as part of the late Roman cursus publicus. Moreover, the late Roman imperial fleet probably used Gytheum as an occasional port of call on the east-west sea route, while auxiliaries in the Roman army from Sparta and Laconia are attested in the second and third centuries.

68440 It is important to ask why the people of Gytheum decided to erect this imposing statue of a pagan god in the public domain, despite its poor work-manship and deviation from the trends that we postulate about late antique public statuary in Greece and the Greek East, when we find almost no public statuary monuments with polytheistic themes. The choice of a pagan god whose cult was of little popularity in

68445 Greece but with strong links to Hellenistic and imperial perceptions of rulership, along with the fact that the majority of public statuary in Late Antiquity normally consisted of images of the emperor, suggest a connection between this mythological figure and the ruling emperor.

68450 Drawing on extensive previous scholarship in this field, Bergmann and Bardill have recently offered a systematic study of the use and meaning of the radiate portrait by Hellenistic and Roman rulers as well as the relation of solar imagery to imperial iconography. Bardill points out that Constantine had tried to re-employ iconographic traits of Alexander, Augustus and Nero, among them an association with the god Apollo-Helios and the use of the radiate crown. The statue of Constantine as Apollo-

68455 Helios on the porphyry column in Constantinople had an obvious precursor in the statue of Augustus on a column in the precinct of Apollo on the Palatine Hill, and also the "Colossus of Nero" in Rome. Although many later emperors had worn radiate crowns on coins, only with Constantine did this attribute convey a profound solar aspect in the guise of Sol Invictus, with the exception of Aurelian (reigned 270-275).

68460 In fact, a fascination with solar imagery and the imagery of light as an attribute of imperial rule under divine guidance would endure until the end of his life, whether expressed in a traditional religious context or a Christian one. By 310 Constantine officially declared Sol as his new religious patron. The Latin panegyrist of 310 has him witness a vision from Sol while on a military campaign, near an important

68465 sanctuary of Apollo Grannus in Gaul. All of Constantine's imperial mints for the years from 310 to 317 massively produced copper alloy coins that displayed Sol on the reverse. He also adopted the legend SOLI INVICTO on his gold solidi as well as the epithet INVICTUS as part of his personal titulature. After his victory over

68470 Maxentius, Constantine issued a gold medallion (Ticinum, 313) showing Constantine's bust overlapping that of Sol wearing a radiate crown; on the shield of the emperor, Sol in his horse-drawn chariot rises from the ocean (Fig. 7). Constantine and Sol were overtly juxtaposed on the Arch of Constantine dedicated in 315 in Rome and also the colossal statue of Sol nearby. Even after Constantine began to advertise his conversion to Christianity, the images of Sol and Constantine continued to be

68475 featured together on the gold solidi of various mints between 316 and 324 or 325, describing Sol as the protector of Constantine. In this period, Sol probably provided a unifying bridge between Licinius's paganism and Constantine's Christian God. Furthermore, Licinius's troops in 324 marched against Constantine under Sol's protection, while Constantine too seems to have celebrated his victory over his

68480 opponent with gold solidi bearing the legend SOLI COMITI AUG. Even though after 325 or 326 Constantine abandoned Sol Invictus on his coins and his support for Christianity became more manifest, the erection of the colossal radiate statue in Constantinople as late as 328 or 330 shows that Constantine continued to promote his solar associations in a way that easily appealed to a pagan and a Christian audience.

68485 In various sources of this period the solar imagery is now used to symbolize the eternity of Constantine's unified rule, the beginning of a Golden Age, but also the coming of a new Christian era.

The most remarkable monument that associated Constantine with Helios, which is also the most pertinent to our discussion, is the colossal bronze statue of Constantine on

68490 a porphyry column in the middle of his forum in Constantinople (Fig. 8). Its model was apparently the Colossus of Sol in Rome, which was erected by Nero and later moved to the Colosseum. Constantine's New Colossus was erected in 328 or 330 but is now lost. Only the column survives, truncated, but later textual sources refer to the statue above. It wore a radiate crown and carried a spear in one hand and a globe in

68495 the other. Whether it was naked or draped is not certain, as comparative evidence suggests either possibility. Most modern scholars agree that the image of Constantine incorporated the identity of Apollo-Helios. Writing in the sixth century, Hesychius mentions "the notable porphyry column on which we see Constantine set up, shining forth to his citizens in the manner of the sun". He gives an interpretation of the

68500 image that emphasizes the element of solar and divine radiance of the emperor, while

avoiding any explicit pagan association, and in that it seems to reflect to a great extent the way Christians viewed it. Later texts make explicit that the figure was a statue of Apollo (Patria) or Helios (Anna Comnena, Zonaras) re-used by Constantine, something that may be taken as yet another indirect proof of the intentional religious ambiguity of the message that the monument had originally intended to transmit. Another sixth-century source, Malalas, reports that the statue bore seven rays on his head, as in our example from Gytheum. Constantine's crown probably had angled, rather than vertical, rays, of a type that appeared often in the iconography of Hellenistic kings as well as the representation of Nero-Helios, thus making later observers identify it with the Sun god. An illusion to the sun could also be contained in the inscription that was probably placed on the base of the column, whose text (or part of it) is given by a mid-tenth century source. Constantine's adoption of the diadem, of Sol-Apollo as the dynasty's protector, and the Apolline portrait (modeled on Alexander and Augustus) denoted a striking break with previous Tetrarchic traditions. The new message offered different readings to his subjects. With the majority of the empire's population still pagan, it is reasonable to suppose that most would have tried to situate the emperor against traditional religious forms of mediation, foremost the imperial cult and the assimilation of the person of the emperor with ancestral cults. The promotion of Sol Invictus as the heavenly protector of the emperor provided a universal point of reference. It was this parallel association with Apollo-Helios and a Hellenistic royal style in his official self-representation that probably shaped how a Greek-speaking population sought to naturalize the official imperial message. The following examples illustrate this dynamic. Sometime between 324 and 337, the city of Termessos in Pisidia erected a monumental equestrian bronze statue in which the emperor Constantine was honored in the guise of the local god Helios Panteoptes, "All-Seeing Sun" (Fig. 9). The latter appears on the city's past bronze coins with a radiate crown and riding on a horse; it seems that the equestrian statue along with the inscribed block were re-used to create an image of Constantine from a previous dedication to the local solar god. There seems to be only a single way to interpret this evidence: the people of Termessos tried to respond to the strong solar associations of the new Flavian dynasty by assimilating him with a local solar deity. On the inscription of a statue dedication to Constantine in Lepcis Magna in Libya Tripolitania, we read that the provincial governor set up a marble statue that "was radiant by his divine spirit to our lord Constantine, most powerful victor, eternal Augustus" (dated between 324 and 326). The language is more allusive here, but as Tantillo suggested, a badly damaged imperial head of Julio-Claudian date, which was re-carved and given seven holes for the insertion of metal rays, possibly came from the same monument. Another example is a reused portrait head of a clean-shaven man from Augusta Treverorum (Trier), who is wearing a diadem and radiate crown and has also been identified with Constantine. A fourth example is a reused bust of Caracalla with a dedication to Constantine, found in a Mithraeum in Rusica in Numidia. Constantine's name replaced that of Caracalla. In the inscription, the emperor is addressed with the standard epithet of Sol: "to the divine spirit (numini) of the most sacred (sanctissimi) and invincible (invictissimi) Constantine." Furthermore, a group of late antique images, which have long been only tentatively identified as reproducing radiant portrait images of Constantine in minor form (for private veneration?), further underline how fertile the ground was for the cultivation of this particular assimilation of the emperor with Sol. Each of them, it has been suggested, may be a reminiscent of the image of a radiate Constantine holding the Tyche of the city of Constantinople, which on the day of the city's anniversary would be paraded on a golden chariot into the hippodrome and parked before the imperial box, or that of the forum. Returning to the Gytheum head, it was found in the Roman theater, but we cannot rule out that the monument stood in the nearby Kaisareion of the city. The Kaisareion is only epigraphically attested but is believed to have been part of the so-called "Roman Agora", located close to the theater. According to the well-known lex sacra of Gytheum (15 CE), the sacred procession of the local Kaisareion passed by different sanctuaries of the city and finally reached the Kaisareion and the Agora, where sacrifices took place; then the sacred images of the emperor and his family (probably panel paintings) were carried to the theater, where they could watch the festivities. The head, whether originally erected in the theater, or the Kaisareion, could be linked to the local festival of the imperial cult, which is epigraphically attested until the late third century. The connection with the festival of the imperial cult in the reign of Constantine in Gytheum is also likely, since a priest of the imperial cult is attested at Sparta in 325 or 329. Could the veneration of the person of the

emperor also be embedded in a traditional local cult of the god Helios in Gytheum or its periphery? An honorific inscription dated to the imperial period refers to a local priesthood of Helios and Selene. One may assume that the cults of Septimius Severus and Julia Domna, who had been closely associated with that divine couple, and later that of Constantine, were integrated into this local cult. Be that as it may, a temple of the god Helios in Gytheum is not known. Regarding cults of Helios in Laconia, we know of a sanctuary of Helios in Taleton on the peak of Taygetos; an oracle sanctuary of Ino-Pasiphae (Selene) at Thalamae, where Helios was also worshipped; and a place sacred to Helios on the Tainaron promontory mentioned in the Homeric hymn to Apollo. It is impossible to know whether the foundation of the statue of Helios was connected to these Laconian ancestral cults, or was anchored in a previous cult of Helios and Selene at Gytheum.

I would propose instead that the Gytheum head should be understood along the same lines as the above examples, that is, as an attempt on the part of the local community to read the solar associations of Constantine's official image through a local religious idiom. The transcendent power of the association between Constantine and Apollo-Helios in Achaia is explicitly attested by the issue of a bronze coin of Constantine from the mint of Thessalonica, which together with Achaia was part of the diocese of Macedonia, featuring a unique iconographic type on its reverse: Sol Invictus together with an enigmatic solar pattern made of overlaid X-formations (Fig. 10). It is dated to 319, that is, only two years after the annexation of Illyricum by Constantine.

The veneration of an emperor styled as Apollo-Helios in the Greek East had a striking precedent in the case of Nero. Drawing on the model of Alexander and Augustus, Nero associated himself with solar and Apolline aspects, wishing to express his aspiration for a new Golden Age of peace and prosperity. He too appeared wearing a radiate crown on coins, while his Colossus in Rome was presumably the model for Constantine's similar statue in New Rome. In response to court propaganda that linked the emperor with Apollo and Helios, Greek cities venerated Nero as New Apollo (at Athens) and New Helios (at Akraiphia in Boeotia and at Sagalassos in Pisidia). It is therefore likely that the strong similarities between the ideological package of Nero and that of Constantine (including a close association with Sol-Helios-Apollo; the imitation of Augustus's persona; the Golden Age; the Colossi) stimulated similar initiatives on the part of the Greek provincials of Greece and Pisidia, while striving to pay honor to a benevolent emperor associated with Apollo-Helios.

I have so far argued that the Gytheum head can be associated with public honors to the emperor Constantine, based on the strong solar imagery of his official representation and the receptiveness of this particular aspect of his image into local contexts, as the numerous examples presented above show. It should be noted that Licinius and Julian too were associated with Sol Invictus, yet the almost total absence of public dedications to these emperors in Achaia, the shorter period of their reigns, and the lack of similar evidence proving the connection of Helios and these emperors on a provincial level in Achaia or elsewhere make Constantine our most plausible candidate.

If we accept the proposed identification, the earliest chronological context of the Gytheum head should be the year 317, when Constantine took control of the province of Achaia. Since Constantine felt no qualms about representing the Sun god as his divine companion on coins down to 325 and 326 (at least on the gold), and his Colossus was erected in Constantinople as late as 328 or 330, it is possible to place the Gytheum head any time between 317 and Constantine's death in 337. Besides, pagans preferred to associate Constantine and his successors with the sun long after their conversion to Christianity.

68620 Greece and Constantine

By exploring additional aspects of the regional history of Greece in the early fourth century, the present section seeks to set the Helios head of Gytheum in a wider historical context. I begin by highlighting a serious landmark in the late Roman history of the province of Achaia: the regaining of its proconsular status after a short interlude during the Tetrarchy. This occurred either after a joint decision of Constantine and Licinius in 314 or – more probably – by Constantine alone, after he took control of Illyricum from Licinius in 317. A remarkable number of statue dedications to Constantine and his sons are attested in Greece. They come from even insignificant cities, to the extent that these stones are often the only late antique public inscription, or the last attested, from the site.

Julian in his Speech of Praise for Constantius mentions that the Athenians had granted the title of strategos of the Athenians to Constantine and also dedicated to

him a statue with an elaborate inscription. Greatly pleased with this action, which gave him "more than the highest honors", Constantine bestowed on the city an annual gift of many tens of thousands of bushels of wheat. A series of statue dedications to Constantine and his sons (in Latin) were recently discovered near the Roman Agora. Two prominent Athenians were closely connected with Constantine; one is Nicagoras, son of Minucianus, a cultured man and priest of Eleusis, who travelled at the emperor's expense to the Valley of the Kings in Egypt in 326. He left two graffiti in the tomb of Ramses VI in the Valley of the Kings near Thebes commemorating his visit and naming his benefactor, "the most pious emperor Constantine". There was also the Athenian Praxagoras, who wrote a flattering history of Constantine in two books, of which only small fragments survive.

A third possible example is Onasimus, a historian and rhetorician, who was a citizen of Sparta or Athens (or both) and wrote an Encomium of Constantine.

The aim of Nicagoras's mission at Thebes is puzzling. For several scholars, by sponsoring it Constantine intended to favor the pagan aristocracy of Athens and present himself as a friend of the arts. Moreover, Fowden has suggested that Constantine entrusted Nicagoras to visit Egypt and secure the removal of two obelisks, which were later erected on the spina of the Circus Maximus in Rome and of the hippodrome in Constantinople, and a porphyry column for his Colossus in Constantinople. As he notes, this project should be understood as a conciliatory move by Constantine, who had already started to favor Christianity, towards the pagan establishment of his Empire. Constantine's favors to Athens, a predominately pagan city and center of learning, are customarily interpreted in the same way.

There is much scholarly discussion about the motives and the circumstances of the removal of statues and other religious objects from Greek cities by Constantine. The emperor had dispatched officials to travel through the provinces and confiscate treasures from Greek sanctuaries either to melt them down into bullion or to transport them to Constantinople. Despite what Eusebius wanted his readers to believe (that Constantine wanted his subjects to ridicule pagan art), the emperor really intended to adorn and glorify the new city with the art and iconic cultural symbols of the Greek East. The removal and transfer of temple treasures from the provinces apparently intensified around 330. The famous Panhellenic victory monument of the battle of Plataea (479 BCE), the Serpent Column of Delphi, together with a statue of Apollo and sacred tripods, were removed and placed on the spina of the hippodrome of Constantinople. It accompanied other victory monuments, images of public figures and other spolia that intended to denote the supremacy and grandeur of the city, graced by the authority of the Greek and Roman past. A group (or groups) of Muses from the Museion on Mount Helicon in Thespieae was also sent to Constantinople. It is striking that Nicagoras, a priest of the Eleusinian mysteries, would be assigned a mission that many pagans may have regarded as a sacrilege, as many expressed their indignation at the stripping of temples of their treasures and holy objects by Constantine's agents. However, both Delphi and Thespieae, whose artworks were removed, honored Constantine and his sons with several statue monuments. On the flip side, Constantine showed his favor towards the Pythian priesthood, even though Delphi may have also been responsible for instigating the renewal of the persecution against the Christians by Diocletian. Indeed, this implies a reciprocal process between Constantine and the prominently pagan local establishment. Local elites had consented to Constantine's policy of confiscating temple treasures, and in the case of Nicagoras may have been involved in it, perhaps in exchange for favors or other local privileges. On the other hand, this may be the reason why so few artworks from mainland Greece are reported in Constantinople in the early fourth century, in comparison to those from other cities of the East.

Between 326 and 329, the city of Sparta dedicated a statue of the provincial governor Publilius Optatianus (signo Porfyrius) and placed it next to the image of Lycurgus, along the east parodos of the city's theater. As proconsul of Achaia, Optatianus had the privilege of appealing directly to the emperor and enjoyed the pleasures of the intellectual life of Athens, the historical monuments of Greece, and perhaps traditional cult. Optatianus was a Roman aristocrat and a poet and had exchanged letters with Constantine on literary matters in 312. He was later banished (apparently in 322/323), but perhaps thanks to a series of poems he sent to the emperor, he was recalled from exile (325/326) and advanced to prefect of the city of Rome (in 329 and 333). His post in Greece probably dated after his exile and before his prefecture. The local magistrate Marcus Aurelius Stephanus, who paid for the statue of Optatianus, is also the last recorded priest of the imperial cult in Achaia. Could Optatianus also be responsible for the statue of Helios in neighboring Gytheum? This is impossible to know. In the Spartan text, he is described as a

benefactor in all things and savior of Lacedaemon. In his praises to Constantine, Optatianus makes regular references to Apollo and the Heliconian Muses primarily in terms of literary allusions, that is, as gods of his poetic inspiration. At the same time, his collection includes clear references to Christianity. Regarding the protecting deity, he often refers to him as "the Highest God", but in a few cases the god Helios is mentioned in this function or in an allusion to Constantine's rulership. Along with these poetic allusions, in one of Optatianus's picture-poems dedicated to Constantine the enigmatic solar symbol we saw on the coin of Thessalonica appears once again. Although this evidence cannot be connected to the Gytheum head, it may reveal the attitude of a powerful imperial official who, as part of his conventus, must have visited Sparta and, probably on one of these occasions, was honored with a statue set up by the priest of the imperial cult next to that of the city's mythical law-giver.

Krallis has recently suggested that sections 2.22-28 of Zosimus New History, which refer to Constantine's war against Licinius, is modelled on the battles of Salamis and Hydapses and might come from the work of the Athenian historian Praxagoras. The assimilation of Constantine's victories to famous battles of the Greco-Persian Wars and the campaigns of Alexander by an Athenian historian possibly reveals how the Athenian intellectual elite tried to flatter the emperor by giving a Panhellenic, or Athenocentric, myth-historical version of Constantine's successful campaigns, casting his opponent as an oriental despot of some sort fighting against Hellas. This new reading also supports the view that the Serpent Column of Delphi in the hippodrome should primarily be seen as a trophy monument, which urged the viewer to compare the great moments of Hellas with Constantine's victories and, together with the Egyptian obelisks, reinforced the solar allusions of Constantine's image in the hippodrome. When Prohaeresius was called forward to praise Constans publicly in Athens with respect to the renewal of the grant of corn supply to the city, he cited Celeus, Triptolemus, and Demeter. So, a mythical king of Athens, Alexander, Apollo-Helios, and Zeus Eleutherius (who was traditionally associated with the imperial cult in Athens and the Panhellenic commemoration of the Persian Wars at Plataea) may all have been powerful comparisons to make for praising Constantine. Interestingly enough, when Himerius (315-386), a teacher of rhetoric in Athens, praised Constantius II on behalf of the city, he also used solar imagery and named the Sun as Constantius's II ancestor (προπάτωρ), thus revealing that Sol still offered an appropriate comparandum for the son of Constantine when an Athenian wished to praise him in 351. It is therefore possible to imagine that the head of Gytheum may have also been reconfigured several times in honor of different emperors in the course of the fourth century.

Conclusion

The Gytheum head belonged to a late antique sculptured monument representing Helios. The poor condition and technique of the work do not allow us to decide whether the sculptor had also intended to combine divine and imperial portrait iconography. Be that as it may, the image of Helios and his symbolism in the 320s provided a syncretistic blueprint for the glorification of Constantine that possibly aimed to reassure the pagan population of the recently conquered eastern territories in the face of Constantine's Christianity. Deprived of traditional worship, entailing sacrifice and idol veneration, but also accommodating an attempted de-paganized version of imperial cult, the solar imagery offered apolysemy that would cater to both pagans and Christians. I have argued that the Gytheum head could be read as a manifestation of loyalty and popular devotion towards Constantine, being expressed in a way that was not only in accord with the official image promoted at that time by the court, but also drew on traditional norms of honoring the emperor in the Greek East. Key elements of Constantine's negotiated conceptualization by the cities of Hellas would include the close association with the Sun god – the Supreme Deity and protector of the emperor – and the link between his recent military victories and classical Greek and Roman conceptions of the glorious past. If the Athenians liked to emphasize culture and letters, the Laonians prized more the god who was still most connected to the late Roman army. In all these time-tested strategies of praise, the people of Hellas were walking a well-trodden path, whose value an emperor like Constantine still knew how to appreciate.

Zosimus Book Two

THE longest period of the life of man is only equal to the intermediate space between these games. For an age, or the space of one hundred years, which we call *aivon*, is by the Romans called *seculum*. This is an excellent remedy for the plague, consumption and other diseases; of its origin receive this account. Valesus Valesius, from whom

descended the Valerian family, was a great man among the Sabines, before whose house was a grove of very lofty trees, which were burnt with lightning. He was thus induced to enquire the meaning of such a portent. His children, moreover, falling sick, he consulted both the physicians and the soothsayers. He was told by them, that by the manner of the fire falling the gods were angry; which caused Valesius wisely to attempt by sacrifices to appease them. He and his wife being terrified, and expecting every moment the death of their children, he prostrated himself before Vesta, and promised to offer up two entire souls instead of their children, which were his own and that of their mother. But turning to the grove that had been burnt, he seemed to hear a voice that commanded him to carry the children to Tarentum, and there to warm some |36 Tiber water over the fire of Pluto and Proserpine, and to give it to the children to drink. On hearing this he despaired the more of the recovery of the children. For Tarentum was at a great distance, and besides there was no Tiber water to be had there: and it caused him to entertain more desponding thoughts of it, that the voice had told him the water must be warmed on the altar of the infernal deities, at which the soothsayers themselves were also startled. However, having heard it the second time, he obeyed the command of the gods. Putting his children on board a small river-vessel, he carried the fire along with him. The children were ready to faint through heat, while he sailed to that part of the river where the stream is most gentle; and taking up his lodging at a shepherd's cottage, he heard a voice say that he must stay at Tarentum, for that was the name of the place, which had the same name with Tarentum near the Iapygian promontory; On which Valesius, having paid due adoration to the gods for his good fortune, ordered the pilot to put to shore, and, landing, told the whole story to the shepherds. Presently taking some water out of the Tiber, and heating it on an altar erected by himself, he gave it to his children to drink; as soon as they had drunk it they fell asleep and were perfectly cured. But in that sleep they fancied that they saw a vision, which told them to offer black victims to Pluto and Proserpine, and to spend three nights in singing and dancing; which dream they communicated to their father, and that it was a huge man of a godlike presence, who ordered them to do it in the Campus Martius, where the horse-races are held. Valesius, therefore, intending to build an altar in that place, set the masons to dig, who found an altar ready made, on which was inscribed. "To Pluto and Proserpine". By which being more plainly instructed how to act, he sacrificed the black victims on the altar, and kept the vigils in that place.

This same altar, and the manner of sacrificing on it, thus originated. The Romans and the Albans being at war, and both prepared for battle, a monstrous figure appeared, clothed in a black skin, and crying out, that Pluto and Proserpine commanded sacrifices to be made to them before they fought, it disappeared. On which, the Romans, who were terrified at the sight, made an altar underground, and when they had sacrificed on it, buried it at the depth of twenty feet., in order that it might not be found by any but themselves. Valesius having found it, according to command, sacrificed upon it, and kept the vigils; for which he was called Manius Valerius Tarentinus. For the Romans call the infernal gods Manes, and Valere signifies to be in good health; |37 and the surname of Tarentinus he derived from Tarentum where he sacrificed. Some time afterwards, when a plague happened in the city, which was the year after the expulsion of the kings, Publius Valerius Publicola sacrificed a black bull and a black heifer to Pluto and Proserpine, by which he freed the city from the disease. He wrote on the altar this inscription; "Publius Valerius Publicola dedicated fire to Pluto and Proserpine in the Campus Martius, and exhibited spectacles in honour of them, for the preservation of the Roman people."

But afterwards, when they were oppressed with diseases and wars, which was in the year 352 after the building of the city, the senate endeavoured to deliver themselves from those calamities by means of the oracles of the Sibyls, and therefore commanded those whose office it was to consult those oracles. Having so done they told the senate, that by sacrificing to Pluto and Proserpine an end would be put to all their miseries. They therefore chose a convenient place, which they consecrated to Pluto and Proserpine as they were commanded, when Marcus Potitus was in his fourth consulate. And when the ceremony was completed, being delivered from their grievances, they again laid aside the altar in some extremity of the Campus Martius. These rites were afterwards neglected for many years, until some misfortunes befell them, and then Octavianus Augustus renewed the games which had before been celebrated, when Lucius. Censorinus and Marcus Manlius Puelius were consuls. They were again used under the consulate of Lucius Censorinus and Caius Sabinus, when Ateius Capito had explained the laws concerning them, and the fifteen men who had the care of the books of the Sibyls had found out the time when the sacrifice ought to be performed and the games held. After Augustus was dead, these games were celebrated by

Claudius, without any regard to the due time. After him Domitian, who paid no regard to what Claudius had done, computed the years from the time when Augustus kept that festival, and seemed to observe their original institution. And after them Severus in the hundred and tenth year restored the same game, with his two sons Antoninus and Geta, when Chilo and Libo were consuls. This is said to be the manner in which these games were observed. The beadles went round at the time, and invited all the people to a spectacle, such as they had never witnessed and never would again. The Quindecimviri, in the summer season, a little before the games began, sat in the Capitol, and in the Palatine, temple, upon a tribunal, from which they distributed to the people a kind of purifying |38 preparations, called lustralia, which consisted of torches, brimstone and pitch, of which none but freemen are allowed to participate. And when the people assembled in the above mentioned places and in the temple of Diana, which is on mount Aventine, each person brought wheat, barley, and beans, and kept vigils to the fatal sisters. The time of the festival being arrived, which was celebrated three successive days and nights in the Campus Martins, the victims were consecrated near the bank of the Tiber at Tarentum. There they sacrificed to several deities; to Jupiter, Juno, Apollo, Latona, and to the Parcae, Lucinae, Ceres, Pluto, and Proserpine, which was performed in this order. The first night that the spectacles were exhibited, the emperor with the Quindecimviri sacrificed three lambs on as many altars purposely placed on the side of the river, where having sprinkled the altars with blood he offered up the victims whole. Then, having prepared a scene without a theatre, they placed a great number of lights, and made a large fire, by which they sang a new hymn, to render the games more solemn. They who performed these ceremonies were rewarded for their labour with the first fruits of their wheat, barley, and beans. For these were as I stated distributed among the people. The following day they went up to the Capitol, where the usual sacrifices were offered, and going from thence to the appointed place, celebrated games in honour of Apollo and Diana. On the next day, the principal ladies entered the Capitol at the hour appointed by the oracle, where they conducted themselves with due reverence: and at the third hour, in the temple of Apollo near the palace, twenty-seven children of each sex, whose parents were all living, sang hymns, and spoke in Greek and Latin; by which the Roman empire was preserved. Besides these, however, there were other rites observed by the divine command, which as long as they were kept up preserved the Roman empire. And in confirmation of what I have stated, I will add the oracle of the Sibyl, which has been mentioned by others before my time;

But when a hundred years and ten are past
Which is the longest time man's age doth last,
Romans! be sure (it is fatal to mistake
In any point) due offerings to make
To heaven, and see you bring the sacrifice
Into that field which on the Tiber lies:
And do it, in that season, when the night
Deprives men least of the diurnal light.
After sun set; Then to the Parcae pay
Your homage; and upon their altars lay |39
Young sheep and goats: next the Lucinae please
With decent rites, who childing women ease,
Those finished offer a black hog and sow
To Tellus, for the product of the plow,
But to Jove's altar bring the bulls milk-while
For victims, in the day-time, not by night:
(For heavenly deities accept of none
But what are offer'd in the day alone.)
And next to Juno sacrifice a cow
Spotless all o'er, and pure as fulling snow,
Then let Apollo, whom they call the sun,
And Phoebus, have his equal honours done.
Whilst in the temple Latin girls and boys
In sacred hymns make a triumphant noise.
But let them be apart, the girls to stand
And sing on this, the boys on t'other hand;
Besides this caution I must farther give
That all the parents of them be alive.
As for the married women, let them pray
To Juno on their knees, that each one may
Have their desire, both men and women too,

But chiefly women. Then, let all of you
Bring from your houses what is fit to bring,
(As the first-fruits of every useful thing)

To the immortal gods an offering.

And let all that upon your altars lie,
Whence you may men and women both supply.

But to attend the gods be sure there be
Both night and day a numerous company
Of votaries both serious and free.

These laws observ'd not Latium alone
But Italy's extent your sway shall own.

Experience assures us, that while these ceremonies were duly performed, according to the direction of the oracles, the empire was secure, and likely to retain its sovereignty over almost all the known world; and on the other hand, when they were neglected, about the time when Dioclesian laid down the imperial dignity, it fell to decay, and degenerated insensibly into barbarism. That I state nothing but truth I will prove from chronology. From the consulate of Chilo and Libo, in which Severus celebrated the secular games, or rites, to the ninth consulate of Dioclesian, and eighth of Maximianus, was a hundred and one years. Then Dioclesian from an emperor became a private individual, and Maximianus followed his example. But when Constantine and Licinius were in their third consulship, the 110 years were completed, and the festival ought to have been kept |40 according to custom; but it was neglected, and affairs consequently declined to their present unfortunate condition.

Three years after Dioclesian died, and the reigning emperors, Constantius and Maximianus Gallerius declared Severus and Maximinus (who was nephew to Gallerius), the Caesars, giving all Italy to Severus, and the eastern provinces to Maximinus. Affairs being all regulated and the barbarians quiet, since the Romans had been so successful against them, Constantine, who was the son of Constantius by a concubine, and had previously an ambition of being emperor (but was more inflamed with that desire, since Severus and Maximinus had acquired the name and honour of Caesars), was now resolved to leave the place where he had resided, and to go to his father Constantius, who was beyond the Alps, and generally in Britain. But being apprehensive of seizure by the way, many persons being well acquainted of his anxiety for dominion, he maimed all the horses that were kept for public service, whenever he came to any stable where they were kept, except what he took for his own use. He continued to do this throughout his journey, by which means he prevented those that pursued him from going further, while he himself proceeded toward the country where his father was.

It happened that Constantius died at that time; the guards, therefore, who thought none of his legitimate children to be fit for the imperial dignity, considered that Constantine was a person capable of sustaining it, and conferred the honour upon him, in hopes of being remunerated with handsome presents. When his effigy according to custom was exhibited at Rome, Maxentius, the son of Maximianus Herculus, could not endure the sight of Constantine's good fortune, who was the son of a harlot, while himself, who was the son of so great an emperor, remained at home in indolence, and his father's empire was enjoyed by others. He therefore associated with himself in the enterprise Marcellianus and Marcellus, two military tribunes, and Lucianus, who distributed the swine's flesh, with which the people of Rome were provided by the treasury, and the court-guards called Praetoriani. By them he was promoted to the imperial throne, having promised liberally to reward all that assisted him in it. For this purpose they first murdered Abellius, because he, being prefect of the city, opposed their enterprise.

Maximianus Gallerius, when he had learned this, sent Severus Caesar against Maxentius with an army. But while he advanced from Milan with several legions of Moors, Maxentius corrupted his troops with money, and even the prefect of the court, Anullinus, |41 and thereby conquered him with great ease. On which Severus fled to Ravenna, which is a strong and populous city, provided with necessaries sufficient for himself and soldiers. When Maximianus Herculus knew this, he was doubtless greatly concerned for his son Maxentius, and therefore, leaving Lucania where he then was, he went to Ravenna. Finding that Severus could not by any means be forced out of this city, it being well fortified, and stored with provisions, he deluded him with false oaths, and persuaded him to go to Rome. But on his way thither, coming to a place called the Three Tabernae, he was taken by a stratagem of Maxentius and immediately executed. Maximianus Gallerius could not patiently endure these injuries done to Severus, and therefore resolved to go from the east to Rome, and to punish,

68965 Maxentius as he deserved. On his arrival in Italy, he found the soldiers about him so treacherous, that he returned into the east without fighting a battle. At this period Maximianus Herculus, who lamented the tumults which disturbed the public peace, came to Dioclesian who then lived at Carnutum, a town of Gallia Celtica, and endeavoured to persuade him to resume the empire, and not to suffer the government which they had preserved so long and with so much difficulty to be exposed to the madness and folly of those who had possessed themselves of it, and who had already brought it near to ruin. But Dioclesian refused to listen to him; for he wisely preferred his own quiet, and perhaps foresaw the troubles that would ensue, being a man well versed in matters of religion. Herculus therefore, perceiving that he could not prevail with him, came to Ravenna, and so returned to the Alps to meet Constantine, who lay there. And being naturally a busy faithless man, he promised his daughter Fausta to Constantine, which he performed, but persuaded him to pursue Maximianus Gallerius, who was then leaving Italy, and to lay wait for Maxentius. To all which Constantine agreed. He then left him, designing if possible to recover the empire, as he hoped to create a quarrel between Constantine and his son Maxentius. But while he attempted these things, Maximianus Gallerius assumed Licinius, as his colleague in the empire, with whose assistance he hoped to cope with Maxentius. But while Gallerius deliberated on these affairs, he died of an incurable wound, and Licinius then also claimed the sole dominion. Maximianus Herculus endeavoured, as I have said, to recover the empire by alienating the soldiers from Maxentius. For which purpose, by gifts and insinuating addresses, having brought them over to him, |42 he endeavoured to form a conspiracy against Constantine, in which his soldiers were to join. But Fausta revealed it to Constantine, and Herculus, who was now overborne by so many disappointments, died of a distemper at Tarsus.

68990 Maxentius, having escaped this danger, and being of opinion that he was now well enough established in the empire, sent persons into Africa, and in particular to Carthage, to carry his image about that country. But the soldiers in that country forbade it, out of regard to Maximianus Gallerius, and the respect they had for his memory, until they heard that Maxentius was coming to make war on them on the plea of an insurrection. They then went to Alexandria, but meeting with a great army with which they were not able to contend, they returned to Carthage. Maxentius, being disturbed at this, resolved to sail for Africa, and to punish the authors of the commotion. But the soothsayers having sacrificed and given him ill omens, he was afraid to go, not only because the entrails had that appearance, but also lest Alexander, who was prefect of the court in Africa, should be his enemy. To secure his passage thither from all doubt, he sent to Alexander, desiring him to send his son as an hostage. But he, suspecting that Maxentius did not desire his son for the mere purpose of an hostage, but to deceive him, denied the request. After this, Maxentius sending other agents to him to take him off by treachery and stratagem, the plot was discovered; and the soldiers, having then got a favourable opportunity to rebel, conferred the purple robe on Alexander, though he was by birth not only a Phrygian, but a timid cowardly man, and unlit for any difficult undertaking, and was, moreover, of an advanced age.

69005 At that time a fire happened at Rome; whether it came out of the air or earth is uncertain. It broke out in the temple of Fortune; and while the people ran to extinguish it, a soldier, speaking blasphemy against the goddess, was killed by the mob out of zeal, by which a mutiny was occasioned among the soldiers. They would have destroyed the whole city, had not Maxentius soon appeased their rage. Maxentius after this sought every occasion to make war on Constantine, and pretending grief for his father's death, of which Constantine was the cause, he designed to go towards Rhaetia, which is contiguous both to Gaul and Illyricum. For he imagined that he should subdue Dalmatia and Illyricum, by the assistance of the generals in those parts, and of the army of Licinius. But thinking it better first to arrange affairs in Africa, he raised an army, bestowing the command of it on Rufius Volusianus, prefect of the court, and sent |43 them into Africa. He sent Zeno also along with Rufius, who was a person not only expert in military affairs, but esteemed for his courtesy and affability. On the first charge, Alexander's troops retired on a body of men in the rear, nor was the other party left unconquered by the enemy. Alexander himself was taken and strangled.

69025 The war being thus at an end, a good opportunity was afforded to sycophants and informers of impeaching all the persons in Africa, who had good estates, as friends to Alexander: nor were any of the accused spared, but some of them put to death, and others deprived of all their possessions. After this he triumphed at Rome for the mischief done at Carthage. Such was the state of the affairs of Maxentius, who conducted himself with cruelty and licentiousness towards all the inhabitants of

69030 Italy, and even to Rome itself. Meantime Constantine, who had long been jealous of
him, was then much more disposed to contention. Having therefore raised an army
amongst the Barbarians, Germans, and Celts, whom he had conquered, and likewise drawn
a force out of Britain, amounting in the whole to ninety thousand foot and eight
thousand horse, he marched from the Alps into Italy, passing those towns that
69035 surrendered without doing them any damage, but taking by storm those which resisted.
While he was making this progress, Maxentius had collected a much stronger army;
consisting of eighty thousand Romans and Italians, all the Tuscans on the sea coast,
forty thousand men from Carthage, besides what the Sicilians sent him; his whole
force amounting to a hundred and seventy thousand foot and eighteen thousand horse.
69040 Both being thus prepared, Maxentius threw a bridge over the Tiber, which was not of
one entire piece, but divided into two parts, the centre of the bridge being made to
fasten with irons, which might be drawn out upon occasion. He gave orders to the
workmen, that as soon as they saw the army of Constantine upon the juncture of the
bridge, they should draw out the iron fastenings, that the enemy who stood upon it
69045 might fall into the river.
Constantine, advancing with his army to Rome, encamped in a field before the city,
which was broad and therefore convenient for cavalry. Maxentius in the mean time shut
himself up within the walls, and sacrificed to the gods, and, moreover, consulted the
Sibylline oracles concerning the event of the war. Finding a prediction, that whoever
69050 designed any harm to the Romans should die a miserable death, he applied it to
himself, because he withstood those that came against Rome, and wished to take it.
His application indeed proved just. For when Maxentius drew out |44 his army before
the city, and was marching over the bridge that he himself had constructed, an
infinite number of owls flew down and covered the wall. When Constantine saw this, he
69055 ordered his men to stand to their arms. And the two armies being drawn up opposite to
each other, Constantine sent his cavalry against that of the enemy, whom they charged
with such impetuosity that they threw them into disorder. The signal being given to
the infantry, they likewise marched in good order towards the enemy. A furious battle
having commenced, the Romans themselves, and their foreign allies, were unwilling to
69060 risk their lives, as they wished for deliverance from the bitter tyranny with which
they were burdened; though the other troops were slain in great numbers, being either
trod to death by the horse, or killed by the foot.
As long as the cavalry kept their ground, Maxentius retained some hopes, but when
they gave way, he tied with the rest over the bridge into the city. The beams not
69065 being strong enough to bear so great a weight, they broke; and Maxentius, with the
others, was carried with the stream down the river.
When the news of this victory was reported in the city, none dared to shew any joy
for what had happened, because many thought it was an unfounded report. But when the
head of Maxentius was brought upon a spear, their fear and dejection were changed to
69070 joy and pleasure. On this occasion Constantine punished very few, and they were only
some few of the nearest friends of Maxentius; but he abolished the praetorian troops,
and destroyed the fortresses in which they used to reside. At length, having arranged
all things in the city, he went towards Gallia Celtica; and on his way sent for
Licinius to Milan, and gave him in marriage his sister Constantia, whom he had
69075 formerly promised him, when he wished him to unite with himself against Maxentius.
That solemnity over, Constantine proceeded towards the Celtae. It was not long before
a civil war broke out between Licinius and Maximianus, who had a severe engagement,
in which Licinius at first appeared to have the disadvantage, but he presently
rallied and put Maximianus to flight. This emperor, travelling through the east into
69080 Egypt, in hopes of raising a force to renew the war, died at Tarsus.
The empire being thus devolved on Constantine and Licinius, they soon quarrelled. Not
because Licinius gave any cause for it, but that Constantine, in his usual manner,
was unfaithful to his agreement, by endeavouring to alienate from Licinius some
nations that belonged to his dominions. By this means an open rupture ensued, and
69085 both prepared for war. Licinius |45 took up his head-quarters at Cibalis, a city of
Pannonia, which stands on a hill; the road to which is rugged and narrow. The
greatest part of this road is through a deep morass, and the remainder up a mountain,
on which stands the city. Below it extends a spacious plain, which entertains the
view with a boundless prospect. On this Licinius fixed his camp, and extended the
69090 body of his army under the hill, that his flanks might be protected from the enemy.
Constantine in the meantime drew up his men near the mountain, placing the horse in
front, thinking that to be the best disposition lest the enemy should fall upon the
foot, who moved but slowly, and hinder their advance. Having done this, he
immediately gave the charge, and attacked the enemy. This engagement was one of the
69095 most furious that was ever fought; for when each side had expended their darts, they

fought a long time with spears and javelins; and after the action had continued from morning to night, the right wing, where Constantine himself commanded, began to prevail. The enemy being routed, Licinius's troops, seeing him mounted and ready to fly, dared not stay to eat their portions, but left behind them all their cattle and provisions, taking only as much food as would suffice for one night, and marched with great precipitation along with Licinius to Sirmium, a city of Pannonia, by which runs a river which discharges itself into the Ister. In passing this town he broke down the bridge over the river, and marched on with an intention to levy troops in Thrace. Constantine, having taken Cibalis, and Sirmium, and all the towns that Licinius had abandoned, sent five thousand men in pursuit of him. But as these were ignorant of the course he had taken, they could not overtake him. Constantine however, having rebuilt the bridge over the Saus, which Licinius had broken down, was with his army almost at his heels. Having entered Thrace, he arrived at the plain where Licinius lay encamped. On the night of his arrival there he marshalled his army, and gave orders for his soldiers to be ready for battle by day-break. As soon as it was light, Licinius, perceiving Constantine with his army, drew up his forces also, having been joined by Valens, whom he styled Caesar, after the battle of Cibalis. When the armies engaged, they first fought with bows at a distance; but when their arrows were spent, they began to use their javelins, and poignards. Thus the battle continued very obstinately for a considerable time, until those whom Constantine had sent in pursuit of Licinius descended from an eminence upon the armies while they were engaged. These wheeled round the hill ¹⁴⁶ before they arrived at them, deeming it best to join their own party from the higher ground, and to encompass the enemy. The troops of Licinius, being aware of them, courageously withstood against them all, so that many thousands were slain on both sides, and the advantage was equal, till the signal was given for both to retire. Next day they agreed on a truce, and entered into an alliance with each other, on condition that Constantine should possess Illyricum and all the nations westward, and that Licinius should have Thrace and the east; but that Valens, whom Licinius had made Caesar, should be put to death, because he was said to be the author of all the mischief which had happened. Having done this, and sworn on both sides to observe the conditions, Constantine conferred the rank and title of Caesar on Crispus, his son by a concubine called Minervina, who was as yet but a youth, and on Constantine, who was born but a few days before at Arelatum. At the same time Licinianus, the son of Licinius, who was twenty months of age, was declared Caesar, Thus ended the second war.

Constantine hearing that the Sauromatae, who dwelt near the Palus Maeotis, had passed the Ister in boats, and pillaged his territories, led his army against them, and was met by the barbarians, under their king Rausimodus. The Sauromatae attacked a town which was sufficiently garrisoned, but its wall was built in the lower part of stone, and in the upper part of wood. They therefore thought that they might easily take the town by burning all the wooden part of the wall; and with that view set it on fire, and in the mean time shot at those who stood on the walls. The defenders threw down darts and stones upon the barbarians, and killed many of them; and Constantine then coming up and falling on them from a higher ground, slew a great number, took some alive, and put the rest to flight. Rausimodus, having lost the greater part of his army, took shipping and crossed the Ister, with an intention of once more plundering the Roman dominions. Constantine, hearing of his design, followed them over the Ister, and attacked them in a thick wood upon a hill, to which they had fled, where he killed many of them, amongst whom was Rausimodus. He also took many of them prisoners, giving quarter to those that would submit; and returned to his headquarters with an immense number of captives. These he distributed into the different cities, and then came to Thessalonica, where having constructed a harbour (this city not possessing one before), he made new preparations for war against Licinius. For this purpose, he fitted out two hundred galleys of war; each with thirty oars, ¹⁴⁷ besides two thousand transport vessels, and raised a force of a hundred and twenty thousand foot, and ten thousand horsemen and sailors. Licinius, hearing of the great preparations of Constantine, sent messengers to every nation, commanding them to prepare a sufficient number of men for the navy, besides horse and foot soldiers. The Egyptians therefore sent out eighty galleys, the Phoenicians an equal number, the Ionians and Dorians of Asia sixty, the Cyprians thirty, the Carians twenty, the Bithynians thirty, and the Africans fifty. His foot-soldiers amounted to nearly a hundred and fifty thousand, but his horse only to fifteen thousand, which were sent to him from Phrygia and Cappadocia. Constantine's navy lay at Piraeus, that of Licinius in the Hellespont. When they had thus established their naval and military forces, Licinius encamped at Adrianople in Thrace, whilst Constantine sent for his navy from Piraeus, which was built and manned chiefly in Greece. Advancing with his

infantry from Thessalonica, he encamped on the bank of the river Hebrus, which runs to the left of Adrianople. At the same time, Licinius drew up his army in order of battle, extending from a mountain which is above the town two hundred stadia, as far as the junction of another river with the Hebrus; thus the armies continued opposite to each other for several days. Constantine. observing where the river was least broad, concerted this plan. He ordered his men to bring trees from the mountain, and to tie ropes around them, as if he intended to throw a bridge over the river for the passage of his army. By this stratagem he deluded the enemy, and, ascending a hill on which were thick woods sufficient to conceal any that were in them, he planted there five thousand archers and eight hundred horse. Having done this, he crossed the Hebrus at the narrowest place, and so surprised the enemy that many fled with all their speed, while others, who were amazed at his unexpected approach, were struck with wonder at his coming over so suddenly. In the meantime, the rest of his army crossed the river in security, and a great slaughter commenced. Nearly thirty thousand fell; and about sunset Constantine took their camp, while Licinius, with all the forces he could muster, hastened through Thrace to his ships. As soon as day appeared, the whole army of Licinius, or as many of them as had fled to the neighbouring mountains and vallies, together with those that Licinius through haste had left behind him, surrendered themselves to Constantine. Licinius being arrived at Byzantium, Constantine followed and besieged him in that city. His navy, as before related, had now left Piraeus and lay at Macedon. He therefore sent orders to his admirals to bring the ships into the Hellespont. This being effected according to the command of Constantine, the officers of his navy thought it not prudent to engage with more than eighty of their best sailing vessels, which were gallies of thirty oars each, because the place was too narrow for the reception of a greater number. Upon which Abantus, the admiral of Licinius, making use of two hundred ships, despised the smallness of the enemy's fleet, which he thought he could easily surround. But the signals on both sides being given, and the vessels meeting stern to stern, the seamen of Constantine managed their ships so as to engage in good order; but the ships of Abantus, sailing against the enemy without any order, and being confined by the narrowness of the place, became exposed to the enemy, who sunk and otherwise destroyed them. Many were thrown overboard; till at length night put an end to the engagement. The fleets then separated and put in at different places, the one at Eleus in Thrace, and the other at the Aeantian harbour. The following day, the wind blowing hard from the north, Abantus put out from the Aeantian port and prepared for action. But the galleys of fifty oars being come to Eleus by order of the admirals, Abantus was alarmed at the number of vessels, and hesitated whether to sail against the enemy. About noon the north wind subsided; the south wind then blew with such violence, that the ships of Licinius, which lay on the Asiatic coast, were some driven on shore, others broken against the rocks, and others foundered with all on board. In this affair five thousand men perished, together with a hundred and thirty ships filled with men, whom Licinius had sent out of Thrace to Asia accompanied by a part of his army; Byzantium being too small to contain all that were besieged with Licinius. The sea-fight being thus concluded, Abantus effected his escape with only four ships into Asia. The navy of Constantine, having arrived in the Hellespont laden with abundance of provisions and stores for his troops, weighed anchor in order to join in the siege of Byzantium, and to blockade the city by sea. The foot-soldiers of Licinius, being alarmed at the sight of such a navy, procured ships in which they sailed to Eleus.

Meantime Constantine continued intent upon the siege, and raised a mound of equal height, with the wall, on which he placed wooden towers that overlooked the wall, from which his soldiers shot: those who defended it, in order that he might with greater security bring battering rams and other engines of war near it. By these means he thought himself sure to take the city. At which Licinius, being terrified, and not knowing how to act, resolved to leave Byzantium, and the weaker part of his army therein, and to take with him only such men as were fit for active service, and had given proofs of their attachment to himself, and to hasten without delay to Chalcedon in Bithynia. He flattered himself that another army might be raised in Asia, which would enable him again to contend with his adversary. Arriving therefore at Chalcedon, and, having appointed Martinianus to the command of the court guards, whom the Romans call Magister officiorum, his associate in this dangerous enterprize, he declared him Caesar, and sent him with an army to Lampsacus, to hinder the passage of the enemy from Thrace into the Hellespont. He posted his own men on the hills and passes about Chalcedon.

While Licinius was thus occupied, Constantine, who had a great number of transports as well as warlike vessels, and was desirous to make use of them in crossing over and

possessing himself of the opposite shore, fearing that the Bithynian coast might be inaccessible to ships of burden, immediately constructed some small vessels, with
69230 which he sailed to the sacred promontory, which lies at the entrance of the Pontus, two hundred stadia from Chalcedon. He there landed his army, which, having done, he drew them up upon some adjacent hills. Licinius, though he then saw that Bithynia was already in the hands of his enemy, was rendered so desperate by danger, that he sent for Martinianus from Lampsacus, and in order to encourage his men to fight, told them
69235 that he himself would lead them. Having said what he thought necessary to encourage them, he drew them up in order of battle, and marching out of the city, met the enemy, who were prepared for him. A sharp engagement taking place between Chalcedon and the sacred promontory, Constantine had the superiority; for he fell on the enemy with such resolution, that of a hundred and thirty thousand men, scarcely thirty
69240 thousand escaped. When the Byzantines heard of this, they immediately threw open their gates to Constantine, as did the Chalcedonians also. Licinius after this defeat went to Nicomedia with what horse were left him, and a few thousands of foot. At this time a Persian named Hormisdas, of the royal family, came over to Constantine for refuge, under these circumstances. His father had been king of Persia. He was
69245 once celebrating his own birth-day after the Persian manner, when Hormisdas entered the palace, bringing with him a large quantity of venison. But as the guests at the table did not rise, and pay him the respect and honour due to him, he became enraged, and told them he would |50 punish them with the death of Marsyas. This saying most of them did not understand, because it related to a foreign story; but one of them, who
69250 had lived in Phrygia, and had heard the story of Marsyas, explained to them the meaning of Hormisdas's menace, while they sat at table. It was therefore so treasured up in their recollection, that when his father died, they remembered his threat, and chose his younger brother king, though according to law the elder should be preferred above the other children. Not contented with that, they put Hormisdas in chains, and
69255 confined him on a hill which lies before their city. But after some time had elapsed, his wife effected his escape in this manner. She procured a large fish, and put a file in its belly, and, sewing it up again, delivered it to the most trusty of her eunuchs, charging him to tell Hormisdas, that he must eat the fish when no one was present, and use what he should find in its belly for his escape. When she had formed
69260 this contrivance, she sent several camels loaded with wine, and abundance of meat, to entertain her husband's keepers. While they were enjoying the feast she gave them, Hormisdas cut open the fish, and found the file; having with that filed off the shackles from his legs, he put on the robe of the eunuch, and passed through the midst of his keepers, who were by that time perfectly intoxicated. Taking one of the
69265 eunuchs along with him, he fled to the king of Armenia, who was his particular friend. By these means he got safe to Constantine, who shewed him all possible kindness and respect. But Licinius being besieged by Constantine at Nicomedia also, knew not what to do, being sensible that he had not an army equal to engage. Going, therefore, out of the
69270 city, he submitted himself to Constantine, and brought him the purple robe, proclaiming him his emperor and lord, and intreating pardon for what was past. He presumed that he certainly should escape with life, because Constantine had sworn to his wife that he would spare him. But Constantine delivered Martinianus to the guards that they might put him to death, and sent Licinius to Thessalonica, as if he were to live there in security. However, he afterwards broke his oath, |1 which was usual with Constantine, and caused him to be executed. |51
Now that the whole empire had fallen into the hands of Constantine, he no longer concealed his evil disposition and vicious inclinations, but acted as he pleased, without controul. He indeed used the ancient worship of his country 2; though not so
69280 much out of honour or veneration as of necessity. Therefore he believed the soothsayers, who were expert in their art, as men who predicted the truth concerning all the great actions which he ever performed. But when he came to Rome, he was filled with pride and arrogance. He resolved to begin his impious actions at home. For he put to death his son Crispus, stiled (as I mentioned) Caesar, on suspicion of
69285 debauching his mother-in-law Fausta, without any regard to the ties of nature. And when his own mother Helena expressed much sorrow for this atrocity, lamenting the young man's death with great bitterness, Constantine under pretence of comforting her, applied a remedy worse than the disease. For causing a bath to be heated to an extraordinary degree, he shut up Fausta in it, and a short time after took her out
69290 dead. Of which his conscience accusing him, as also of violating his oath, he went to the priests to be purified from his crimes. But they told him, that there was no kind of lustration that was sufficient to clear him of such enormities. A Spaniard, named Aegyptius, very familiar with the court-ladies, being at Rome, happened to fall into

69295 converse with Constantine, and assured him, that the Christian doctrine would teach him how to cleanse himself from all his offences, and that they who received it were immediately absolved from all their sins. Constantine had no sooner heard this than he easily believed what was told him, and forsaking the rites of his country, received those which Aegyptius offered him; and for the first instance of his impiety, suspected the truth of divination. For since many fortunate occurrences had
69300 been thereby predicted to him, and really had happened according to such prediction, he was afraid that others might be told something which should fall out to his misfortune; and for that reason applied himself to the abolishing of the practice. And on a particular festival, when the army was to go up to the Capitol, he very indecently reproached the solemnity, and treading the holy ceremonies, as it
69305 were, under his feet, incurred the hatred of the senate and people 3. Being unable to endure the curses of almost the whole city, he sought for another city as large as Rome, where he might build himself a palace. Having, therefore, discovered a convenient scite between Troas and old Ilium, he there accordingly laid a foundation, and built part of a wall to a considerable height, which may still be
69310 seen by any that sail towards the Hellespont. Afterwards changing his purpose, he left his work unfinished, and went to Byzantium, where he admired the situation of the place, and therefore resolved, when he had considerably enlarged it, to make it a residence worthy of an emperor. The city stands on a rising ground, which is part of the isthmus inclosed on each side by the Ceras and Propontis, two arms of the sea. It
69315 had formerly a gate, at the end of the porticos, which the emperor Sevtrus built after he was reconciled to the Byzantines, who had provoked his resentment by admitting his enemy Niger into their city. At that time the wall reached down from the west side of the hill at the temple of Venus to the sea side, opposite to Chrysopolis. On the north side of the hill it reached to the dock, and beyond that to
69320 the shore, which lies opposite the passage into the Euxine sea. This narrow neck of land, between there and the Pontus, is nearly three hundred stadia in length. This was the extent of the old city. Constantine built a circular market-place where the old gate had stood, and surrounded it with double roofed porticos, erecting two great arches of Praeconnesian marble against each other, through which was a passage into
69325 the porticos of Severus, and out of the old city. Intending to increase the magnitude of the city, he surrounded it. with a wall which was fifteen stadia beyond the former, and inclosed all the isthmus from sea to sea. Having thus enlarged the city, he built a palace little inferior to that of Rome, and very much embellished the hippodrome, or horse-course, taking into it the temple of Castor and Pollux, whose
69330 statues are still standing in the porticos of the hippodrome. He placed on one side of it the tripod that belonged to the Delphian Apollo, on which stood an image of the deity. 153 As there was at Byzantium a very large market-place, consisting of four porticos, at the end of one of them, to which a numerous flight of steps ascends, he erected two temples; in one of which was placed the statue of Rhea, the mother of the
69335 gods, which Jason's companions had formerly fixed on Mount Dindymus, which is near the city of Cyzicus. It is said, that through his contempt of religion he impaired this statue by taking away the lions that were on each side, and, changing the position of the hands. For it formerly rested each hand on a lion, but was now altered into a supplicating posture, looking towards the city, and seeming to observe
69340 what the people were doing. In the other temple he placed the statue of the Fortune of Rome. He afterwards built convenient dwellings for the senators who followed him from Rome. He engaged in no more wars; and even when the Thaifalians, a Scythian tribe, made an incursion into his dominions, he not only neglected to lead his army against them, but after he had lost most of his troops, and saw the enemy plundering
69345 all before them, even to his very intrenchments, was contented to save himself by flight. When he was delivered from the distractions of war, he yielded himself to voluptuousness, and distributed to the people of Byzantium a present of corn, which is continued to this day. As he expended the public treasure in unnecessary and
69350 unprofitable buildings, he likewise built some which in a short time were taken down again, because being erected hastily they could not stand long. He likewise made a great change in the ancient magistracy. Till that time there had been only two prefects of the court, whose authority was equal; not only were the court soldiers under their controul, but those also which guarded the city, and who were stationed
69355 in its neighbourhood. The person who had the office of prefect of the court, which was esteemed the next post of honour to that of emperor, distributed the gifts of corn, and punished all offences against military discipline, as he thought convenient. Constantine altered this good institution, and of one office or magistracy formed four. To one of those prefects he committed all Egypt and

- 69360 Pentapolis in Libya, and all the east as far as Mesopotamia, with Cilicia, Cappadocia, Armenia, and all the coast from Pamphylia to Trapezus and the castles near Phasis; to the same person was given all Thrace and Moesia, as far as the mountains Haemus and Rhodope, and the town of Doberus. He likewise added Cyprus and
- 69365 all the Cyclades, except Lemnos, Imbrus, and Samothracia. To another he assigned Macedon, Thessaly, Crete, and Greece, with the adjacent islands, 154 both the Epiruses, the Illyrians, the Dacians, the Triballi, and the Pannonians as far as Valeria, besides the upper Moesia. To the third prefect he entrusted Italy and Sicily, with the neighbouring islands, and Sardinia and Corsica, together with all Africa westward of the Syrtes. To the fourth he committed all beyond the Alps, Gaul, Spain, and Britain. Having thus divided the power of these prefects, he invented
- 69370 other methods likewise of diminishing their influence. For as there used to be in all places, centurions, tribunes, and generals, he appointed officers called Magistri militum, some over the horse and others over the foot, to whom he gave authority to discipline the soldiers, and punish those that had offended, by which the power of the prefects was diminished. That this innovation was productive of great injury to
- 69375 public affairs both in peace and war I will immediately prove 4. The prefects had hitherto collected the tribute in all places by their officers, and disposed of it in war expences, the soldiers at the same time being subject to their authority, whose offences they punished at discretion. Under these circumstances, the soldiers, considering that the same person who gave them their pay had the infliction of
- 69380 punishments whenever they offended, did not dare to act contrary to their duty, for fear of their stipend being withheld, and of being duly punished. But now since one person is paymaster and another inspector of discipline, they act according to their own inclination.
- 69385 Constantine likewise adopted another measure, which gave the Barbarians free access into the Roman dominions. For the Roman empire, as I have related, was, by the care of Dioclesian, protected on its remote frontiers by towns and fortresses, in which soldiers were placed; it. was consequently impossible for the Barbarians to pass them, there being always a sufficient force to oppose their inroads. But Constantine
- 69390 destroyed that security by removing the greater part of the soldiers from those barriers of 155 the frontiers, and placing them in towns that had no need of defenders; thus depriving those who were exposed to the Barbarians of all defence, and oppressing the towns that were quiet with so great a multitude of soldiers, that many of them were totally forsaken by the inhabitants. He likewise rendered his
- 69395 soldiers effeminate by accustoming them to public spectacles and pleasures. To speak in plain terms, he was the first cause of the affairs of the empire declining to their present miserable state.
- However, I must not omit to relate, that having given to his three sons, Constantine, Constantius, and Constans, the title of Caesars, he so greatly enlarged the city of
- 69400 Constantinople, that many of the succeeding emperors, who made it their residence, drew to it too great a number of inhabitants, who flocked there from all parts, as soldiers, merchants, and in other occupations. On this account, its walls were rendered more capacious than those which Constantine built, and the buildings were permitted to be placed so near to each other, that the inhabitants are exposed to
- 69405 much inconvenience and danger both in their houses and in the streets. Besides this a considerable portion of the sea was added to the land by driving down piles, thus forming dry ground, on which was built a sufficient number of houses to form of themselves a considerable city.
- I have, indeed, often wondered, since the city of Byzantium is become so great that
- 69410 no other is equal to it either in felicity or magnitude, that our ancestors had not any prophecy concerning its good fortune. Having directed my thoughts some time to this enquiry, I consulted many historians and collections of oracles, and at length, after much difficulty and taking great pains to interpret them, discovered an oracle, which is attributed to Sibylla Erythraea, or Phaello of Epirus. Nicomedes the son of
- 69415 Prusias relying upon this, and interpreting it to his own advantage, by the counsel of Attalus made war upon his father. The oracle I speak of is this:
- Thou among sheep, O King of Thrace, shalt dwell,
But breed a savage lion, fierce and fell,
Who all the product of thy land shall spoil,
And reap thy fruitful harvest without toil.
But thou shalt not enjoy thy honour long,
Torn by wild dogs, which shall about thee throng.
Then a fierce, hungry, sleeping wolf shall thou
Awake, to whom thy conquered neck shall bow.
Next a whole herd of wolves Bithynia's land,
- 69420
- 69425

By Jove's decree shall ravage, and the hand
 To which obedience the Byzantines yield
 Shall in short time her royal sceptre wield. |56
 Bless'd Hellespont! whose buildings by the hand

Of heaven were rais'd, and by its order stand.

Yet shall that cruel wolf my forces fear,
 For all shall know me, who inhabit here.

My sire's designs no longer I'll conceal
 But heaven's intent in oracles reveal.

Thrace shall e're long a monstrous birth produce,
 Baneful to all by course of time and use:

A swelling ulcer by the sea shall grow,

Which when it breaks, with putrid gore shall flow.

This oracle, in an obscure manner, points out all the particular evils that were to befall Bythynia through the heavy impositions laid upon it; and that the government was to devolve on those to whom the Byzantines were then subject, in this distich:

————— and the hand

To which obedience the Byzantines yield

Shall in short time her royal sceptre wield.

And though the events foretold did not occur until many ages afterwards, no one can suppose that the prophecy related to any other place; for all time is short in respect of the deity, who exists through all ages. This conjecture I have formed both from the words of the prophecy and from the event. Should any believe that this prophecy has a different import, they have liberty to enjoy their own opinion.

Constantine, having done this, not only continued to waste the revenue of the empire in useless expences, and in presents to mean and worthless persons, but oppressed those who paid the tributes, and enriched those that were useless to the state. For he mistook prodigality for magnificence 5. He also laid a tax of gold and silver on all merchants and tradesmen, even to the lowest classes, nor did he even spare the poorest prostitute 6. Thus, on the return of every fourth year, when the tax was to be paid, nothing could be heard through the whole city but lamentations and

complaints. When the time arrived |57 nothing but whips and tortures, provided for those who on account of their extreme poverty could not pay the money. Mothers were even forced to part with their children, and fathers to prostitute their daughters, for money to satisfy the collectors of this exaction. Wishing likewise to invent some trouble for the rich, he summoned them all and made them praetors, for which dignity he demanded a sum of money. Upon this account when they who had the management of this affair arrived in any city the people fled into other countries, in the fear of gaining this honour with the loss of all they possessed. He had the schedules of all the best estates, and imposed a tribute on each of them, which he called a purse. With these exactions he exhausted all the towns; for they continued in force so long even after the time of Constantine, that the cities were completely drained of money, and many of them forsaken by their inhabitants.

After Constantine had oppressed and tormented the people in these various modes, he died of a disease, and was succeeded by his three sons, who were not born of Fausta the daughter of Maximianus Herculus, but of another woman, whom he had put to death for adultery. They devoted themselves more to the pleasures of youth than to the service of the state. They began by dividing the nations between them. Constantine the eldest, and Constans the youngest, having for their share all beyond the Alps, together with Italy and Illyricum, the countries bordering on the Euxine sea and all that belonged to Carthage in Africa; Constantius obtained all Asia, the east, and Egypt. There were likewise others who shared in the government; Dalmatius, whom Constantine made Caesar, Constantius his brother, and Anaballianus, who had all worn robes of purple embroidered with gold, and were promoted to the order of

Nobilissimates by Constantine, from respect to their being of his own family. The empire being thus divided, Constantius who appeared to take pains not to fall short of his father in impiety, began by shedding the blood of his nearest relations. He first caused Constantius, his father's brother, to be murdered by the soldiers; next to whom he treated Dalmatius in the same manner, as also Optatus whom

Constantine had raised to the rank of a Nobilissimate. Constantine indeed first introduced that order, and made a law, that every Nobilissimate should have precedence over of the prefects of the court. At that time, Ablabius prefect of the court was also put to death; and fate was just in his punishment, because he had concerted the murder of Sopatrus the philosopher, from envy of his familiarity with Constantine. Being unnatural |58 towards all his relations, he included Anaballianus with the rest, suborning the soldiers to cry out, that they would have no governors

but the children of Constantine. Such were the exploits of Constantius.

In the mean time Constantine and Constans were disputing for that part of Africa which belonged to Carthage, and for Italy. Constans, who wished to surprise, his
69495 brother, concealed his enmity for three years. He took occasion, when he was in a province that was attached to himself, to send soldiers to him, on pretence of assisting him in the war against the Persians, but in reality to assassinate him by surprise. This they accordingly performed. Such was the end of Constantine. Constans, having thus removed his brother, exercised every species of cruelty toward
69500 his subjects, exceeding the most intolerable tyranny. He purchased some well favoured Barbarians, and had others with him as hostages, to whom he gave liberty to harrass his subjects as they pleased, in order to gratify his vicious disposition. In this manner he reduced all the nations that were subject to him to extreme misery. This gave uneasiness to the court guards, who perceiving that he was much addicted to
69505 hunting placed themselves under the conduct of Marcellinus prefect of the treasury, and Magnentius who commanded the Joviani and Herculiani (two legions so termed), and formed a plot against him in the following manner. Marcellinus reported that he meant to keep the birth-day of his sons, and invited many of the superior officers to a feast. Amongst the rest Magnentius rose from table and left the room; he presently
69510 returned, and as it were in a drama stood before thorn clothed in an imperial robe. Upon this all the guests saluted him with the title of king, and the inhabitants of Augustodunum, where it was done, concurred in the same sentiment. This transaction being rumoured abroad, the country people flocked into the city; while at the same time a party of Illyrian cavalry who came to supply the Celtic legions, joined
69515 themselves with those that were concerned in the enterprize. When the officers of the army were met together, and heard the leaders of the conspiracy proclaim their new emperor, they scarcely knew the meaning of it; they all, however, joined in the acclamation, and saluted Magnentius with the appellation of Augustus. When this became known to Constans, he endeavoured to escape to a small town called Helena, which lies near the Pyrenean mountains. He was taken by Gaision, who was sent with
69520 some other select persons for that purpose, and being destitute of all aid, was killed. Magnentius thus gained the empire, and possessed himself all [59] the nations beyond the Alps, and the whole of Italy. Vetrano, general of the Pannonian army, upon hearing of the good fortune of Magnentius, was himself inflamed with the same
69525 desire, and was declared emperor by the legions that were with him, at Mursa, a city of Pannonia. While affairs were thus situated, the Persians plundered the eastern countries, particularly Mesopotamia. But Constantine, though he was defeated by the Persians, yet resolved to subdue the factions of Magnentius and Vetrano. While he was forming these resolutions, and was very intent on warlike preparations,
69530 Magnentius still remaining in Gallia Celtica, Nepotianus, nephew to Constantius, by his sister Eutropia, collected a band of persons addicted to robbery and all kinds of debauchery, with whom he came to Rome, and appeared in an imperial dress. Anicetius, whom Magnentius had made prefect of the court, armed some of the common people, and led them out of the city to engage with Nepotianus. A sharp conflict ensued between
69535 them. The Romans being undisciplined, and observing no order, were easily routed; and when the prefect saw them fly, he shut the gates, for fear the enemy should follow them into the city. The troops of Nepotianus pursued them, and as they had no way of escape, killed every man. In a few days after, Magnentius sent an army under the command of Marcellinus, and Nepotianus was put to death.
69540 Meantime Constantius advanced from the east against Magnentius, but deemed it best first to win over Vetrano to his interest, as it was difficult to oppose two rebels at once. On the other hand, Magnentius used great endeavours to make Vetrano his friend, and thus to put an end to the war against Constantius. Both therefore sent agents to Vetrano, who chose to adopt the friendship of Constantius rather than that
69545 of Magnentius. The ambassadors of Magnentius returned without effecting their purpose. Constantius desired that both armies might join, to undertake the war against Magnentius. To which proposal Vetrano readily assented; and they seated themselves on a throne provided for the occasion. Constantius, speaking first according to his dignity, endeavoured to remind the soldiers of his father's
69550 munificence, and of the oaths they had taken to be true to his children. He then told them, that they ought not to suffer Magnentius to go unpunished, who had murdered the son of Constantine, with whom they had fought many battles, and had been generously remunerated. When the soldiers heard this, having been previously corrupted by valuable presents, they cried out, that they would have no mock emperors, and
69555 immediately began to strip the purple from Vetrano, and pulled him from the throne [60] with the determination to reduce him to a private station. Constantius would not suffer them to injure him, and therefore sent him into Bithynia, where he allowed him

a competency for life. He had not remained there long without employment before he died.

69560 Constantius, having so well succeeded in his design against Vetranio, marched against Magnentius, having first conferred the title of Caesar on Gallus, the son of his uncle, and brother to Julian who was afterwards emperor, and given him in marriage his sister Constantia; either in order that he might oppose the Persians, or as seems more probable, that he might have an opportunity of taking him off. He and his
69565 brothers were the only remaining persons of the family whom Constantius had not put to death, as I have related. When he had clothed Gallus with the Caesarean robe, and appointed Lucilianus general in the Persian war, he marched towards Magnentius with his own troops and those of Vetranio in one body. Magnentius, on the other hand, resolved to meet him with a larger force. He declared his kinsman Caesar, and
69570 appointed him to govern the nations beyond the Alps. The armies meeting in Pannonia, and coming near to each other at a town called Mursa, Magnentius placed an ambuscade in the defiles near to Adrana, and sent a messenger to the officers of the army of Constantine to retard their march, saying, that they might proceed to Siscia, where he intended to give them battle, the fields in that neighbourhood being spacious and
69575 open. When Constantius heard this, he was much pleased that he was to fight in a place where there was room for the cavalry to manoeuvre, being superior to the enemy in that kind of force. He accordingly led his army to Siscia. As they were marching unarmed and without order, not suspecting any thing, the troops that lay in ambush attacked them, and blocked up their passage with stones, which they threw upon them
69580 in such quantities that great part of them were killed. Magnentius, perceiving that many of his enemies were thus slain, was so elated, that being now unwilling to defer the war, he mustered his forces, and immediately marched towards Pannonia. Arriving in the plain before Cius, through the midst of which runs the river Draus, which, passing by Noricum and Pannonia, discharges itself into the
69585 Ister, he led his troops into Pannonia, intending to engage near Sirmium. His mother is said to have enjoined him not to go that way, or over into Illyricum, but he disregarded her injunctions, though on many former occasions he had found her a true prophetess. Meantime he deliberated whether to construct a bridge over the Saus, or to pass over on |61 boats joined together for that purpose. At the same time,
69590 Constantius sent one of the principal persons in his service, named Philip, a man of extraordinary prudence, under pretence of treating for peace and an alliance, but in reality to observe the state and disposition of the army of Magnentius, and to discover their intended movements. Approaching the camp, he met Marcellinus, the principal confidant of Magnentius, and by him was conducted to Magnentius. The army
69595 being drawn up, Philip was desired to explain the cause of his coming. Upon which he directed himself to the soldiers, telling them, that it did not. become them, who were Roman subjects, to make war on Romans, especially as the emperor was the son of Constantine, with whom they had erected many trophies over the Barbarians. That
69600 Magnentius, moreover, ought to remember Constantine, and the kindness he had shewn to him and to his parents. That it was Constantine who had protected him when in imminent danger, and exalted him to the highest dignities. Having made these observations, he requested Magnentius to depart from Italy, and to be content with the government of the nations beyond the Alps. This speech of Philip nearly occasioned a mutiny of the whole army. Magnentius,
69605 therefore, being alarmed, with much difficulty prevailed on the soldiers to attend to him. He said, that he likewise was desirous of concluding a peace, but would then dismiss the assembly, until he had deliberated how to act. Upon which, the assembly being dissolved, Marcellianus entertained Philip as one whom he was desirous of obliging by the laws of hospitality. Meanwhile, Magnentius debated with himself,
69610 whether to dismiss Philip without the purpose of his embassy being effected, or, in violation of the law of nations, detain him. He determined, after much hesitation, to invite all the officers of his army to sup with him, and at table inform them of his opinion. The following day he again convened the army; he reminded them of the injuries they received from Constans when furious and intoxicated. That the soldiers
69615 could not sustain the enormities with which he oppressed the state contrary to all law and justice, but had inclined to what was most for the public advantage; and that after they had freed the cities from so savage a monster, they had compelled him to become their emperor. He had scarcely concluded this address, when they all rose, and displayed their
69620 willingness to continue the war by arming themselves immediately, in order to cross the Saus. The centinels who were on the watch in Siscia, a town that lies on the Saus, perceived their approach, and gave notice of it, to the garrison, who shot some of them as they were landing on the bank of |62 the river, and stopped others who

were coming over; so that many of them were slain, hut more pushed into the river, either by each other or by the enemy. By which means a great slaughter was made amongst them, and while one party fell from the bridge in their haste to escape, the other pursued with the greatest speed: so that Magnentius, who was reduced to his last device, had only one method of avoiding the present danger. He struck a spear into the ground, and beckoned with his right hand to the enemy as if he wished to treat for peace. When he saw that they attended to this, he said he would not pass the Saus without the emperor's permission. As soon as he had said this, Philip told him, that if he would treat for peace, he must leave Italy and Noricum, and go into Illyricum. Constantius, having heard what was said, commanded his soldiers to continue their pursuit no longer, and permitted Magnentius to bring his troops into the plains between Noricum, Pannonia, Moesia, and Dacia; having a wish to leave those rugged places, and to contend where his horse would have room to manoeuvre, for in that species of force he had the advantage of the enemy. His design succeeded; and he appointed Cibalis which he thought a convenient place for his purpose; it being the place where Constantine conquered Licinius. In that town, which is situated as I have described in my narrative of those times, he kept part of his army. And having erected a bulwark between the hill on which the town stands, and the plain through which the river Saus flows, he inclosed all that part of it which is not encompassed by the river, with a deep ditch and a strong rampart. He then made a bridge of boats over that part of the river which surrounds the place, which bridge he could disjoin when he pleased, and put together again with the same ease. Here he placed tents for his army, and in the midst of them a royal tent of exceeding magnificence. The emperor then invited his officers to a banquet, at which all except Latinus and Thalassius were present. These were absent, though they were the greatest favourites of the emperor, because they were officiating for Philip, who was detained by Magnentius, notwithstanding his being an ambassador.

While they were consulting about this affair, Titianus, a man of the senatorian order at Rome, came with an insolent message from Magnentius. He employed ninny absurd expressions against Constantine and his children, charging the destruction of the cities on the emperor's negligence, and commanded Constantius to make way for Magnentius by abdicating the empire, and to be contented with his life being granted him. But |63 the emperor only desired the gods and fate to be the avengers of Constans, saying that he would fight with their assistance. He suffered Titianus to return to Magnentius, though Philip still remained in his custody. Magnentius now drew out his army, and taking Siscia on the first assault, razed it to the ground. Having overrun all the country near the Saus, and acquired great plunder, he marched towards Sirmium, which he hoped likewise to take without bloodshed. But failing in his attempt, being repulsed by the inhabitants and the troops that defended the town, he marched with his whole army to Mursa. Finding that those in the town had shut the gates against him and mounted the walls, he was at a loss how to act on the occasion, having no engines nor any other method of getting near the wall. He was assailed with stones and darts by those that stood on the battlements. When Constantius heard that the place was besieged, he marched with all his forces to its relief, having passed by Cibalis and all the country through which the river Draus passes.

Meanwhile Magnentius approached nearer to Mursa, and set fire to the gates, thinking if he could destroy the iron that covered the wood, which would soon yield to the flames, he might make a passage wide enough for the entrance of his army into the city. But this did not succeed to his wishes, the people on the wall extinguishing the flames with water which they poured down in large quantities. When he therefore heard that Constantius was near Mursa, he invented another stratagem to this effect. There was before the city a stadium or place of exercise, formerly used by those that fought for prizes, which was covered over with wood. In this he concealed four companies of Celtae, with orders when Constantius should come up, and they were ready to engage before the city, to attack the enemy by surprise, and to surround them and kill every man. This being discovered by those that were on the walls, Constantius immediately sent thither Scolidoas and Manadus, two of his officers. They first selected the choicest of their men, both heavy armed and archers, and taking them along with themselves, fastened up all the doors of the stadium. Having then possessed themselves of the upper steps leading into the; Stadium, and inclosed the soldiers that were within on all sides, they threw darts at them. And observing some of them with their shields placed over their heads attempting to force open the doors, they fell upon them and did not cease throwing darts or cutting at them with their swords until they had killed them all. This project of Magnentius being thus frustrated, the armies met and engaged in the plain before Mursa; |64 where such a battle was fought as had not occurred before in the course of this war, and great

69690 numbers fell on both sides.
 Constantius, considering that as this was a civil war victory itself would be
 scarcely an advantage to him, now the Romans being so much weakened, as to be totally
 unable to resist the barbarians who attacked them on every side, began to think that
 it would be better to end the war by offering proposals for peace. While he was thus
 69695 deliberating, the armies were still engaged; and that of Magnentius became more
 furious, nor would they cease fighting though night came on, but even their officers
 continued performing what belonged to common soldiers, and encouraging their men to
 oppose the enemy with vigour. On the other side likewise, the officers of Constantius
 called to mind the ancient bravery and renown of the Romans. Thus the battle
 69700 continued until it was completely dark; nor did even darkness cause them to relax;
 but they wounded each other with spears, swords or whatever was in their reach; so
 that neither night nor any other obstacle which usually causes some respite in war,
 could put an end to the slaughter, as if they thought it the greatest felicity that
 could happen to them to perish beside each other. Amongst the officers, that shewed
 69705 great bravery in this battle and fell in it were Arcadius, commander of the legion
 called Abulci, and Menelaus, who commanded the Armenian horse archers. What is said
 of Menelaus is worthy of being related. He could take three darts at once, and with
 one shot hit three men, by which manner of shooting he killed a great, number of the
 enemy, and was himself almost the cause of their flight. He was killed by Romulus,
 69710 who was the first in command in the army of Magnentius, and Romulus himself fell at
 the same time. He was wounded by a dart which Menelaus had thrown at him, yet
 continued fighting after he had received the wound, until he had killed the person
 who had given it to him.
 Constantius now gaining the victory, by the army of Magnentius taking to flight, a
 69715 terrible slaughter ensued. Magnentius, therefore being deprived of all hope, and
 apprehensive lest the remnant of his army should deliver him to Constantius, deemed
 it best to retire from Pannonia, and to enter Italy, in order to raise an army there
 for another attempt. But when he heard that the people of Rome were in favour of
 Constantius, either from hatred to himself, or because they had heard of the event of
 69720 the battle, he resolved to cross the Alps, and .seek for himself a refuge among the
 nations on that side. Hearing however that Constantius had likewise engaged the
 Barbarians near the Rhine against him, and that |65 he could not enter Gaul, as some
 officers had obstructed his passage thither in order to make their court to
 Constantius, nor through Spain into Mauritania, on account of the Roman allies there
 69725 who studied to please Constantius. In these circumstances he preferred a voluntary
 death to a dishonourable life, and chose rather to die by his own hand than by that
 of his enemy.
 Thus died Magnentius, having been emperor three years and six months. He was of
 Barbarian extraction, but lived among the Leti, a people of Gaul. He understood
 69730 Latin, was bold when favoured by fortune, but cowardly in adversity, ingenious in
 concealing his natural evil disposition, and deemed by those who did not know him to
 be a man of candour and goodness. I have thought it just to make these observations
 concerning Magnentius, that the world may be acquainted With his true character,
 since it has been the opinion of some that he performed much good, who never in his
 69735 life did any thing with a good intention.
 Decentius, whom Magnentius had called to his assistance, being now on the road to
 Italy, soon heard of the misfortune, of Magnentius; meeting with some legions and
 troops from which he saw no hope of escaping, slew himself. After these occurrences,
 the whole empire being now in the hands of Constantius, he began to be more arrogant
 69740 than before, and could not conduct himself with any moderation in his prosperity. The
 state-informers, with which such men are usually surrounded, and which are designed
 for the ruin of those that are in prosperity, were augmented. These sycophants, when
 they attempted to effect the downfall of a noble in hopes of sharing his wealth or
 honours, contrived some false accusation against him. This was the practice in the
 69745 time of Constantius. Spies of this description, who made the eunuchs of the court
 their accomplices, flocked about Constantius, and persuaded him that his cousin
 german Gallus, who was a Caesar, was not satisfied with that honour, but wished to be
 emperor. They so far convinced him of the truth of this charge, that they made him
 resolve upon the destruction of Gallus. The contrivers of this design were Dynamius
 69750 and Picentius, men of obscure condition, who endeavoured to raise themselves by such
 evil practises. Lampadius also, the Prefect of the court, was in the conspiracy,
 being a person who wished to engross more of the emperor's favour than any other.
 Constantius listened to those false insinuations, and Gallus was sent for, knowing
 nothing of what was intended against him. Assoon as he arrived, Constantius first
 69755 degraded him from the dignity of Caesar, and, having reduced him to private station,

delivered him to the public |66 executioners to be put to death. This was not the first time that Constantius imbrued his hands in the blood of his relations, but only one other in addition to many former.

69760 [Footnotes moved to end]

1. * If what others say of Constantine, be true, Zosimus has no reason to impute to him the crime of perjury; for he did not seem so much to break an oath or promise, as to punish the violation of it in Licinius, who, after Constantine had gained so many victories, when he was reduced to a very low condition, omitted no opportunity of recovering the empire, of which he had been deprived by the just sentence of victory, but contrived all methods of making ill returns for the kindness of Euergetes; Euseb, Life of Constantine, l. i. c. 43. and Theodor, l. i. c. 7. To which this may likewise be added, that Licinius hated the christians as much as Constantine esteemed them, who consequently could not endure to see those exposed to injury whom he favoured. Nor should any one object, that these authors are not to be credited, because they were partial; since Zosimus himself cannot be excused in that particular, being an inveterate enemy to Christianity, and a violent bigot to the heathenish superstition.

69765 2. * Among the Imperial laws or edicts, is one which Eusebius mentions, l. x. c. 5. "That every one may apply himself to that mode of worship he thinks suitable to his own reason." And therefore, though he did not abolish the old heathen institutions of his country at that: 69775 time, yet he favoured the Christians most, and gave them liberty, of which almost all the former emperors used to deprive them.

3. * It is almost needless to say, that all that is here related of Constantine is the slander of Julian the Apostate, and is totally without any foundation in truth. Crispus was justly executed for an atrocious crime, and Fausta perished by an accidental suffocation by the fault 69780 of the bath keepers.

4. * Zosimus throws the odium of the insensible decay by which the Roman empire fell to ruin upon Constantine; but he ought to have more cautiously weighed his arguments, and have reflected how ready those persons, who have gained the highest office under their sovereign, are to use all their endeavours to acquire the attachment of the soldiers, and from the hope 69785 of becoming emperors themselves, to throw every thing into confusion. Indeed when both the care of military discipline, and the distribution of the public money are committed to the same individual, it is probable that he will take some opportunity of acquiring the empire to himself, having every thing in his power which can influence the soldiers with the hope of reward and dread of punishment. Constantine therefore wisely adopted that political maxim, 69790 Divide and Rule.

5. * We must admit that Constantine was extravagant in his expences, whence Julian took occasion to ridicule him in his book called Caesares, where he introduces Mercury asking Constantine, "What do you think a commendable action?" Constantine replies, "For a man who possesses much to give much away."

6. + See Evagrius Hist. Eccl. l. iii. c. 39, where he commends Anastasius, in whose reign this tax was taken off. But he inveighs against Zosimus for saying that Constantine was the author of it in these words, "Who would wonder that this should be done in the very infancy of christianity, since his holiness the Pope suffers the same things now it has attained riper 69795 years."

Historical lectures

I – ROMANI, ROMANIA.

69805 The inhabitants of Rome have always called themselves Romani in their own language. This word is formed from the name Roma and the suffix -ano, one of those by which the Latin language derived the name of a country or city from the name of its inhabitants. Long after the subjugation of Italy and the other provinces that made up their empire, the Romani distinguished themselves from the peoples who lived under their domination. The latter retained their original names: they were Sabines, Gauls, Hellenes, Iberians, and did not have the right to call themselves Romans, a name reserved for those who held the right of citizenship by birth or who had received it by special favor. This distinction gradually faded, especially after the famous edict of Caracalla had made Roman citizens of all the inhabitants of the empire: In orbe Romano qui sunt, says Ulpian, ex constitutione imperatoris Antonini cives Romani effecti sunt. The threatening proximity of the Barbarians, who pressed the empire from several sides, soon made the use of the word Romani more general to designate the inhabitants of the empire as opposed to the thousand foreign peoples who bordered it and who were already beginning to cross its borders. The writers of the 4th and 5th centuries speak with pride of this new Roman nationality, of this fusion of races in a single homeland. Quis jam cognoscit, says Saint Augustine, gentes in imperio Romano quæ quid erant, quando omnes Romani facti sunt et omnes Romani dicuntur? It was when speaking of the empire that Apollinaris Sidonius wrote: In qua unica totius orbis civitate soli Barbari et servi peregrinantur. The poets did not fail to celebrate this great work. The verses of Rutilius Namatianus are famous:

Fecisti patriam diversis gentibus unam;
Urbem fecisti quæ prius orbis erat.

Those of Claudien, no less enthusiastic, seem to place particular emphasis on the name, which has become common, of Romani:

69830 Hæc est (Roma) in gremium victos quæ sola recepit,
 Humanumque genus communi nomine fecit.

Prudence also exclaims:

Deus undique gentes
Inclinare caput docuit sub legibus iisdem,
69835 Romanosque omnes fieri, quos Rhenus et Ister,
 Quos Tagus aurifluus, quos magnus inundat Iberus...
 Jus fecit commune pares et nomine eodem
 Nexuit et domitos fraterna in vincla redegit.

69840 How exaggerated these praises were, how far the entire human race had come from having entered the orbis Romanus, is what the authors of these verses themselves witnessed: the universal city was destroyed at the very moment when its completion was being celebrated, and the distinction between Romans and Barbarians, instead of expressing a relationship of superiority of the former over the latter, soon took on the opposite meaning. This distinction, which predates the establishment of the Germans in the Roman provinces of the West, persisted after this establishment; it was the same in all the countries where it took place. The foreign invaders were designated by the generic name of Barbari; they accepted it themselves[11], and did not find it wrong that the Romans, whom they charged with writing their laws and ordinances in Latin, attributed it to them. However, this name only appears in an exceptional way, and usually when it is a question of designating the whole of the Germanic tribes. These tribes had no common name at that time by which they could express their collective nationality; the word Germani, naturally, is completely unknown at that time; as for the word theodisc, diustisc (formerly French tiedeis, Italian tedesco), it does not appear in the Latin form theotiscus theudiscus until the 9th century; The word Teuto, which seems to be etymologically linked to it, is nowhere to be seen, and the derivative Teutonicus, used by certain Latin writers, is a classical memory which certainly did not rest, at that time, on any real denomination. It is permissible to doubt that the Germans had, at that time, a very clear awareness of their racial unity; in the texts they usually qualify themselves by the special name of their tribe, and we see the Romani successively opposed to the Franci, the Burgundiones, the Gothi, the Langobardi, etc. On the contrary, nowhere do we see the inhabitants of the provinces of the empire having special denominations which connect them to a nationality prior to the Roman conquest. In the whole of the laws and histories of that time there are neither Galli, nor Rhæti, nor Itali, nor Iberi, nor Afri: there are only Romani facing the conquerors spread throughout all the provinces. The Romanus is therefore, at the time of the Germanic invasions and

establishments, the inhabitant, speaking Latin, of any part of the empire. This is how he calls himself, not without retaining for a long time some pride in this great name[12]; but his conquerors do not call him thus: the name Romanus does not seem to have penetrated any of their dialects. The name that they give him and that they gave him probably well before the conquest, it is that of *walah*, later *welch*, *ags. vealh*, *anc. nor. vali* (Swedish mod. *val*), to which are attached the derivatives *walahisc*, later *waelsch* (*welche*) and *wallon*. The use of this word and that of *Romanus* is precisely inverse: the first is never used except by the Barbarians, the second only by the Romans[13]; both persisted face to face, as we will see below, well after the period in question here, in countries where the two races, Germanic and Latin, were in intimate and daily contact and had not managed to merge into a new nationality. The word *welche* has in French a contemptuous nuance which it certainly had, at that time, in the minds of the Germans who pronounced it. The conquerors had a high opinion of themselves and regarded themselves as very superior to the peoples among whom they came to settle. Purely Germanic monuments are unfortunately lacking for these remote periods; but a few Latin texts have preserved the memory of the feelings that the conquering race, still several centuries after the fall of the empire, entertained for the *Walahan*, the sole custodians of Western civilization. The most curious of these texts, because of its naivety, is this sentence which is found in the famous Roman-German glossary of Cassel and which is certainly by a Bavarian of the time of Pepin: *Stulti sunt Romani, sapienti Paioari; modica sapientia est in Romanis; plus habent stultitia quam sapientia*. Here, by a rare piece of luck, we have preserved, alongside the Latin translation, the thought of this excellent *Peigir* in the very form in which it smiled on his mind: *Tole sint Walha, spahe sint Peigira; luzic ist spahi in Walhum; mera hapent tolaheiti denne spahi*. At the same time, we encountered, on the banks of the Rhine, Germans like the one painted by Wandelbert in his account of the miracles of Saint Goar: *Omnes Romanæ nationis ac linguæ homines ita quodam gentilicio odio exsecrabatur ut ne videre quidem eorum aliquem æquanmitem vellet... Tanta enim ejus animum innata ex feritate barbarica stoliditas apprehenderat ut ne in transitu quidem Romanæ linguæ vel gentis homines et ipsos quoque bonos viros ac nobiles libenter adspicere posset*. These feelings were not limited to men without culture: even in the 10th century, Luitprand was indignant at the thought that he could be honored by calling him *Romanus*, and said to the Greeks: *Quos (Romanos) nos, Langobardi scilicet, Saxones, Franci, Lotharingi, Bagoarii, Sueri, Burgundiones, tanto dedignamur, ut inimico nostro commoti nil aliud contumeliarum nisi: Romane! dicamus, hoc solo nomine quidquid ignobilitatis, quidquid timiditatis, quidquid avaritiæ, quidquid luxuriæ, quidquid mendacii, imo quidquid vitiorum est comprehendentes*. How can we fail to notice that, after ten centuries, almost similar assessments of "*wælschen Lug und Trug*," "*wælsche Sittenlosigkeit*," and "*the deep moral understanding of the Romanischen Voelker*" are still heard in German? The name *Romani* did not persist beyond Carolingian times. The fusion of the Germanic conquerors with the Romans, their adoption of the language of the vanquished in Spain, France, and Italy, caused such a general distinction to disappear from the former Western Empire, replaced by the special names of the nations that arose from the debris of Charlemagne's empire. Soon there were no longer Romans in opposition to a certain number of conquering tribes, but on the contrary a German nation enclosed within the enlarged limits of ancient Germany, and which, while remaining divided into tribes, became aware of itself under the name of *Tiedesc*, and was called by its neighbors by various names, but also collective ones,—and, alongside it, *Lombards*, *French*, *Provençals*, *Flemings*, etc. The name *Romani* was maintained, however, in two cases, where the peoples who had shared it with the inhabitants of the entire empire did not find themselves included in any new nationality and retained, to distinguish themselves from the Barbarians who surrounded them, the old appellation of which they were proud. The Germans, faithful for their part to the previous tradition, called these peoples by the name of *Walahan*, *Welches*, and this name has remained with them to this day. These two cases occur in countries where the *Romani* population, due to special circumstances, lives in a sort of island among other races. Everyone now knows of the existence of the very interesting language spoken in the canton of *Grisons*, and which is distinct from the Italian with which it is in contact to the south. This language is the only vestige that has persisted to the present day of the language formerly spoken by the *Romani* of *Rhaetia*. It was long believed that the Roman inhabitants of this country had all emigrated to Italy, as *Eugippius* relates in the life of Saint Severin, and had left the place free for the Barbarians. But numerous and interesting documents prove that long after the definitive conquest of the country by the *Alemanni* and the *Bavarians*, a Roman population remained in the country in more or less numerous and substantial groups... There is therefore nothing

surprising in the fact that the non-Germanized inhabitants of the Chur region, the only ones who have resisted the progress of Teutonicism to this day, have kept, at least in part, their name as well as their language. It is true that they currently call themselves not Romaun, which among them means "Roman," but Romaunsch, like their idiom itself; but this derived form necessarily relies on the other, older one.—Just as they called themselves Romaunsch, the Germans now designate them by the derivative of Walah, namely Wælschen, Churwælschen. The other example of the persistence of the name Romani is found in countries that were part of the Eastern Empire. The peoples who, today, in the Danubian provinces, Hungary and European Turkey, speak a Latin idiom designate themselves by the name Romans (Rumën, Rumen, Romăn), which we have recently also given them (Romanians). The designation of Vlachs is applied to them only by the foreigners who surround them... —Like the Romani of the West, those of the East received the name Walahen from the Germans. It is true that at present they are not in contact with the Germans, but we know that these countries were those through which the first Germanic invasions rushed upon the empire: they had moreover been preceded by numerous colonizations. There, as everywhere, the Germans called those who called themselves Romani Walahen, and they transmitted this designation to the various peoples who replaced them in these regions; the Greeks themselves subsequently adopted it (Βλάχοι). Both names, the first in the mouths of foreigners, the second in that of the Romani, designate to this day the singularly scattered descendants of the ancient Romanized populations of these provinces. We know that they have also retained their language, and that, however altered and impregnated with foreign elements it may be, it deserves its place among the modern dialects where the Latin language still lives.

The name Romani, it is understood, did not designate the inhabitants of the empire who spoke Latin solely in opposition to the Germanic barbarians. They also used it to distinguish themselves from their other neighbors: only the corresponding appellation of Walahen is naturally lacking here. In Africa, for example, the Romani, whom we find called by this name at the approach of the Vandals, previously called themselves this in contrast to the natives who remained foreign to Roman domination or the Roman language. Similarly, when Armorica was occupied by Celtic-speaking tribes, the newcomers, no doubt continuing the custom they already had in Great Britain, called their neighbors, the inhabitants of the Romanized Gallic provinces, Romani. It follows from all that has just been said that the inhabitants of the Roman Empire, whatever their original nationality, designated themselves, particularly in contrast to foreigners and especially to the Germans, by the name of Romani. This name remained with them in the various countries where the invaders settled, as long as a distinction remained between the conquerors and the vanquished. In the West, it generally disappeared around the 9th century to make way for the names of the various nationalities that emerged from the dislocation of the empire by the Germanic tribes; It persisted, however, for a longer time, and still exists at least through its derivative in the small country of Chur. In the East, it continued to designate the Romanized inhabitants of the provinces south of the Danube who did not merge with the Illyrian, Greek, Germanic, Slavic, or Mongol populations, and it still designates them to this day. The word Romanus was translated into German as Walah, but the Romani never took this name themselves; it was maintained in German (where Romanus is unknown) to designate the Roman peoples during the Middle Ages, and has not yet completely disappeared: it is particularly attached to the two peoples who have kept the name Romani, the Churwælschen and the Walachen.

From the name of the inhabitants of the empire, a name for the empire itself was made. It was in the popular spirit to substitute a short and concrete designation for the terms imperium Romanum, orbis Romanus. From Romanus came the name Romania, formed by analogy from Gallia, Græcia, Britannia, etc. The advent of this name indicates in a striking way the moment when the fusion was complete between the very diverse peoples subjugated by Rome, and when all, recognizing themselves as members of a single nation, opposed themselves as a whole to the infinite variety of the Barbarians who surrounded them. This name was popular and had no right of entry in the classical style; thus the period in which it appears to us for the first time is obviously much later than that in which it must have been formed; the texts that give it use it solely in opposition to the barbarian world which had become the object of all fears, the threat constantly present in the mind.

Romania had barely become aware of itself that it was going to be ruined, at least in its material existence. This melancholy reflection is naturally suggested by the following passage, where we find the oldest example of the word. It was at the beginning of the 5th century that the following conversation took place, in the cave of Bethlehem where Saint Jerome lived, which focused on the Gothic king Ataulf, who

70000 had become an ally of the empire after having thought of destroying it completely: "Ego ipse, says Paul Orose, virum quemdam Narbonnensem, illustris sub Theodosio militiæ, etiam religiosum prudentemque et gravem, apud Bethlehem oppidum Palæstinæ beatissimo Hieronymo presbytero referentem audivi se familiarissimum Ataulpho apud Narbonam Fuisse, ac de eo sæpe sub testificatione didicisse quod ille, cum esset

70005 animo viribus ingenioque nimius, referre solitus esset se in primis ardentè inhiasse ut, oblitterato Romano nomine, Romanum omne solum Gothorum imperium and faceret et vocaret, essetque, ut vulgariter loquar, Gothia quod Romania fuisset."—At about the same time, we find this word in even sadder circumstances. The other great Christian

70010 doctor of this time, Saint Augustine, besieged in Hippo by the Vandals, receives letters from the bishops of the province asking him for advice on what they should do in the face of common peril and disaster, and he answers them on the conduct to adopt in the face of those whom his biographer Possidius, then imprisoned with him, calls illos Romanæ eversores. Romania does not only mean here, as the Bollandists want, ditio romana in Africa; it no longer even simply has the sense of Romanum imperium

70015 that Du Cange gives it; it has taken on a more general meaning, that of the Roman world, of Roman civilization opposed to the Barbarism that will destroy it. By a singular chance, the examples of the word Romania are older and more numerous in Greek than in Latin. When the capital of the empire was moved to Byzantium, it nevertheless remained the Roman Empire; Constantinople was called New Rome or simply

70020 Rome, and the Latin language remained the official language for a long time[14]. Greek writers seem to have adopted at this time the name Romania to designate the whole empire... Saint Athanasius says expressly: Μητροπόλις ἡ 'Ρώμη τῆς 'Ρωμανίας... Later, when the Eastern Empire was destroyed, the name 'Ρωμανία designated, in Greek writers, the empire of Byzantium, and reappeared under the form Romania (with the

70025 accent on the i), Romania, in Western writers, with this special meaning. It is from there that it came to designate the possessions of the Greeks in Asia, then the provinces which today form European Turkey and Greece, and where it must be recognized under the form Rumelia. I need not dwell here on the history of the Greek word 'Ρωμανία'; it suffices to show that it comes from Latin and that its widespread

70030 use in the East in the fourth century proves that it was popular in the West before that time. In the West, the word Romania, as we have seen, was primarily used to characterize the Roman Empire in opposition to the Barbarians, and later to express the entirety of Roman civilization and society. In this broad sense, it naturally includes

70035 language, and this secondary idea is clearly indicated in the verses in which Fortunatus, addressing the Frank Charibert, says to him:
Hinc cui Barbaries, illinc Romania plaudit.
Diversis linguis laus sonat una viro.

70040 Romania here means the entirety of the Romani, Roman society, the Roman world in opposition to the German or barbarian world.

The expression Romania remained in use until the Carolingian times and even probably took on a new vogue when Charlemagne had restored the Roman Empire. In a capitulary of Louis the Pious and Lothair, we read: "Præcipimus de his fratribus qui in nostris

70045 et Romanæ finibus paternæ seu maternæ succedunt hereditati," and it seems to me probable that Romania here signifies the extent of the empire rather than Italy or that Italian province to which the name ended up being restricted. But when the empire had passed to the kings of Germany, the word Romania seems to have designated specifically that part of their States which was not Germanic, namely Italy...

70050 Finally the name Romania ended up no longer designating anything but the province which still bears the name of Romagna and which corresponds to the ancient exarchate of Ravenna; It comes, according to some, from the famous donation made by Pepin to the Ecclesia Romana, according to others, from the name of the Greek empire, of [Greek: Rhōmania 'Ρῥάνιά], of which this province was the last possession in the

70055 West. In summary, the word Romania, made to embrace under a common name the whole of the possessions of the Romans, served particularly to designate the Western Empire, when it was detached from that of Constantinople (which, for its part, took the name of [Greek: Rhōmania 'Ρῥωμανία]). Since the successive destruction of all the remains of

70060 Roman domination, it has expressed the whole of the countries which were inhabited by the Romani, as well as the group of men still speaking the language of Rome, and consequently Roman civilization itself. In this sense, Romania is a well-chosen word to describe the domain of Romance languages and literatures. Romania, from this point of view of civilization and language, formerly included, at its greatest extent, the

70065 Roman Empire up to the limits where the Hellenic and Oriental world began, that is to

say, present-day Italy, the part of Germany situated south of the Danube, the provinces between this river and Greece, and, on the left bank, Dacia; Gaul up to the Rhine, England up to the wall of Septimius Severus; the whole of Spain, less the Basque provinces, and the northern coast of Africa. Large parts of this vast territory were taken from it, especially by the Germans. It is true that several of the formerly Roman countries where German is now spoken were never completely Romanized. For England, the fact is certain: when the Roman legions had withdrawn, the native Celtic element soon regained the preponderance, and the Romani who, despite everything, were still there in large numbers, were probably absorbed as much by the Bretons as by the Saxons.—The countries situated on the left bank of the Rhine which were Germanized were not all at the same time; they owe their Germanization either to the depopulation caused by the threatening proximity of the Barbarians (Rhine provinces, Alsace-Lorraine), or to the extermination of the Roman inhabitants by the invaders (Flanders). But it is certain, particularly for Alsace, that the Germanic establishment had been preceded by an almost complete Romanization.—The countries on the right bank of the Danube (Rhaetia, Noricum, Pannonia) had received early Germanic colonies established by the emperors themselves; In the face of the invasions, part of the Roman population went to Italy, the rest was absorbed more or less slowly into the conquering people; a small nucleus persisted in some valleys of the Alps.—In the more eastern provinces, the indigenous element had maintained itself as in England; but the Roman population had taken on more consistency there, so that in the midst of the old inhabitants (Albanians) and the masses of successive invaders (Germans, Slavs, Hungarians, Turks), the Romanians succeeded in maintaining themselves, on the one hand as a considerable body of population, on the other hand in small, very numerous scattered groups, and even managed to reoccupy Trajan's Dacia, which Aurelian had evacuated all the Romani from the 3rd century.—In Africa, it was not the Vandals who put an end to Romanism; On the contrary, it seems probable that, there as in Spain and Gaul, the Germans ended up merging with the vanquished, and a particular Romance language would doubtless have formed in the kingdom of Genseric, if the Vandal establishment had not been destroyed by the Greeks, and especially if the disastrous invasion of the Muslims had not torn these beautiful regions from the Christian world. It is likely that when the Arabs arrived, there were still many Romans in the country; However, the indigenous element had never disappeared, even during the time of Roman domination and in the heart of the provinces which it surrounded on all sides: it allied itself closely with the Arabs, and the last vestiges of Romanism disappeared very quickly from Africa. — Spain, on the contrary, where the fusion of the Goths with the Romans was complete, preserved its character, even under Arab domination, and finally succeeded in freeing itself from it entirely. — It was the same in Sicily: there, Romanism not only completely drove out the Arab element, but also caused the disappearance of the Greek element which, without doubt, was still quite abundant there at the beginning of the Middle Ages. — This Greek element also disappeared from the south of Italy, where it had remained since the Hellenic colonization; in the south of Gaul, it had been absorbed very early into Roman civilization. Romania, however, lost in Gaul a province that had certainly belonged to it, the peninsula to which the colonists coming from the other side of the Channel gave the name of Brittany; but there can be no doubt that this province, at the time of their landing, was almost completely depopulated. The losses that Romania suffered fourteen centuries ago are not without compensation. Not only did it absorb all the Germanic tribes that penetrated into the heart of its territory, but it also fell back from either side of the borders that the era of invasions had given it. At almost all the points where it found itself in contact with the German element, in Flanders, Lorraine, Switzerland, Tyrol, Friuli, it made a forward movement which gave it back a more or less large part of its former territory. In England, the Romanized Normans reconquered the country for centuries for the Romance world, and their language only yielded to that of the Saxons by mixing with it in such a proportion that the study of the English language and literature is inseparable from that of the Romance languages and literatures. I have already spoken of the suppression of Greek in Italy, of Dacia reconquered by the Romanians. In the new world, Romania annexed immense territories; it is beginning to regain possession of a part of North Africa. Latin, in its various popular dialects—which are the Romance languages—is spoken today by a much greater number of people than at the time of the empire's greatest splendor... G. Paris, in Romania, Vol. I (1872), passim.

II — THE GALLO-ROMAN VILLA.

It is plausible to conjecture that, in Gaul, before Caesar's conquest, the dominant system was that of large landownership. The Romans did not have to introduce into

this country either the right of property or the system of large estates cultivated by a servile population.

70135 In any case, we find in Gaul during the time of the Empire the same rural customs as in Italy. Tacitus speaks of an estate belonging to the Gaul Cruptorix, and he calls it a villa. Perhaps the most novel thing was that each villa took its own name, following Roman custom. In accordance with this same custom, the names of estates were most often taken from men's names. Ausonius mentions the Villa Pauliacus and the Villa Lucaniacus. Sidonius Apollinaris, in his letters, often has occasion to mention his properties or those of his friends. He owns one called Avitacus. An estate of the Syagria family is called Taionnacus; that of Consentius, a friend of Sidonius, is called ager Octavianus. Later, charters written in Gaul will show us a series of estates which all have a proper name; they are called, for example, Albinicus, 70140 Solemniacensis, Floriacus, Bertiniacus, Latiniacus, Victoriacus, Pauliacus, Juliacus, Atiniacus, Cassiacus, Gaviniacus, Clipiatus; there are several hundred of this kind[15]. These names, which we find in charters of the 7th century, certainly come from an earlier period. It was under Roman domination that the estates received them. They are Latin, and come, for the most part, from family names which are Roman. This does not mean that Italian families came to seize the land. The Gauls, upon becoming 70150 Romans, took Latin names for themselves and applied their new names to their lands. Some retained a Gallic name by Latinizing it; thus, we find a few domain names that have a Gallic root in a Latin form. Subsequently, all these property names became the names of our villages in France. The lineage is easily seen. The original owners were called Albinus, Solemnis, Florus, Bertinus, Latinus or Latinus, Victorious, Paulus, 70155 Julius, Atinius, Cassius, Gabinius, Clipius; and this is why our villages are called Aubigny, Solignac, Fleury, Bertignole, Lagny, Vitry, Pouilly, Juilly, Attigny, Chancy, Gagny, Clichy.

It is difficult to say what the usual extent of a rural domain was in Gaul. We must 70160 first set aside Narbonne, which had been covered with Roman colonies and where the land had been distributed in small lots. We must also set aside some territories in the northeast, close to the frontier and where military colonies of veterans or colonies of Germans were founded; here again it was the small or medium property that was constituted, and there is no appearance that it changed much. It was different in 70165 the rest of Gaul. Here there was no colony, no artificial constitution of property. Either the domains remained in the hands of the old aristocracy that had become Roman, or they passed into the hands of enriched men. In either case, we do not see that the land could have been much divided up. It is very likely that there were a certain number of very small properties; but what prevailed was the large domain. The 70170 small property was spread here and there on Gallic soil, but occupied only a small part of it; The average and large covered almost everything.

Some examples are provided by literature from the 4th and 5th centuries. The poet Ausonius describes a patrimonial property he owns in the region of Bazas. In his 70175 eyes, it is very small; he calls it a villula, a herediolum, and it requires "all the modesty of his tastes" for him to be content with it. We also see that he counts 200 acres of arable land, 100 acres of vineyard, 50 acres of meadows, and 700 acres of woods. This is therefore an estate that is reputed to be small and that comprises 1,050 acres; and if it is reputed to be small, it is because it is so in comparison with many others. One would readily believe that a property of a thousand acres was, 70180 in the eyes of these men, only a small property. The estates that Sidonius Apollinaris describes, without giving their extent, appear to be larger. Taionnacus includes "meadows, vineyards, and plowed land." Octavianus contains "fields, vineyards, olive groves, a plain, and a hill." Avitacus "extends into woods and meadows, and its pastures support many herds." A few years later, we see the Villa 70185 Sparnacus being sold for 5,000 pounds of silver; this enormous sum, especially in a time of crisis and in the circumstances in which we see it sold, implies that this land was very vast.

However, we must beware of exaggeration. Imagining immense latifundia would be a great error. That an entire region or canton belongs to a single owner is something 70190 of which we find no example neither in Gaul, nor in Italy, nor in Spain. Nothing similar is reported by Sidonius, nor by Salvian, nor by our charters. Our general impression, in the absence of affirmation, is that the large estates of the Roman era hardly exceeded the extent that the territory of a village occupies today. Many have only that of our small hamlets. And below these there are still a good number of 70195 smaller properties. There is also a remark that must be made. We know from writers of the 4th century that a class of very rich landowners was formed at this time. This is one of the most important and best-established facts of this part of history. Now, these great fortunes, about which we have some information, were not formed by the

infinite extension of the same domain. They were formed through the acquisition of numerous estates far removed from one another. The most opulent families of this period did not own an entire canton or a province; but they possessed twenty, thirty, or forty estates scattered across several provinces, sometimes throughout all the provinces of the empire. These are the *patrimonia sparsa per orbem* of which Ammianus Marcellinus speaks. Such is the nature of the landed fortunes of the Anicius, Symmachus, Tertullus, and Gregorius in Italy; of the Syagrius, Paulinus, Ecdicius, and Ferreolus in Gaul.

The villa, the rural estate, was a fairly complex organism. It contained, as much as possible, land of every kind: fields, vineyards, meadows, forests. It also included men of all social classes: untenured slaves, tenant slaves, freedmen, colonists, and freemen. The work was done by two very distinct bodies, one being the servile group or *familia*, the other the series of small tenants. The land was also divided into two parts, one which was in the hands of the tenants, the other which the owner kept in his hand. He had this cultivated, either by the servile group, or by the *corvées* of the tenants, or finally by a combination of the one and the other system. There was, in the latter case, a small servile group, to which were added the hands of the tenants at times of the year when a lot of hands were needed. The owner thus drew from his domain a double income, on the one hand the harvests and fruits of the reserved portion, on the other the rents and rents of the tenants. His manager or his steward, procurator, actor or *villicus*, administered and supervised the two portions equally; from the tenures, he received the rents; On the reserved portion, he directed everyone's work.

This domain... was also covered with as many buildings as were necessary for the population and the various needs of a village. It is understandable that no precise description is possible. We see only that three very different types of buildings were distinguished: 1st, the owner's residence; 2nd, the slaves' dwellings, with everything that served the general needs of cultivation; 3rd, the dwellings of the small tenants.

We know very little about the latter; ancient writers never described them. Sometimes these dwellings were isolated from one another, each of them being placed on the plot of land that the man cultivated... Sometimes they were grouped together and formed a small hamlet that the language called a *vicus*. On the largest domains, one could see, as Julius Frontinus says, a series of these *vici* that formed a sort of belt around the master's villa. This villa was always divided into two clearly separated parts, which were distinguished by the expressions *villa urbana* and *villa rustica*. The *villa urbana*, on a rural estate, was the set of buildings that the master reserved for himself, his family, his friends, and all his personal servants. As for the *villa rustica*, it was the set of buildings intended to house the slave farmers; here were also kept the animals and all the objects useful for cultivation.

Varro, Columella, and Vitruvius described this rustic villa. It had to contain a sufficient number of small rooms, *cellae*, for the use of the slaves; and these rooms had to be, as much as possible, "open to the south." For lazy or unruly slaves, there was the *ergastulum*; this was the basement. It had to be lit by enough windows "so that the dwelling was healthy," but narrow enough and high enough above the ground so that the men could not escape. A few steps away were the stables, which, as far as possible, were to be double-glazed, for summer and winter.

Next to the stables were the small bedrooms.

The herdsmen and shepherds' quarters. Then there were the barns for wheat and hay, the wine cellars, the oil cellars, and the granaries for fruit. A kitchen occupied a special building; it had to be high-ceilinged and large enough "to serve as a meeting place at all times for the domestic staff." Not far away was the slave bath, which, moreover, only bathed there on holidays. The estate naturally had its mill, its oven, its wine press, its oil press, and its dovecote. Add to this, if the estate was complete, a forge and a wheelwright's workshop. In the middle of all these buildings stretched a large courtyard; the Latins called it *chors*; we find it again in the Middle Ages with the same, slightly altered name, *curtis*.

Some distance away is the master's villa. This owner is usually wealthy and took pleasure in building. Varro already noted, not without chagrin, that his contemporaries "gave more attention to the urban villa than to the rustic villa." Columella gives a description of this villa. It contains summer apartments and winter apartments; for the master lives there or can live there in all seasons. It therefore has a double dining room and a double series of bedrooms. It contains large bathrooms, where an entire party can bathe at once. There are also long galleries, larger than our living rooms, where friends can walk and chat. Pliny the Younger, who owns about ten beautiful estates, describes two of these dwellings. Everything

70265 imaginable in terms of comfort and luxury is found there. We will probably not assume
that all country houses were similar to those of Pliny; but there were some even more
magnificent than his; and, from top to bottom of the scale, all country houses tended
to resemble the type he describes. He imitated and he was imitated. The luxury of
70270 villas was, in this society of the Roman Empire, the best way to enjoy wealth and
also the most laudable way to display it. Since there were no longer free elections,
the money no longer spent on buying votes was spent on building and decorating
houses. What can also mitigate the disadvantages of a system of large estates is that
the owner enjoys his domain and repays it in improvements or embellishments what he
receives in profits.

70275 If we move from Italy to Gaul, and from the time of Trajan to the 5th century, we
still find vast and magnificent villas there. Sidonius Apollinaris paints a fairly
clear picture, despite the usual vagueness of his style, of the Villa Octaviana,
which belonged to his friend Consentius. "It offers high walls built according to all
the rules of the art." There are "porticoes and baths of admirable grandeur."

70280 Sidonius also describes the Villa Avitacus. It is reached by a wide and long avenue
which is its "vestibule." We first encounter the balneum, that is to say, a group of
buildings which includes baths, a swimming pool, a frigidarium, a perfume room; it is
a whole large building. Leaving there, we enter the house. The women's apartment
presents itself first; it includes a workroom where the cloth is woven. Sidonius then
70285 leads us through long porticoes supported by columns and from where the view extends
over a beautiful lake. Then comes an enclosed gallery where many friends can stroll.
It leads to three dining rooms. From these, one passes into a large relaxation room,
the diversorium, where one can, as one chooses, sleep, chat, or play. The writer does
not bother to describe the bedrooms, nor even to indicate their number. What he says
70290 about the villas of his friends suggests that several were more magnificent than his
own. These beautiful residences, which once covered Gaul, did not perish without
leaving many traces. Remains of them are found in all parts of the country, from the
Mediterranean to the Rhine and as far as the bottom of the British peninsula.
In the description of the Villa Octaviana, we must note a chapel. Indeed, a law of
70295 398 states as "a custom" that large landowners have a church on their property.
The common language of the empire designated the master's house by the word
praetorium. This term is already found, with this meaning, in Suetonius and Statius;
it is found several times in Ulpian and the jurists of the Digest; it becomes
especially frequent among authors of the 4th century, like Palladius and Symmachus.

70300 Now this word, by its very root, indicated the idea of command, precedence,
authority. It had been applied, in a Roman camp, to the general's tent; in the
provinces, to the governor's palace. The history of a word marks the course of ideas.
There is no doubt that, in the thoughts of men, this dwelling of the master was, in
comparison to all the other buildings scattered across the estate, the house that
70305 commanded the most. Calling it a praetorium was like calling it a manor house.
A writer of the time, Palladius, recommended building it halfway up the hill and
always higher than the villa rustica. This rustic villa, with its population, its
series of stables and barns, its mill, its press, its workshops, and all its numerous
staff, was more than what we call a farm: it formed a sort of village, owned by the
70310 master and staffed by his servants. The villa rustica at the bottom of the hill and
the villa urbana halfway up the hill were already the village and castle of later
periods.
It is true that this 4th-century castle did not have the appearance of the 10th-
century castle. The turrets sometimes mentioned were not feudal towers. There were no
70315 moats, no enclosure, no portcullis, no battlements, but rather avenues and porticoes
inviting entry. This was because people lived in an age of peace and believed
themselves safe. Only around the middle of the 5th century do we see a few men like
Pontius Leontius fortifying their villa and surrounding it with a thick wall "that no
battering ram could break down." It was only then, to resist invading looters, that
70320 the idea of transforming the villa into a fortified castle arose. Until then, the
villa had been a castle, but a castle of peaceful and happy times, an elegant,
sumptuous, and open castle.
These great landowners spent most of their lives there, surrounded by their families
and a large retinue of slaves, freedmen, and clients. These men clearly loved castle
70325 life; There can be no doubt about this when one has read the letters of Symmachus or
those of Sidonius Apollinaris. They built, they managed the cultivation, they carried
out irrigation, they lived among their peasants. A Syagrius, in his beautiful estate
of Taionnac, "cut his hay and did his grape harvest." A Consentius, son and grandson
of the highest dignitaries of the empire, is represented by Sidonius "putting his
70330 hand to the plow," as the old legend had represented Cincinnatus. The friends of

Ausonius, those of Symmachus, are for the most part large landowners and they enjoy rural life. Modern historians have said that Roman or Gallo-Roman society only loved city life, and that it was the Germans who taught people to love the countryside... All the writings we have from the 4th and 5th centuries, on the contrary, depict the Roman aristocracy as a rural class as much as an urban one: it is urban in the sense that it exercises magistracies and administers the cities; it is rural in its interests, in the greater part of its existence, in its tastes. This is because, in these beautiful residences, people led the life of a great lord. Paulinus of Pella, recalling in his verses the time of his youth, describes "the large residence where all the delights of life were gathered" and where "the crowd of servants and clients" crowded. This was on the eve of the invasions. "The table was elegantly served, the furniture brilliant, the silverware precious, the stables well-stocked, the carriages comfortable." The pleasures of castle life included conversation, horseback riding or carriage rides, tennis, dice, and above all, hunting. Hunting was always a Roman favorite. Varro already speaks of the vast warrens, filled with deer and roe deer, which the owners reserved for their pleasures. The friends to whom Pliny wrote divided their time "between study and hunting." He himself, a mediocre hunter who carried a book and tablets, nevertheless boasted of having once killed three wild boars. The jurists of the Digest mention, among the objects that are ordinarily an integral part of the estate, the hunting equipage, the huntsmen, and the pack. Later, Symmachus wrote to his friend Protadius and mocked him for his endless hunts and "the genealogy of his dogs." The Gauls were also great hunters. They had been so before Caesar, and they were still so after him. One only has to look at the mosaics which, like that of Lillebonne, represent hunting scenes. Look at the friends of Sidonius: Ecdicius "pursues the beast through the woods, swims across rivers, loves only dogs, horses and bows." It is true that the same man just now, at the head of a few horsemen raised on his lands, will rout a troop of Visigoths. Here is another friend of Sidonius, Potentinus: "he excels at three things, cultivating, building, hunting." Vectius, a great personage and high official, "is second to no one in raising horses, training dogs, carrying falcons." Hunting was one of the rights of the landowner on his land, and he used it willingly. Thus, many things that the Middle Ages will offer to our eyes are older than the Middle Ages.

Fustel de Coulanges, *L'Alleeu and the Rural Estate during the Merovingian Period*, Paris: Hachette, 1889, octavo. Passim.

III — CHRISTIANITY.

PROGRESS OF ORGANIZATION.—THE CHRISTIAN EMPIRE.

...The organization of the Church was being completed with surprising rapidity. The great danger of Gnosticism, which was to divide Christianity into countless sects, was averted by the end of the second century. The term Catholic Church burst forth from all sides, like the name of this great body that would henceforth endure through the centuries without breaking up. And we can already clearly see the character of this catholicity. The Montanists were considered sectarians; the Marcionists were convicted of distorting apostolic doctrine; the various Gnostic schools were increasingly rejected from the bosom of the general Church. There is therefore something that is neither Montanism, nor Marcionism, nor Gnosticism, which is non-sectarian Christianity, the Christianity of the majority of bishops, resisting heresies and using them all up, having, if you will, only negative characteristics, but preserved, by these negative characteristics, from pietistic aberrations and the rationalist solvent. Christianity, like all parties that want to live, disciplines itself, cuts off its own excesses... The golden mean triumphs. The pietistic aristocracy of the Phrygian sects and the speculative aristocracy of the Gnostics are equally dismissed from their claims...

It was the episcopate which, without any intervention from the civil power, without any support from the police or the courts, thus established order above liberty in a society founded primarily on individual inspiration. This is why the Ebionites of Syria, who do not have the episcopate, also do not have the idea of catholicity. At first glance, the work of Jesus was not born viable; it was chaos. Founded on a belief in the end of the world, which the passing years would convince of error, the Galilean congregation seemed capable of nothing but dissolving into anarchy... Individual inspiration creates, but immediately destroys what it has created. After freedom, there must be rule. The work of Jesus could be considered saved the day it was admitted that the Church has a direct power, a power representing that of Jesus. The Church from then on dominates the individual, driving him from its midst if necessary. Soon the Church, an unstable and changing body, is personified in the elders; the powers of the Church become the powers of a clergy dispenser of all

graces, intermediary between God and the faithful. Inspiration passes from the individual to the community. The Church has become everything in Christianity; one step further, the bishop becomes everything in the Church. Obedience to the Church, then to the bishop, is considered the first duty; innovation is the mark of falsehood; schism will henceforth be the worst crime for the Christian...

Correspondence between the Churches was early a custom. The circular letters from the heads of the great Churches, read on Sundays at the gathering of the faithful, were a continuation of apostolic literature. The church, like the synagogue and the mosque, is an essentially urban thing. Christianity (the same can be said of Judaism and Islam) will be a religion of cities, not a religion of peasants. The peasant, the pagan, will be the last resistance Christianity will encounter. Rural Christians, very few in number, came to the church in the neighboring town.

The Roman municipality thus became the cradle of the Church. As the countryside and small towns received the Gospel from the large cities, they also received their clergy, always subject to the bishop of the large city. Among cities, the *civitas* alone has a true church, with an *episcopus*; the small town is ecclesiastical dependent on the large one. This primacy of large cities was a crucial fact. Once the large city was converted, the small town and the countryside followed suit. The diocese was thus the original unit of the Christian conglomerate.

As for the ecclesiastical province, implying the precedence of the large Churches over the small ones, it generally corresponded to the Roman province. The founder of the framework of Christianity was Augustus. The divisions of the cult of Rome and Augustus were the secret law that regulated everything. The cities that had a *flamen* or *archiereus* were those that later had an archbishop; the *flamen civitatis* became the bishop. From the 3rd century onwards, the *flamen duumvir* occupied in his city the rank which, a hundred or a hundred and fifty years later, was that of the bishop in the diocese. Julian later tried to oppose the *flamens* to the Christian bishops and to make parish priests out of the *Augustales*. Thus the ecclesiastical geography of a country is, with very little difference, the geography of this same country in the Roman period. The table of bishoprics and archbishoprics is that of the ancient *civitates*, according to their links of subordination. The empire was like the mold where religion as a new system coagulated. The internal framework, the hierarchical divisions, were those of the empire. The ancient roles of the Roman administration and the registers of the Church in the Middle Ages and even today are almost identical.

Rome was the point where this great idea of catholicity was developed. Its Church had an undisputed primacy. It owed this in part to its holiness and its excellent reputation. Everyone recognized that this Church had been founded by the apostles Peter and Paul, that these two apostles had suffered martyrdom in Rome, and that John himself had been plunged into boiling oil there. The places sanctified by these Apostolic Acts, partly true, partly false, were shown. All this surrounded the Church of Rome with an unparalleled aura. Doubtful questions were brought to Rome for arbitration, if not resolution. It was reasoned that since Christ had made Cephas the cornerstone of his Church, this privilege should extend to his successors. The Bishop of Rome became the bishop of bishops, the one who warns others... The work of which the fragment known as the Canon of Muratori was part, written in Rome around 180, already shows us Rome regulating the Canon of the churches, giving the Passion of Peter as the basis for catholicity... The attempts at a symbol of faith also began in the Roman Church around this time. Irenaeus refutes all heresies by the faith of this Church, "the greatest, the most ancient, the most illustrious; which possesses, by continuous succession, the true tradition of the apostles Peter and Paul, to which, because of its primacy, *propter potiore principalem*, the rest of the Church must have recourse." Every Church supposedly founded by an apostle had a privilege; What can be said of the Church believed to have been founded by the two greatest apostles simultaneously?

... We can say that the organization of the Churches has undergone five degrees of advancement. First, the primitive *ecclesia*, where all members are equally inspired by the Spirit. Then the elders or *presbyteri* assume, within the *ecclesia*, considerable police power and absorb the *ecclesia*. Then the president of the elders, the *episcopos*, absorbs more or less the powers of the elders and consequently those of the *ecclesia*. Then the *episcopi* of the different Churches, corresponding with each other, form the Catholic Church. Among the *episcopi*, there is one, that of Rome, which is evidently destined for a great future. The Pope, the Church of Jesus transformed into a monarchy, are seen in the obscure distance... Let us add that this transformation did not have, like the others, a universal character. The Latin Church alone lent itself to this, and even within this Church, the papacy's attempt

ultimately led to revolt and protest.

The Church, in the third century, by monopolizing life, exhausted civil society, bled it dry, and emptied it. Small societies killed the great society. Ancient life, a purely external and virile life, a life of glory, heroism, civic duty, the life of the forum, the theater, the gymnasium, was vanquished by Jewish life, an anti-military life, the life of pale, cloistered people. Politics does not require people too detached from the earth. When man decides to aspire only to heaven, he no longer has a country here below... Christianity improved the morals of the ancient world, but, from a military and patriotic point of view, it destroyed the ancient world. The City and the State would later accommodate Christianity only by subjecting it to the most profound modifications.

"They dwell on earth," says the author of the Epistle to Diognetus, "but, in reality, they have their homeland in heaven." Indeed, when the martyr is asked about his homeland, "I am a Christian," he replies. The homeland and civil laws—this is the mother, this is the father, that the true Gnostic, according to Clement of Alexandria, must despise in order to sit at the right hand of God. The Christian is embarrassed, incapable, when it comes to worldly affairs; the Gospel forms the faithful, not citizens. It was the same for Islamism and Buddhism. The advent of these great universal religions put an end to the old idea of homeland; one was no longer Roman, Athenian: one was Christian, Muslim, Buddhist. From now on, men will be divided according to their religion, not according to their homeland; they will be divided over heresies, not over questions of nationality. This is what Marcus Aurelius saw perfectly, and what made him so unfavorable to Christianity. The Church seemed to him a state within a state. "The camp of piety," this new "system of piety founded on the divine Logos," has nothing to do with the Roman camp, which in no way claims to form subjects for heaven. The Church, in fact, admits to being a complete society, far superior to civil society; the pastor is worth more than the magistrate... The Christian owes nothing to the empire, and the empire owes him everything, for it is the presence of the faithful, scattered throughout the world Roman Empire, which stops the wrath of heaven and saves the State from ruin. The Christian does not rejoice in the victories of the empire; public disasters seem to him a confirmation of the prophecies that condemn the world to perish by barbarians and by fire...

[However] ancient and profound reasons required, despite appearances to the contrary, that the empire should become Christian. The Christian doctrine on the origin of power seemed expressly designed to become the doctrine of the Roman State. Authority loves authority. Men as conservative as the bishops must have been terribly tempted to reconcile themselves with public force. Jesus had laid down the rule. The effigy of the currency was for him the supreme criterion of legitimacy, beyond which there was nothing to seek. In the midst of Nero's reign, Saint Paul wrote: "Let everyone be subject to the ruling powers, for there is no power except from God." The powers that exist are ordained by God, so that whoever opposes the powers resists the order of God." A few years later, Peter, or whoever wrote in his name the epistle known as Prima Petri, expressed himself in an almost identical way. Clement was also a most devoted subject of the Roman Empire. Finally, one of the traits of Saint Luke is his respect for imperial authority and the precautions he took not to offend it.

Certainly, there were exalted Christians who entirely shared Jewish anger and dreamed only of the destruction of the idolatrous city, identified by them with Babylon. Such were the authors of apocalypses and the writers of Sibylline writings. For them, Christ and Caesar were two irreconcilable terms. But the faithful of the great Churches had quite different ideas. In 70, the Church of Jerusalem, with a sentiment more Christian than patriotic, abandoned the revolutionary city and sought peace beyond the Jordan. Saint Justin, in his Apologies, never combats the principle of empire; he wants the empire to examine Christian doctrine, approve it, countersign it in some way, and condemn those who slander it. The leading doctor of the time of Marcus Aurelius, Melito, Bishop of Sardis, was seen to make even more characteristic offers of service and present Christianity as the basis of a hereditary empire by divine right... All apologists flatter the emperors' favorite idea, that of heredity in a direct line, and assure them that the effect of Christian prayers will be that their son will reign after them...

The hatred between Christianity and the empire was the hatred of people who must one day love each other. Under the Severans, the language of the Church remained what it had been under the Antonines: plaintive and tender. Apologists displayed a kind of legitimacy, the claim that the Church had always saluted the emperor first. Saint Paul's principle bore fruit: "All power comes from God; he who holds the sword holds it from God for good." This correct attitude toward power was due to external

70530 necessities as much as to the very principles the Church had received from its
founders. The Church was already a large association; it was essentially
conservative; it needed order and legal guarantees. This is admirably seen in the
actions of Paul of Samosata, Bishop of Antioch under Aurelian. The Bishop of Antioch
70535 could already be considered, at this time, a high-ranking personage; the Church's
assets were in his hands; a multitude of people lived off his favors. Paul was a
brilliant man, hardly mystical, worldly, a great secular lord, seeking to make
Christianity acceptable to the world and to those in authority. The Pietists, as was
to be expected, found him a heretic and had him deposed. Paul resisted and refused to
70540 abandon the episcopal house. This is the problem with the most haughty sects: they
possess; and who can settle a question of property or enjoyment, if not the civil
authority? The question was referred to the emperor, who was at the moment in
Antioch, and we saw this unusual spectacle of an unfaithful and persecuting sovereign
charged with deciding who was the true bishop. Aurelian... had the correspondence of
the two bishops brought to him, noted the one who had relations with Rome and Italy,
70545 and concluded that this one was the bishop of Antioch. ...One fact was becoming
evident: Christianity could no longer survive without the empire, and the empire, on
the other hand, had nothing better to do than adopt Christianity as its religion. The
world wanted a religion of congregations, of churches or synagogues, of chapels, a
religion where the essence of worship was assembly, association, and brotherhood.
70550 Christianity fulfilled all these conditions. Its admirable worship, its pure
morality, its skillfully organized clergy, assured its future.
Several times in the third century, this historical necessity almost came true. This
was especially true during the time of the Syrian emperors, whose status as
foreigners and the baseness of their origins protected them from prejudice, and who,
70555 despite their vices, inaugurated a breadth of ideas and tolerance previously unknown.
The same thing happened again under Philip the Arab, in the East under Zenobia, and,
in general, under the emperors whose origins placed them outside Roman patriotism.
The struggle redoubled in fury when the great reformers, Diocletian and Maximian,
believed they could give the empire new life. The Church triumphed through its
70560 martyrs; Roman pride gave way; Constantine saw the inner strength of the Church, the
populations of Asia Minor, Syria, Thrace, Macedonia—in a word, the eastern part of
the empire—already more than half-Christian. His mother, who had been an innkeeper in
Nicomedia, dangled before his eyes an Eastern empire centered around Nicaea, the
heart of which would be the favor of the bishops and the multitudes of poor people
70565 registered with the Church, who, in the large cities, formed public opinion.
Constantine inaugurated what is called "the peace of the Church," and what was in
reality the domination of the Church...
Julian's reaction was a meaningless whim. After the struggle came intimate union and
love. Theodosius inaugurated the Christian empire, that is, the thing the Church, in
70570 its long life, had loved most, a theocratic empire, of which the Church is the
essential framework, and which, even after being destroyed by the barbarians, remains
the eternal dream of the Christian conscience, at least in the Romance countries.
Many believed, in fact, that with Theodosius the goal of Christianity had been
achieved. The empire and Christianity became so closely identified with each other
70575 that many scholars conceived the end of the empire as the end of the world, and
applied to this event the apocalyptic images of the supreme catastrophe. The Eastern
Church, whose development was not hindered by the barbarians, never detached itself
from this ideal; Constantine and Theodosius remain the two poles; it still clings to
them, at least in Russia... As for the Western Christian empire, although it soon
70580 perished, it was only destroyed in appearance...; its secrets were perpetuated in the
high Roman clergy... A holy empire, with a barbarian Theodosius, holding the sword to
protect the Church of Christ, such was the ideal of the Latin papacy in the Middle
Ages...

70585

IV — ROMAN SOCIETY

ACCORDING TO AMMIANUS MARCELLINUS, SAINT JEROME, AND SYMMACHOS.
People have often wondered what to think of public morality in the fourth century,
especially among the upper classes of the empire. Generally, we are tempted to judge
70590 it harshly. When we consider that this society was in decline, and that it had only a
few years left to live, we are tempted to explain its misfortunes by its faults and
to believe that it deserved the fate it was about to suffer. This is why we so easily
believe those who speak ill of it. There were two contemporaries in particular,
Ammianus Marcellinus and Saint Jerome, who took pleasure in mistreating it; and,
70595 since they belonged to two opposing factions, it seems natural to us to think that,
since they agreed, they spoke the truth. I admit, however, that their testimony is

suspect to me. Ammianus devoted two long chapters of his history to the senators of Rome; but these chapters have, in his work, a particular character: one realizes, when one reads them carefully, that he wanted to compose pieces with effect, which would strike the reader, and that, in these passages, which do not entirely resemble the rest, he is more satirist and rhetorician than historian... What does he tell us, moreover, that we do not know in advance? He teaches us, which does not surprise us at all, that there are in this great world many very small minds: fools who believe themselves great men because their flatterers have erected statues to them; vain people, who walk on magnificent chariots, wearing silk garments whose thousand colors are stirred in the wind; glorious people, who talk incessantly of their fortune; effeminate people, whom the slightest heat overwhelms, "who, when a fly lands on their golden robes or a small ray of sunshine slips through some crack in their parasol, are sorry they were not born in the Cimmerian Bosphorus"; atheists, who only leave their homes after consulting their astrologers; prodigals, caressing and base when they want to borrow money, insolent when it is necessary to return it, and other characters of this sort, who are found everywhere. Besides these failings, which seem to us on the whole rather minor, he points out more serious vices. Some of them belong more particularly to the Roman race, and the moralists of past centuries have already revealed them; others are from all countries and all times, and since unfortunately no human society escapes them, it is natural that we also find them among the people of the 4th century. But what seems to him more odious than all the rest, what most often excites his bad humor, is that the great Roman lords lack consideration for the learned and the wise. They reserve their favors for those who flatter them basely or who amuse them; as for honest and learned people, they are considered boring and useless, and the head waiter has them unceremoniously shown the door of the dining room. We know these complaints; they are not new to us. One of the serious reasons Juvenal has for scolding his era is that the Roman customer, "who saw the light of day on the Aventine and who was nourished from his childhood on the Sabine olive," does not have as good a place as the Greek parasite at the master's table, that he is not served the same dishes and that he does not drink the same wine. Ammianus no doubt had to suffer some humiliation of this kind. It is likely that when he returned from the army, where he had fought well, and at the time when he was beginning to write the history of his campaigns, he was not received by everyone as he thought he should be. He naturally concluded that a society which did not always give him his place took no account of merit. "Today," he says, "the musician has driven the philosopher from everywhere; the orator is replaced by the one who teaches histrions their trade; libraries are closed and resemble sepulchres." It is difficult to believe that these severe words apply to people like Symmachus and his friends, who loved books so much and held scholars in such great honor. But Ammian seems to recognize elsewhere that one should not give too much importance to his reproaches and make them fall on everyone; He tells us, at the beginning of his violent invectives, that Rome is still great and glorious, but that its splendor is compromised by the criminal frivolity of a few people (*levitate paucorum incondita*) who do not sufficiently consider of which city they have the honor to be citizens. Thus, by his own admission, the guilty are only the exception. The anger of Saint Jerome inspires no more confidence in me than the epigrams of Ammianus. He was a very hot-tempered saint; his best friends, like Rufinus and Saint Augustine, have experienced this. People of this temperament suddenly go from one extreme to the other, and usually hate most what they loved most. This is precisely what made Saint Jerome so hard on Roman society: he had been too charmed by it and could never forgive it for the attraction it had had for him. The delicate pleasures of his literary vanity, his frequent conversations with women of wit, the pleasure they found in listening to him, the applause they gave to his works, all this was part of those "delights of Rome," the poignant memory of which followed him into the desert and troubled his penance. He made them pay with his invectives for the trouble he felt in detaching himself from it. Rome is for him another Babylon, "the courtesan in purple clothes." He generally reproaches it for all sorts of excesses; but it is remarkable that, when he comes to specific accusations, he finds little to criticize in it except the trivialities of worldly life. How do we spend our time in the big city? Seeing and being seen, receiving visits and making them, praising people and speaking ill of them. "Conversation begins, we gossip never stops. We tear apart those who are absent, we tell stories about our neighbors, we bite others and, in turn, we are bitten by them." This picture is pleasant; but what does it prove, if not that society at all times is similar? Let us note that Saint Jerome attacks everyone here, without distinction of religion. It has been sought to use his testimony to establish that pagan society was by far the most corrupt: this is a

wrong, it is even harder for Christians than for it. He shows us that the vices of the old society had passed into the new, almost without changing form, that one could not always distinguish the virgin and the widow who had received the teachings of the Church from those who had remained faithful to the old cult, that there were clerics who were petty masters, monks who were chasing inheritances, and above all parasitic priests who went every day to greet the beautiful ladies: "He gets up in all haste, as soon as the sun begins to show, regulates the order of his visits, chooses the shortest routes, and seizes the ladies he goes to see almost still in bed. If he sees a cushion, an elegant tablecloth or some object of that kind, he praises it, he feels it, he admires it, he complains of having nothing as good at home, and does so well that it is given to him. Wherever you go, he is always the first person you meet; he knows all the news; he runs to tell them before everyone else; if necessary, he invents them, or, in any case, he embellishes them each time with new incidents." Is this not like a first appearance of the 18th-century abbot?

There are therefore reasons to only half-believe Saint Jerome and Ammian; and even if we were to believe them completely, their testimony seems less damning for their century than has been claimed. In any case, the letters of Symmachus[16] give a better opinion of them, and I trust them all the more willingly because he did not claim to judge his time and write a moral treatise, which always leads to adopting a certain attitude. He naively says what he thinks, shows himself to us as he is, and describes people without knowing it. His letters are those of an honest man, who gives everyone the best advice. To those who govern provinces exhausted by taxes and war, he preaches humanity; he recommends charity to the rich, in terms that recall Christian charity. Sometimes he enters resolutely into the private lives of his friends; for example, he dares to ask one of them to renounce the profits of an unjust inheritance. As for him, he is everywhere occupied in doing good; he comes to the aid of his unfortunate friends, takes care of their affairs, implores the help of powerful men for them, marries their daughters, and, after their death, redoubles his care for the children they leave without protection and often without fortune. His correspondence does not make him alone; it sometimes allows us to judge those with whom he was in contact. His children form united households, his friends, for the most part, resemble him, and when one has finished reading his letters, it seems that one has just passed through a society of honest people. I know well that he is inclined to judge with a little too much indulgence; He readily attributes his qualities to others and does not perceive the harm he would not be capable of committing; but, despite this fault, it is impossible not to take great account of his testimony. The impression that remains of this great world of Rome, as we glimpse it in his letters, is, on the whole, favorable to him and recalls the society of Trajan and the Antonines as shown to us in the letters of Pliny.

Here is another piece of information that we owe to the correspondence of Symmachus, and which somewhat contradicts the opinion we have of this period. It seems to us that the people of that generation, which was the last of the empire, must have had some sense of the perils that threatened them, and that it is impossible that by listening a little one could not hear the creaking of this machine that was so close to breaking down. The letters of Symmachus show us that we are mistaken. We see there that the most distinguished people, the statesmen, the politicians, hardly suspected that the end was approaching. On the eve of the catastrophe, everything went on as usual, people were buying, selling, repairing monuments and building houses for eternity. Symmachus is a Roman of ancient times, who believes that the empire is eternal and does not imagine that the world can continue to exist without it. Despite the warnings he has received, his optimism is imperturbable. He would certainly have many reasons to be discontented: the Senate, of which he is so proud to be a member, is almost nothing anymore, and the religion he professes is persecuted. However, he never ceases to praise his teachers and is satisfied with his time. He was one of those candid souls who regard as incontestable truths that civilization always triumphs over barbarism, that the most educated people are inevitably the most honest and the strongest, that letters flourish whenever they are encouraged, etc. Now he sees precisely that schools have never been more numerous, education more widespread, science more honored, that letters lead to everything, that personal merit opens all careers; so he exclaims, in his enthusiasm: "We truly live in a century that is friendly to virtue, where people of talent can only blame themselves if they do not obtain the positions of which they are worthy." And it does not seem possible to him that such an enlightened society, which so highly values literature and places such great value on learning, could be swept away in a day by barbarians!

Yet he does occasionally see and note in passing a few unfortunate incidents, which revealed the evil from which the empire was suffering, and which should have given

him pause for thought. For example, he tells someone who is waiting for him that he cannot leave Rome because the countryside is infested with brigands: so the Roman peace, so vaunted in inscriptions and medals, is over, since, even at the gates of the capital, one is no longer safe! Another time he complains that the emperor, who is short of soldiers, is asking rich people for their slaves to enlist, and this measure does not reveal to him the extremes to which the empire is reduced! But what is even more significant, what indicates more clearly a profound disorder and announces the approaching ruin, is the sad state of public wealth. The evidence of this is everywhere in Symmachus. He shows us that the tax authorities have exhausted everything, that the rich are at the end of their resources, that farmers no longer have money to pay their landlords, and that land, which was a source of income, is now only an occasion for expenditure. These are serious symptoms; and yet Symmachus, who sees them, who points them out, does not seem alarmed by them. This is because the evil was old, that it had increased little by little, and that, since the time that people had suffered from it, they had become accustomed to it. Since Rome persisted in living, despite the reasons it had to die, people had ended up believing that it would always live. Until the last moment, people had entertained this illusion, and the final catastrophe, although it should have been expected, was a surprise. This is what the letters of Symmachus bring to light; They show us to what extent politicians, nourished by the lessons of history and thoroughly familiar with ancient times, can be mistaken about the era in which they live; they show us the spectacle, full of serious lessons, of a society proud of its civilization, glorious of its past, preoccupied with the future, which advances step by step to the edge of the abyss, without realizing that it is about to fall into it.

Father en son Holwerda, row with van Giffen

5 December 1898 **COMMUNICATIONS OF VARIOUS NATURE.**
 REPORT by Dr. A.E.J. Holwerda,
 concerning the scientific journey to Italy and Greece.
 To His Excellency the Minister of Internal Affairs.

The scientific journey to Italy and Greece, which I was enabled to undertake by the Government, had a multifaceted purpose. In the first place, it was of course in the interest of my education. I have been charged with explaining the history, art, and life of ancient peoples, and if one wants to fulfil such a task properly, then one's own observation of the country of ruins, of the works of art that are still preserved on classical soil, is absolutely indispensable. It is entirely connected with this that all kinds of special research, which had occupied me for a long time, could hardly be continued without study in the excavated areas and the museums of Italy and Greece. Likewise I hoped to be able to expand the material resources for the study of archaeology in our country; the University Fund opened me a considerable credit for this purpose and the director of the National Museum of Antiquities instructed me to try to see whether any gaps in that collection could be filled by suitable purchases in Italy and Greece. Finally I thought I could and should promote another interest of national science. Recently there has been strong pressure from several sides, and rightly so, that our young scholars should be given more opportunity than hitherto to undertake a scientific journey to complete their studies. I had my own opinion about the best way to do this, and I very much desired to be able to test it in practice. Of course Italy and Greece, which are so extensively travelled by scholars, offered ample opportunity for this. If the sending out of young scholars is to bear fruit, it must be done with deliberation and we can mirror ourselves on the examples of others, both in what we leave as well as in what we must do.

What made my journey very easy was an arrangement by the curators of our University, whereby my son, the doctoral candidate in classical literature J.H. Holwerda, was enabled to accompany me through a subsidy from the Vollenhoven fund. With the greatest appreciation I also remember the friendly helpfulness that we experienced in Italy, Greece and Constantinople from our ambassadors and consular agents. No less do I feel deeply obliged to the Kaiserlich-Deutsch Archaeological Institut. The

perfectly unfettered and selfless way in which that institution supports the studies of foreigners as well, is an honour for the German nation, because it springs from that same honest idealism that constitutes the strength of German science. In all kinds of matters our German colleagues in Italy and Greece helped us with their
70800 advice and information; we enjoyed their company, attended their lectures, accompanied them on their travels, and even stayed in Rome in the Institute building, which had some space available there. Thus, among others, the names of Professors E. Petersen, Ch. Hülsen, A. Mau in Rome, W. Dörpfeld and P. Wolters in Athens will
70805 remain in our memory for other reasons than the services these men rendered to science. The narrow-mindedness that characterizes some museum boards in Italy was very striking. Nevertheless, we were kindly granted tickets for free admission to the State Museums; we gratefully remember in particular the truly generous board of the Museum of Naples and the excavations of Pompeii. The way in which the Greek
70810 collections are made available for study is, in a word, exemplary and it is therefore very regrettable that, for example, in Delphi, which was excavated by the école Française, the Greek Museum Board, headed by the well-known general-ephoros P. Kabbadias, cannot yet act with full authority, by virtue of the agreement with France. Understandably, the French stipulated for themselves the right of first
70815 publication of what was found there, but for a very long time, a decade, and with a ban on all foreigners not only from drawing and photographing, but even from making notes. Every visitor is therefore closely followed by a soldier.

We left Leiden on 22 December 1897. From the beginning, the main thing for us was to limit ourselves; we wanted to see what we saw well. That is why we also reserved the longest time for Greece. Italy is relatively easy to reach again. Our visit to
70820 Florence was therefore a preliminary acquaintance; we stayed there for only three days. In Rome, however, we worked for four weeks. Also with a view to our later studies in Greece, a more accurate study of numerous works of art in Roman museums was very desirable. We made certain studies in the Vatican, the Capitoline Museum,
70825 the Conservator's Palace, in the warehouse belonging to the last two institutions and in the so-called Thermenmuseum. The Kircherianum Museum, the palae-ethnological collections and the museum in the villa Papa Giulio were visited more cursorily by us. Of modern art we looked at some of the most famous works by Raphael and
70830 Michelangelo. More deliberately we studied some works of ancient Christian art, among others the St. Clemente and some Catacombs.

One will never learn to understand antiquity without penetrating to some extent into the spirit of later times and in particular that which immediately followed the downfall of ancient civilization is of interest to the antiquarian. Of the Roman
70835 ruins we made a more special study of the Forum, Palatinus and the Colosseum. We visited Tivoli, the villa Hadriana, the via Appia and Latina. Particularly instructive was a journey that we undertook with the German Institute under the leadership of professor Petersen to the Etruscan necropolises of Cervetri (Caere) and Corneto (the ancient Tarquinii). In Cervetri one sees the most remarkable examples of
70840 tomb dwellings hewn in the rocks; the tombs of Corneto are famous for their numerous wall paintings that are still exceptionally well preserved. These fully deserved a careful and complete publication. Etruscan art, as is well known, is to a large extent a reflection of Greek art, and thus the wall paintings of Corneto can give us a good idea of Greek painting techniques in different periods. From Rome we went to
70845 Naples, where we worked for a few days in the great Museum with its sculptures, its vases, its immense collections from Pompeii, especially the wall paintings, which were formerly removed from the walls; nowadays they are more protected on the spot by shelters and wooden sheds. We also stayed for a few days in Pompeii itself. The newly excavated Casanuova attracted our attention in particular. Its wall paintings in
70850 particular are excellently preserved and fortunately heretoo the decorative whole has been left untouched. We especially tried to inform ourselves about the different building methods in the different periods, since this is also one of the things that one can really only learn properly from the monuments themselves. We then travelled
70855 from Pompeii via Castellamare, Sorrento, Capri, Amalfi to Cava through one of the most beautiful regions of Italy. From Cava we visited the temples of Paestum, ancient Hellenic buildings that have been relatively well preserved, so that they are of great importance for our knowledge of Hellenic architecture. On the way it was especially the beautifully situated Amalfi, so important for the history of the
Middle Ages, that attracted our attention.

On February 4, 1898 we went to Brindisi, where we embarked for Greece in the evening.
70860 Stormy weather was the reason that we only arrived in Patras in the evening of the 6th. On the 7th the train took us along the Corinthian and Saronic Gulfs to Athens.

That journey in the train that moves very slowly in Greece is already highly interesting.

One immediately gets a deep impression of the peculiar Greek nature with its naked mountains and rocks of different tints and the deep blue sky reflected in the beautiful water surface. From the railway one soon obtains, opposite Lepanto, a view of the terrain of the naval battles of Phormio in the Peloponnesian War and the famous battle of Don Juan of Austria. One passes numerous places well-known from history; especially the location of Megara and its port city of Nisaia can be excellently viewed from the train.

We stayed in Athens for about two months. Almost daily we studied in the National Museum and in that of the Acropolis, simple but excellent facilities. Here are displayed most of the original Greek works of art that the excavations of recent years brought to light. In the Museum of the Acropolis are collected all the objects that were found there, especially during the most recent excavations when it was exposed down to the rocky bottom. The National Museum has, besides its numerous sculptures, an immense collection of funerary reliefs, a collection of vases which is so important for the study because they were almost all found on Greek soil – most of the Greek vases in European museums come from tombs in Italy – and then a completely unique collection of Mycenaean art products. Furthermore, all the important ruins were studied in detail; in several of them we had the opportunity to really to be allowed to listen to the explanations of the architect-archaeologist of the German Institute, Prof. Dörpfeld. At the Parthenon our study was at once facilitated and hampered by a scaffolding that had been erected for necessary repairs on the west facade. This of course spoiled the view of the building on that side, but because the general-ephoros Kabbadias gave us a permit to climb up, the study of the details of the superstructure was greatly facilitated. On the south side of the acropolis we were mainly occupied with the Bacchic theatre that was now completely exposed there. Here it is especially that one can study the great question concerning the arrangement of the ancient Greek theatres and on the basis of what I observed here and later also elsewhere, especially in Epidauros, I do not believe that there can be any reasonable doubt whether Prof. Dörpfeld is completely right with his theory that the Greek theatres had no stage, but that there was playing on the flat floor of the orchestra. On the west side the German excavations in particular attracted our attention. A large water conduit from the time of Pisistratus was discovered there and it can hardly be otherwise than that this must be the famous Enneakrounas, although one cannot agree with all the arguments that Prof. Dörpfeld gives for this. The steep northern slope is now being exposed by the Greek archaeological society. We climbed the narrow paths along the very steep rock face here, where the well-known caves of Pan and Apollo and a covered passage can now be clearly distinguished. That the so-called Temple of Theseus, the city walls and the cemetery of Dipylon, the Pnyx, the Areopagos, the Temple of Zeus east of the Acropolis, the bed of the Ilissos at the place where some (though wrongly) seek the Enneacrounus, the stadium, the monument of Lysicrates, the buildings at the market, such as the stoa of Attalos, – that all this was repeatedly and accurately inspected by us, needs no explanation. We also undertook several trips through the country of Attica. Especially the Piraeus and the bay of Phalero were repeatedly visited. Likewise we went a few times to the beautiful northeastern part of the country, the monastery of Pendeli and the royal pleasure-place Tatoi, the old Dekeleia, known from the Peloponnesian war. Here the fairly high mountains are covered with large forests. The significance that this point at the passage to Boeotia must necessarily have had in a war on Attic territory, is clearly evident here on the spot itself. With a similar purpose we visited Phyle, the citadel to which Thrasybulos retreated in 403; there one still finds the remains of an important Greek fortification and the exceptionally favourable location of this refuge, which even today is not reached without effort along steep mountain paths, makes the entire action of that time completely explicable. In the same way, the terrain of the battle of Salamis was also carefully recorded by us. But we paid special attention to Eleusis. The road from Athens there still runs in approximately the same direction as the old sacred road of the festival-goers, which has been uncovered in one place quite intact. On that road we visited the monastery of Daphni with its remarkable Byzantine painting and further the remains of the old sanctuary of Aphrodite. Once you have passed that, you have come out between the hills and you see the plain with the beautiful Saronic sea in front of you. Eleusis has been completely excavated by the Greek archaeological society under the leadership of the learned ephoros Philios: the objects found have been collected for the most part in a simple museum. With a view to my earlier studies on Eleusis, everything was recorded here repeatedly and as accurately as

possible. I collected important material for further studies.

Outside Attica we visited Olympia for a few days, which, as is known, was excavated by the Germans. Nature here is noticeably different from Attica with its picturesque bareness. The landscape here is extremely lovely. It is a pleasant feeling of calm and peace that takes hold of the mind here in one of the holiest places in the Hellenic world. The entire place is surrounded by beautiful green hills, intersected by the gently rippling Alpheios, in which the clear blue sky is reflected. The casts of the sculptures found there are, as is known, in Leiden; they were therefore very well known to us. Of course, the study of the originals became more fruitful because of this. On the excavated site I now had the good fortune to be able to conduct an investigation into questions that had occupied me for a long time and that can only be determined there. Here too I gathered material for new study.

On April 2nd the Institute trip began under the leadership of Prof. Dörpfeld through the Peloponnese. We were allowed to take part in it. Everywhere the ruins were explained to us by that great connoisseur of ancient architecture. First we visited Corinth. The most important thing that remains of the old city are the ruins of a very old Doric temple; at the moment the American school is trying to bring more to light by excavation. From Corinth we went to the beautifully situated Nauplia to undertake several trips from there. We visited the castle of Tiryns, which was excavated at the time by Dörpfeld himself in collaboration with Schliemann, then Mykenai, where first by Schliemann was excavated later by the Greek archaeological society; We then went to the site of the ancient temple of Hera, not far from Mycenae, where the excavations of the American school have brought a few things to light. The excavations of Epidauros by the Greek archaeological society are of exceptional importance. We also visited them from Nauplia [Nauplia]. The famous theatre there is particularly remarkable, the best preserved Greek theatre that we know of, and one that, like most others, has not undergone reconstructions in Roman times. That is why these ruins are so important for our knowledge of the design of the Greek theatre. There are also remains of the famous temple of Asclepius. Of the other ruins, the enigmatic round building in particular attracted our attention, which was built by a certain Polykleitos and is called thumele in the inscriptions; however, its destination is unknown. The journey then continued via Argos to Tripolitza in Arcadia. From there we visited Mantinea, where the French school has dug successfully and, among other things, almost the entire city wall has come to light; we also paid a short visit to Tegea, which, however, since the famous heads of Skopas were found there, has yielded only things of minor importance from its soil. Both Tegea and Mantinea, however, played an important role in Greek history, so that it is very worthwhile to inform oneself of the peculiarity of their location by one's own observation. From Tripolitza we continued through the beautiful Arcadian alpine country to Megalopolis. The road there leads over steep mountain ridges and along bold rock formations; at a few points a view opens up over the vast green plain below with dark mountains and the shining white snow-capped peaks of Taygetos in the distance. Megalopolis is now a miserable little place, where one is reminded by almost nothing of our European civilization. Five minutes from there lie the rather small remains of the old city. The most interesting here is the theatre excavated by the English school; it was adjoined by a large meeting room, the furnishings of which can still be almost recognized, the so-called Thersileon. Furthermore, Olympia was visited on this journey and I considered it a great advantage to hear these ruins explained by Prof. Dörpfeld; for although the results of the German excavations have been published in an impeccable manner, the personal statements of the man who was present as architect at the greater part of these excavations, always have an extraordinary value, not to mention that Prof. Dörpfeld's lectures are unsurpassed in clarity and vivid presentation.

From Olympia we went to Patras. From there by steamer to the beautiful island of Ithaca, from Ithaca to Itea Delphi's harbour. It is probably situated almost on the site of the old Cirrha. The road to Delphi first leads through a slowly rising plain, covered with olive groves. One sees the Delphic mountain country before one, with the white peak of Parnassos rising above it. On the left one comes along the road that leads to the old Amphissa. Soon, however, one ascends along steep mountain roads; one then passes through the village of Chryso, which probably lies on or near the site of the old Krisa. Then one reaches the village of Kastri, the old Delphi. A village of that name was namely on the site of the old sanctuary. This was demolished by the French school and rebuilt a little further on. The temple area lies on a fairly steep slope, artificially levelled, against the almost vertically rising Phaedriades. It has now been completely excavated. Opposite the large sanctuary lies the temple of Athena Pronoia, of which Aeschylus speaks in the beginning of his Eumenides; when

- 70995 that will be exposed, the French excavations will be at an end. The sun-house of the Castalian spring was quite destroyed at an early date; the water now springs forth elsewhere; yet the spot where it stood, a few paces beyond the great sanctuary, is still very well recognizable.
- 71000 Our company left us very soon; we stayed a few more days. On the site of the excavations one obtains a very clear idea of the entire ground plan of this so extensive sanctuary and as in Olympia the buildings mentioned by Pausanias and others could be found almost. It is a pity that not so much of the upright parts of the buildings has survived. The sculpture that was found and only partly published is of the highest importance for the history of art. Almost intact a charioteer has come to light, of extraordinary artistic value, certainly the most excellently preserved bronze statue from antiquity. In its style of art the work is from around 470 before Christ. Pieces of horses and a chariot and of one or two more human figures have been found with it and a limestone slab with an inscription belonging to a pedestal, which must have been that of this votive offering; the one who dedicated it was, according to the inscription, Polyzalos, brother of the Syracusan tyrant Gelo. This discovery means for the excavations of Delphi what that of the Hermes of Praxiteles meant for those of Olympia. The epigraphic discoveries are also extremely important. It is very much to be desired that all the inscriptions found will soon be published.
- 71005 From Delphi we went to Athens, where we stayed a few more days.
- 71010 From Athens we sailed to Constantinople. There we wanted to study both Museums, especially the new one with its famous Sidonian and Klassomenan sarcophagi. The magnificent Aja Sophia was also carefully inspected. Of course we also tried to form a good idea of the city and its location.
- 71015 We went home via Vienna. On 4 May 1898 we returned to Leiden.
- 71020 With this journey I have more than achieved what I had imagined. I hope and expect that my teaching will prove to have gained much from it and that in general the study of classical antiquity at our university will profit from it. What I brought back in terms of new material for study is not unimportant. I assembled a collection of photographs of about 700 pieces. These carefully arranged and provided with an accompanying description now form an excellent aid for study. Furthermore, I had an important collection of paper prints made of well-known Attic inscriptions; together with the original pieces that the Leiden Museum possesses, these will make it possible from now on to prepare for epigraphic studies in Leiden. It was for this that I used the credit that the Leiden University Fund had the goodness to grant me.
- 71030 For the Leiden Museum of Antiquities I also acquired several remarkable pieces of ancient Greek pottery, through which the important vase collection of that Museum was enriched with specimens of some types that it did not possess until now. As for my further special investigations, I hope to be able to publish the results in professional journals before too long; they concern Eleusis and Olympia in particular. It goes without saying that this is not the place for abstract scientific dissertations. The question of the travels of our future literary men is different. It is of immediate practical importance and I do not hesitate to set out my opinion on it in more detail.
- 71035 Foreign countries have done a great deal for the study of antiquity. The Archaeological Institute, a German State institution since 1874, has existed since 1829. The main administration is now located in Berlin. The oldest department is the Roman one; it probably has the most complete archaeological library in the world. In 1874 an Athenian department was also founded. At the Ecole Française in Rome, archaeological studies recede more into the background. Different from that in Athens, which in April of this year – somewhat late as a result of the Greek-Turkish war – celebrated its 50th anniversary. Founded in 1846, it was not originally an institution deliberately and primarily for archaeological studies, but it became more and more so and now it is the most worthy competitor of the German Institute. The English school in Athens was founded in 1882 from private funds. An association of American universities maintains the American school in Athens and has recently founded one in Rome. At the moment they are just busy founding an Austrian Institute with a main administration in Vienna and branches in Athens, Smyrna and Constantinople.
- 71040 The functioning of these institutions is very different. It is in accordance with the nature of university education in each of these countries. It is for this reason that our young scholars will find it most easy to connect with the German and Austrian Institutes. After all, our university institutions and customs correspond most closely to those of those two countries. The hospitality that those various institutions show to foreigners is very great. The German Institute opens its
- 71055

71060 libraries to students of all nations. Access to the lectures that the secretaries of
the German and Austrian Institutes give in the Museums and among the ruins is
obtained without any significant difficulty. The company that takes part in Prof.
Dörpfeld's famous Institute trips usually consists for a very large part of non-
71065 Germans. The Ecole Française in Athens is also very willing to accept students from
countries that do not have Institutes of their own.

It is a few, not many young French, German, Austrian scholars who are enabled by a
State stipend to study for a considerable period under the guidance of their
Institutes in Italy and Greece. Without exception, they are young men who have
71070 completed a university education and have attracted attention in one way or another.
The German scholarship holders arrange their journey entirely as they wish. Of
course, they usually follow the lectures of the secretaries of the Institute, but
their own independent study is the main thing; however, it goes without saying that
the resources of the Institute and the advice and information of the secretaries also
71075 benefit them in this. In addition to the German Reich scholarships, there are also
those from special states and foundations. Quite a few also travel at their own
expense. In addition to the young graduates, one also encounters several
Gymnasiallehrer on the journey, who have been granted leave for a few months,
sometimes with a scholarship into the bargain. In addition, the scholars associated
71080 with the Institute travel with the Gymnasiallehrer for six weeks through Italy in
museums, ruins and necropolises in order to learn the great main points through their
own observation. Austria also has grants for recently graduated archaeologists and
philologists. Many grants for a shorter period are, however, enjoyed by
Gymnasiallehrer. They also travel under the guidance of one of the Austrian
71085 professors of archaeology; many went with the German Institute through the
Peloponnese. From now on, the new Austrian Institute will have to take care of them.
It is understandable that professional archaeologists have a certain priority in all
these journeys. Yet it is of the utmost importance for every classicist to get to
know Italy and Greece through personal observation. Moreover, where is the boundary
71090 between philology and archaeology? How many archaeological questions are not of the
utmost importance for philological research? It is so understandable that so many
German or French philologists alternate their work in libraries with visits to
museums. Even those journeys that are less aimed at the formation of learned
researchers are of great use. That teachers at grammar schools see much and well
71095 without having a specific subject of study in mind, that their minds are broadened by
a number of powerful impressions, how would it not benefit grammar school education?
Yet it goes without saying that some preparatory archaeological education is
absolutely indispensable even for those who do not travel as a professional. Even
without that, one will be able to follow some of the archaeological lectures, one
71100 loses oneself among the ruins and in the immense museums of Italy and Greece, if one
has not acquired some knowledge of art history and especially if one has not acquired
some practice in viewing antique works of art with judgment and discrimination. It is
therefore a well-known fact that grants are sometimes wasted money and likewise that
Italy and Greece are often visited by so-called students, who hardly benefit from
71105 them as much as a cultured tourist. It is also beyond doubt that travelling with a
false pretence of knowledge can very easily have a pernicious influence. Experience
teaches us how easily such unprepared study leads to imaginary knowledge and
confusion of mind.

It goes without saying that when granting travel grants we should take advantage of
the experience acquired elsewhere. In the first place, one should never send someone
who is not at least somewhat prepared. Furthermore, one should ask oneself what the
purpose of the journey will be. If it is to train a scientific researcher, then a
larger grant should be given than if one wants to enable a good student to enliven
and confirm the knowledge of antiquity that he has acquired at the University by his
71115 own observation. For the latter, a few months, even weeks, are sufficient. Here one
runs the risk to give a grant to one person, from whom several could be helped.
Especially the first, the awarding of a stipend to a future researcher, will give
great difficulties. Well-passed examinations do not give the slightest guarantee of
real study-mindedness and in our system of higher education the examination has
71120 acquired a predominant importance. German stipend holders have often already given
proof of their gifts for independent research by some small writing. It would be best
for our relations if we could do for our preceptors and candidates in literature what
Germany and Austria do for their Gymnasiallehrer. They should be allowed to make
archaeological excursions of a few weeks to Italy under the guidance of a
71125 professional; the British Museum could also be visited in this way. Every good

- student could qualify for such trips. The more highly gifted would receive a powerful stimulus for their own study by such a journey, and by hard work, for instance by a dissertation, they would be able to show who they were. For these, after all always relatively few, the necessary money for a scientific journey in the strict sense
- 71130 could of course be collected without great difficulty. Not only archaeologists and epigraphicists, but also philologists should be sent, but the latter would then be excellently prepared for their archaeological studies. Such travellers would naturally find sufficient help and information at the existing écoles and Institutes. The matter of scientific travel is of the utmost importance, and it is fortunate that
- 71135 this is increasingly being recognised. Just as in our trade, in our science we are all too inclined to sit at home. It would be of the utmost importance for our entire national culture if our higher education came under the influence of men with far-reaching vision, completely beyond a certain circle. Not least in art and science, a country like ours can be great according to the royal word. Our ancient fame in
- 71140 classical studies still supports us vis-à-vis foreign countries; however, we have fallen behind because we did not understand the significance of what was done outside our borders. The tendency is increasing to see our grammar schools as vocational schools and our entire education is considered far too exclusively as a means for the individual to seize one or other more or less profitable position in his own
- 71145 interest. People forget that a healthy idealism is a life force for an entire nation, which also steels it in the struggle for its material interests. Our schools must inspire our people to something good and great, and in our grammar schools those men in particular should be formed who in the whole of society have to set the tone in matters of higher spiritual culture. How much greater power could emanate from our
- 71150 teachers at grammar schools if very many had completed their education through a journey made fruitful with judgment, and if a few had been able to develop themselves carefree as independent scholars for a considerable time. For the elevation of the people, the sciences of aesthetics and the history of civilization have a very high significance.
- 71155 I thank the Government for making it possible for me to fulfill my important life's task more worthy.
With respect and esteem
Leiden, Your Excellency obedient servant,
October 1898. A.E.J. Holwerda.

- 71165 Trip to Italy and Greece
December 22, 1897 departure from Leiden
visit Florence 3 days, Rome 4 weeks
February 4, 1898 Brindisi
- 71170 February 7, 1898 Athens
2 months Athens, visit Attica, Eleusis, Olympia
April 2, 1898 Peloponnese
visit Corinth, Nauplia, Epidaurus
Ithaca, Delphi
- 71175 Athens, Constantinople
May 4 1898 via Vienna, arrival in Leiden
- 4 December 1898 **ARTS AND SCIENCES.**
Scientific journey of Dr. Holwerda.
- 71180 Today's St.-Ct. contains the report of Dr. A.E.J. Holwerda, concerning the scientific journey which he, enabled by the Government, made to Italy and Greece, in the company of his son, the doctorandus in classical literature J.H. Holwerda, who was enabled to accompany him by a subsidy from the Van Vollenhoven fund.
As for the result of his journey, the writer says:
- 71185 With this journey I have more than achieved what I had imagined. I hope and expect that my education will prove to have gained much from it and that in the common the study of classical antiquity at our university will benefit from it. Already what I brought back in new material for study is not unimportant. I assembled a collection of photographs of about 700 pieces. These carefully arranged and provided with an
- 71190 accompanying description, now form an excellent aid for study. Furthermore I had an important collection of paper prints made of well-known Attic inscriptions; together

with the original pieces that the Leiden Museum possesses, these will make it possible from now on to prepare for epigraphic studies in Leiden. It was for this that I used the credit that the Leiden University Fund had the goodness to grant me. For the Leiden Museum of Antiquities I also acquired several remarkable pieces of ancient Greek pottery, through which the important vase collection of the Museum was enriched with specimens of some types that it did not possess until now. As for my further special investigations, I hope to be able to publish the results in professional journals in the not too distant future; they concern Eleusis and Olympia in particular. It goes without saying that this is not the place for abstract scientific dissertations.

October 20, 1885 The Guide Cypriot Art.

The Old Cypriots in Art and Culture. Studies by Dr. A.E.J. Holwerda. Leiden, E.J. Brill, 1885.

In a country where, among civilized people, every object adorned with acanthus leaves is still considered Greek in style, but the most unmistakably Attic vases remain Etruscan, where, in matters of archaeology, Schliemann is considered preeminent for the researcher and Overbeck for the scholar, and where the legislative body argues that, since a Limburg brewer has contributed so much to the dissemination of knowledge about the art and customs of antiquity, it is unnecessary for the state to do the most necessary; In a country, in short, that in this respect lags behind neighbors and foreigners, Germans and Austrians, French and English, Russians and Americans, Italians and Greeks, yes, Poles and Turks, by half a century, it is a gratifying phenomenon, a bold act on the part of the author and publisher, even if it is in a foreign language, to send out a booklet exclusively dealing with a remote corner of the vast field of Greek art, which almost every year offers new fields for exploration.

The booklet that prompted this outburst, which I trust the few practitioners of Greek art in our country will not notice, as if it were not aimed at them, is by Dr. A.E.J. Holwerda, equally familiar to the readers of the Gids and those of the Archaeologische Zeitung. Yet, this work is, in a sense, a first, for the treatise in the latter journal, on the games at Olympia, did not, by its very nature, delve into reflections on art, and the articles in the Gids are intended for too broad a readership for the author to claim scholarly significance. Mr. Holwerda addresses complex issues of style and theology in detail, addressing not exclusively colleagues, but nevertheless scholars. Nevertheless, I gladly accept the Gids editors' invitation and venture to draw the reader's attention to the contents of at least part of this research, for the role Cyprus played in the competition between Eastern and Western civilization guarantees us in advance a blend of European and Asian influences in everything it produces, to which the proximity of Egypt can only add even greater significance. From the time of Cinyras, the Phoenician king of Cyprus, who, according to Homer, showed his interest in Agamemnon's expedition to Troy by presenting him with armor, and, according to later tradition, withdrew from promised aid by sending small baked earthen boats and soldiers, a Cypriot commodity still found in tombs; and from the times of Sargon (722-705), Esarhaddon (682-668), and Ashurbanipal (668-626), when Greek princes on Cyprus were already tributary to Assyria, until Alexander opened the entire world to the Greeks, Cyprus has rarely taken a significant part in armed conflict, but has contributed all the more to the spread of religious forms or morality and the arts of peace. And no wonder, a land rich in copper and precious stones, so fertile that it could be compared to Egypt, with such a diversity of riches that it could build and equip a ship from its own materials and products, a land where Greeks and Phoenicians lived side by side for centuries, offered a unique breeding ground for young plants of foreign origin. For although we can unfortunately too rarely prove that the road leads through Cyprus, there are, as Mr. Holwerda's booklet will again demonstrate, phenomena to be observed that leave us no other choice. But the warm air of the greenhouse that develops the seed would cause the tree to wither. Moreover, all the seed sown did not bear equal fruit, no matter how luxuriantly the plant sprouted. Thus, the Cypriot Greeks possessed an alphabet much earlier than their brethren, much like the Japanese, derived from the Chinese, and from Hittite hieroglyphs. But Greece adopted the Phoenician letters and left them in use throughout history. The founder of the Stoic school, Zenon, also grew up in Cyprus. Of Phoenician descent and gifted with Semitic tendencies, he united the lessons of the Greek philosophers into a morality that still exerts its influence, and which lacked only legend and form to become a religion.

Mr. Holwerda's work contains, besides 60 printed pages, 7 lithographic plates based

on other editions and a fairly good photolithograph of two unpublished baked clay figurines from the British Museum, almost all of which serve to illustrate comparison of the second chapter on art, which deserves the lion's share not only in this respect. The first chapter is preceded by a brief description of the two places where the largest number of Cypriot works of art were found, by Hamilton Lang or Louis Palma di Cesnola: Dali (Idalium) and Atheniau (Golgi). Mr. Holwerda believes that these small, walled places, with so many statues, probably dedicated to various gods, were merely sacred gardens, τὸμῶν, in the great τὸμῶς of Aphrodite, where the Christians gathered and buried the useless statues of the pagans. Useless, I add, because if there was any marble, it probably disappeared in the lime kiln, and the bronze, which could not possibly have been missing, was certainly melted. The discovered sculptures are almost without exception made of limestone, a material too easy to work and not sufficiently resistant to the effects of wind and weather. Before we proceed to the discussion of these sculptures, however, it should be noted that in his second chapter, the author first discusses Cypriot vases, places particular emphasis on the makers' adherence to ancient forms and figures, and briefly mentions the crudest terracottas. However, we dare not follow his lead at this point, for since his book was written, the excavation at Naukratis has promised so much new light on precisely these aspects of Cypriot art that, given the brief descriptions published thus far, it would be premature to form a judgment. It is difficult, indeed impossible, to convey in a brief overview both the current view of Cypriot art and that which Mr. Holwerda attempts to introduce, to present his arguments, and, where necessary, to refute them, especially when the difference of opinion, as is often the case, rests on differing appreciations of minor details but stems from differing convictions regarding principles. We will therefore have to confine ourselves to pointing out this difference in conviction and then present our account of the development of Cypriot art, as much as possible using the author's perspective.

Firstly, we believe we should attach more weight than Mr. Holwerda to the history of Cyprus itself in developing that of art. For example, when we encounter a Cypriot ruler in semi-Egyptian attire, it is not indifferent to us to know when Cyprus was conquered by Egypt and how long it remained dependent.

That Mr. Holwerda takes less interest in this can be explained by the second point of contention. We read on pg. 26: "Even the Cypriot kings, for example, have as little of a Shenti as the Phoenicians. All Egyptian robes, crosses, Shentis, and the like are also quite superimposed objects in Cypriot art." We cannot possibly agree with these words, for just as it is natural that Egyptian depictions were imitated with more or less fidelity on Phoenician bronze vessels, perhaps even on Cypriot ones, to supply a sought-after commodity for domestic or foreign trade, it is equally improbable that a ruler would have consecrated his statue of the deity in foreign garments that he did not wear. And these garments are not even purely Egyptian, but, by covering the entire upper body, made suitable for a more northern climate. Does it need further explanation that the Cypriot vassal of the Egyptian was quick to imitate his liege lord's attire, especially when it also indicated his rank and dignity? If we see a king of Holland in a uniform differing only in color from the French, then we can already infer his dependence on the Emperor. If, on the other hand, we find a priest with a Semitic profile, we do not think of an Assyrian style but rather recognize one of those Phoenicians who inhabited a large part of Cyprus.

The third point is no less important. There is something in all art, something called style, that betrays itself to the trained eye at first glance, yet which cannot be expressed in words and can only be made known through images or by comparison with nearly similar art. It is true that small details often influence this impression, and that is precisely the easiest way to name style, but a list of all its peculiarities does not provide style, even if one sometimes makes do. Mr. Holwerda, too, is aware of the difference or similarity in style, but he fears attaching too much importance to it and warns himself and us against general impressions, determining the degree of dependence of an art on others solely by considering minor details.

There are many crudely crafted Cypriot dolls, very long and very narrow, flat at the back, Mr. Holwerda considers them the oldest works of Cypriot sculpture, yet neither free from foreign influence. For some, the possibility of this is undeniable, but it seems likely to me that we are almost always dealing with work no older than the statues we possess, but of the very slightest kind. The resemblance is too great. Of the larger statues, those that appear to be the oldest exhibit some peculiarities that, since their excavation, have led them to be called Assyrian in style. But Mr. Holwerda again clearly demonstrates this: there are only a few points of similarity

here, among which the spirals that imitate the curls of hair and beard occupy a prominent place.

Therefore, however, these beards are not Assyrian beards, and these statues even less so Assyrian statues, but they bear their own unmistakable character, which brings them closer to other ancient Greek art, primarily to Ionian art. Mr. Holwerda attributes these similarities, amidst such great diversity, between Assyrian and Cypriot art to a superficial oversight, and is therefore forced to place these sculptures in the period of Nineveh's heyday. I cannot share this conviction, but prefer to adhere to the assumption that another art served as a mediator.

The author rightly disputes that this art, as one might wish, could be found in Phoenicia, but the vast plains of Syria, which separate Nineveh from Cyprus, have been explored almost as little as the mountains of Cilicia, and we possess almost nothing of the art of the Neo-Babylonian Empire.

The peculiar depiction of the folds of the cloaks, for example, most closely resembles that of some Hittite sculptures on the rocks of Cappadocia. The resemblance to the oldest Greek art, which is evident not only in the hair and beard and in the facial features, but especially in the depiction of those features—the narrow, drawn lips, the strong cheekbones, the sharp corners of the eyes, the broken line of the upper eyelid, and the high eyebrows—seems to me to be greater than Mr. Holwerda believes. Nevertheless, it is an interesting observation that this oldest Greek art was learned more by the Cyprians than the other way around. This cannot yet be proven, and the reason the author offers—the similarity in the application of curls on the forehead—seems insufficient to me, as this occurs too frequently in the oldest Greek sculptures and painted vases to owe its origin to anything other than a faithful imitation of nature. He could just as justifiably cite the resemblance in the shape of the beard, which in both cases is a kind of ring beard, as the upper and lower lips are shaven, precisely in that respect they differ from Assyrian custom. While Greek statues dating from the sixth century remain extremely rare, there seems to be no objection to classifying many Cypriot ones at the beginning of that century, perhaps even a little earlier. These wear long beards, while the Greeks' are short. Gradually, the beard also becomes shorter in Cyprus, apparently around the middle of the sixth century, when Cyprus comes under Egyptian rule (560-525) and the Egyptian uniform is worn. Soon, beardless men also appear, who also wear the Egyptian hairdo of the Saite Empire, and who, unlike earlier Assyrian art, recall Egyptian examples more through the general impression of body shape and the position of the head and limbs, than through details of workmanship. It seems that Naukratis also played a role in this. But by the beginning of the fifth century, Greek art had completely outgrown and grown beyond the reach of the Cypriots, and after the Persian Wars, its influence was felt there as well, albeit moderately, for the Cypriot disposition seems not to permit him to take a higher flight, and he remained at the position he had once attained. The new direction is most noticeable in the treatment of robes. It is also noteworthy that the Cyprians, like the Greeks, perhaps both under Persian influence, now grew full beards. Perhaps religious reasons also contributed to the adherence to the forms once adopted, but it is certain that a large portion of the discovered sculptures, which seem old to the untrained observer, are from later periods, even later than Mr. Holwerda assumes, who argues that Cypriot art gave way to Hellenistic art in the fourth century; the last traces, after all, can still be found in a sculpture that clearly dates from Roman times. In the palaces of princes such as Euagoras and Nicocles, no more than later at the court in Alexandria, Greek masterpieces will be found and have been lacking, and remnants of Hellenistic art are also found, but just as in Ptolemaic Egypt, sacred art in Cyprus preserved its indigenous features and produced images very peculiar in appearance, yet a forbidding example for all art that seeks to perpetuate or revive outdated forms.

In the third chapter, Mr. Holwerda discusses a bronze bowl found in Idalium, of Cypriot make, depicting a sacrifice to Aphrodite with song and dance. He connects this depiction with the ancient custom of dedicating statues or entire groups of statues in sacrificial poses as a lasting reminder of the sacrifice, or rather as a perpetual offering.

With no less wealth of examples, the author argues in the following chapter that the statues of the victors in the games, and those of consecrated priests, were also donated to the deity for the same reason. It is only with hesitation that I proceed to mention the final chapter, in which Mr. Holwerda attempts to demonstrate that although the Aphrodite we know is the Semitic Astarte, who came to Greece as Cypris via Cyprus, she was nevertheless identified there with an Indo-European cloud goddess, whom she has so displaced that we only find traces of the ancient tradition here and there. Anyone wishing to see this proposition further elucidated should read

- 71390 Mr. Holwerda's booklet; I readily admit that I do not consider myself capable of judging this point; after all, everything depends on the greater or lesser value one attaches to one tradition or another and on the credence given to the assertions of Philo Byblius, for example, or to the arguments of Kuhn. I cannot resist one observation, however: it seems to me almost as dangerous to use the legends of Thebes, the city of Phoenician tradition par excellence, as a source for Indo-European theology as to attempt to draw folklore from the tragedians.
- 71395 However this may be, and however much the author in the second chapter—the most important, as I said—seems to have failed to prove that in the building, erected by others from existing ruins, the cornice has become the foundation and the column shafts are upside down, he has nevertheless likely here and there reduced a pretended metope to a fragment of the frieze, or assigned what was considered an acroterium its place in the facade, and in any case, raised an important question: THE PROBABLE DEPENDENCE OF THE OLDEST GREEK ART ON CYPRUS. - January 1, 1881 The Guide Olympia.
Ausgrabungen zu Olympia von E. Curtius u.a. I-IV. Berlin, Wasmuth.
Archaeologische Zeitung, Year 1875-80.
- 71425 I.
In Pausanias, a writer from the first half of the second century AD, from whom we possess a travelogue of Greece, we read, among other things, the following story. Timanthes of Kleonae had been a famous champion fighter and victor in the Olympic games in his youth. As he grew older, he no longer competed in the wrestling arena, but, still eager to test his strength, he drew a large bow every day. After some time, he went on a journey, and naturally, these daily exercises were neglected. Returning home, however, he immediately picked up his bow again, but no matter what he did, he could not pull the string. This was too much for him; he built himself a funeral pyre; life no longer held any value for him. Such stories—true or fictional—clearly show us the important place the wrestling arena occupied in the life of the Hellenic people. Wherever Greeks lived, from Sicily to the Black Sea, there were hippodromes and schools for physical exercise, and they were free Hellenes, who, in their fresh zest for life, felt the need to measure their strength against one another, and to strive to prepare for a public contest; the respectable Roman, accustomed to the games of the gladiators, later wondered why such performances were also considered appropriate for a free citizen. For the Greek, however, the race and wrestling were something more than public entertainment. The great games, at least, also called "sacred"—those of Olympia, Nemea, those of the Pythian Apollo, and those of the Isthmus of Corinth—were therefore not so much an addition—a kind of relaxation after the seriousness—to the other ceremonies of the religious festival to which they belonged, but rather a coherent whole, and a part of the worship of God itself. It was under the gaze of the immortal Gods that the Greek strove for the highest goal of life in these contests and sought to unfold the glories of human existence—beauty, wealth, and strength—in their full splendor.
- 71430 He himself, with his deep sense of what distinguished him from the barbarians, was well aware of how much was unique in his public games. He believes he perceives this particularly Hellenic character in two particular instances. When the Persian army had penetrated Thermopylae and the torch of war was drawing ever closer to Greece proper, a few Arcadian deserters came to the Persians—as Herodotus tells us. [This sentence appears to be incomplete and should be omitted.] Brought before the king,

these men replied, in response to the question: "What were the Hellenes doing at that moment?", that they were holding their contests at Olympia, and in response to a second question: "What was the contest prize?", that they were competing for a crown of olive leaves. Then Tritantaichmes, one of the king's most moderate counselors, said to Mardonius, the principal organizer of the war: "Against whom, Mardonius, have you led us to war? Men who hold a contest not for money but for masculine virtue!"

Here the Greek folktale strikingly puts the appreciation of a characteristic Greek folk custom in the mouth of the Asian. Another peculiarity of Greek folklore is pointed out to us in plain terms by the second great historian of Greece, Thucydides. He tells us that in the early days, the champions at Olympia wore a girdle around their hips, but that after a few years all clothing was abolished during the contest. "There are also," Thucydides continues, "barbarians, especially the Asiatics, who set prizes for boxing and wrestling, and they also use a belt for this." The complete nakedness of the fighters was therefore also something truly Hellenic. Thus, we are already led by the Hellenes themselves to seek the uniqueness of their national character primarily in their national games, and when the same Thucydides follows up the quoted words with this observation that "there are also many other things in which, as one could demonstrate, the way of life of the earlier Hellenes was in harmony with that of the barbarians of his own time," it is also a Hellene who points out to us that here too, the uniquely Hellenic character gradually emerged, as it were, from a background of originally greater similarity with the barbarians, and that, therefore, if we wish to understand it in its true meaning, we can do no better than consult history. The first part of this essay is devoted to following up on this suggestion.

On both sides of the Aegean Sea, in Greece and western Asia Minor, various Indo-Germanic tribes have lived since ancient times, most of whom we can, without being too inaccurate, group under the Greek name of Pelasgians. These Pelasgians could be called the raw material from which the various Hellenic peoples formed, as if by secession, and it was the same barbarians from whom they would later distinguish themselves so much who, at least for most of them, gave the initial impetus. Through intercourse with Eastern peoples, the Asia Minor tribes were the first to be elevated to higher civilization; as we hear mention of very early on Egyptian monuments by Jonians. Subsequently, through that same contact with the East, and to an even greater extent through the colonization of the already more advanced relatives from Asia Minor, the Pelasgians of the islands and Europe were shaken from their slumber. There, too, one hears mention of Ionians, but equally of Aeolians and Achaeans; these are the names of Pelasgian tribes that had risen to a higher civilization. This elevation of Pelasgians to Ionians, Aeolians, or Achaeans will likely have occurred in approximately the following way: a small core of more civilized people—foreign colonists or natives, who, through intercourse with foreigners, had become more highly developed — living in a Pelasgian land, mostly on the coast, gradually expanded in all directions, and more and more Pelasgians, with or without force, were won over to the new situation.

However, the development of true Hellenism did not originate primarily with the Ionians, Achaeans, or Aeolians. It was, to a greater extent, the work of another tribe, the Dorians, who originally lived in the mountains of southern Thessaly and certainly felt the influence of foreign civilization much less in earlier times. Thus, these Dorians provide us with proof that when one speaks of the elevation of a tribe to higher development, in addition to external influences, certain internal forces are also at work, which we cannot explain further than by calling them, for example, "original disposition." One might even argue that the Dorians became the predecessors of the Hellenes precisely because their lesser contact with the East made it easier for them to preserve that original disposition in all its purity. Thucydides' statement that Hellenes and barbarians were homogeneous from ancient times is therefore only true insofar as their dissimilarity only emerged in clear outlines over time.

These Dorians changed their residence several times; Thessaly was in a period of turmoil: the various tribes displaced one another. The Dorians, who first lived in the south of the country, are later found entirely in the north, then again in the south, until finally, driven by a desire for illustrious deeds, they penetrated through the mountains of Thessaly into Central Greece and settled there not far from Mount Parnassus.

Already here they gave great proof of their sense of organization. The various Greek tribes, although constantly warring among themselves in ancient times, could not, in

the long run, close their eyes to what they had in common as tribal brothers. Early on, we see peoples living in each other's neighborhood uniting to care for a common sanctuary: one people, one God. Nevertheless, they continued to fight each other even afterward, but the groundwork for a more peaceful situation had been laid. The Dorians took a major step forward in this direction. It was likely under their influence that three such unions united into one large one, the Amphictiony of Delphi, so that from then on, numerous peoples, from northern Thessaly to the Gulf of Corinth, found their religious and more or less also their political center in the temple of Delphi on Parnassus. But Central Greece ultimately offered the Dorians neither the lands they needed nor a sufficiently large field for their exploits. Their eyes had long been fixed on the Peloponnese, the southern peninsula of Greece. There, on the eastern and northern coasts, lived a fairly large Ionian population, who, long associated with the East, not only practiced agriculture but also traded and had even made some progress in arts and crafts. While on the western coast, Aeolian and Achaean colonies had penetrated only very slightly into the Pelasgian interior. In the Ionian territory, here and there, formidable fortresses were found, with walls as thick as 25 feet, constructed of colossal boulders hewn from the mountains. One of these citadels, the one at Mycenae, had an entrance formed by two parallel walls, 50 feet long, at the end of which was a gate, 15 feet wide, above which were carved stone statues of two lions, facing each other, presumably the heraldic emblem of a renowned heroic family. The Achaean rulers lived in these citadels, for Achaean colonists had settled among the Ionians in the Peloponnese and gradually acquired power there. The rulers of the Peloponnese were called Achaeans, and although some of them were not originally Achaean families, this did not prevent the name from being extended to all. A certain connection existed between the Achaean families—there were also some outside the Peloponnese; How much did the later legend recount of Agamemnon of the Atreidae family, the lord of Mycenae, who led so many Achaeans against mighty Troy? Yet it is understandable that no communal bond was strong enough to ultimately restrain the wild passions of a savage knightly aristocracy. People plundered each other's herds and slaves; numerous feuds divided the various families from generation to generation. No trace of a struggle over anything one might call a political or religious issue! Conditions were not entirely dissimilar to those of Europe in the first century.

In the time of the feudal system; even in Achaean Greece, despite the disagreements between great and small lords, a regular social situation and generally recognized authority were impossible. Very little evidence remains of later Hellenic republicanism. While the princes and prominent Achaeans were exhorted to their duty "with friendly words," the vast mass of the lower ranks, driven by the royal rod, had to endure the scornful rebuke that they were "unfightable and cowardly men, of no account in either war or council, who had only to listen to what others, far more excellent than themselves, had to say." It certainly meant something that they were at least admitted to meetings with the princes. Yet, that vast throng merely formed the dark background against which the heroic figures of the princes could be more clearly defined. What in this Achaean civilization—which we can form a fairly clear picture of through Homer and the ruins of Mycenae—is particularly reminiscent of later times, for example, is that need for splendor, which already testifies to a certain extent to a developed sense of beauty, and also that apparent predilection for holding contests, in which kings and nobles tried to win the prize—a cauldron, a tripod, a horse, an ox, or a slave—not only in horse races, but also by wrestling and throwing discus or javelin. Such were the social conditions in the land where, more than a thousand years before Christ, the Dorians emerged as conquerors. The fame of the Achaean rulers had also penetrated the valleys of Parnassus, and the powerful sons of the mountains, who felt no need of fortresses as a defense, felt drawn to such a camp. Accompanied by many Aetolian warriors, their western neighbors, and led by the descendants of their tribal hero Heracles, the majority—the rest remaining at their old homes—crossed the Gulf of Corinth where it narrows most, carved their way through the still predominantly Pelasgian inland, and, heading straight for their goal, attacked the illustrious descendants of Atreus in their formidable citadels in the south and east of the peninsula. A stubborn struggle ensued. With incredible effort, they succeeded in gaining a foothold at a few points, from which it would later be possible to penetrate further into the country. Ultimately, they acquired a sufficiently dominant position among the Peloponnesian peoples, from which they established a higher order of things and a more ideal view of life among the Achaeans and later far beyond. The question becomes: who were the Dorians to be capable of such a task? And we will

attempt to form as clear a picture as possible of the peculiarities of their
 71590 spiritual life. That these peculiarities were already present in their main features
 when they set foot on Peloponnesian soil is beyond doubt; yet it is utterly
 impossible here to draw even an approximate boundary between what was present earlier
 and what developed later. We must, therefore, more or less step outside the
 71595 historical order and describe and explain the Dorian peculiarities in the fuller
 scope and with the colors of a later period.
 The higher life of a people often begins with conquest. It then feels powerful and
 great, and cannot remain inactive. How could strength and greatness exist without
 others having to bow to it? Base passions can still play a major role in the warrior,
 but above all, he wants to conquer for the sake of conquering. Self-esteem rises to
 71600 astonishing heights, yet one also carries within oneself a world of social,
 political, or religious order, through which one feels that one, as a people,
 matters. Most so-called world empires are, to a greater or lesser extent, new
 organizations, and the conqueror often, even where he does not originally intend it,
 nevertheless ingrains the peculiarities of his national existence in the land of the
 71605 conquered.
 Such conquests were those of the Egyptians, Assyrians, and Persians; such were also
 those of the Dorian tribe. Yet, although the general fundamental character is the
 same, it is precisely here that the uniquely Hellenic element begins to reveal
 itself. Egyptians, Assyrians, and Persians exalted themselves in the one ruler who
 71610 had placed himself at their head; they identified themselves with his glory,
 reverently awaiting the wealth and splendor that would descend upon them from his
 hands. It was quite different with the Dorians; there everything is on a much smaller
 scale, but there the individual also comes much more into the picture.
 71615 in the foreground. The elevation of the Dorian tribe was simultaneously an elevation
 for each individual Dorian; the nation's ideal of life, at the same time the ideal of
 life for its members: as a human being, too, the Dorian's highest purpose in life was
 to be strong and to make his strength felt by others; in the consciousness of having
 conquered, he also found his highest satisfaction as a human being. If he called
 71620 himself the man in his imagination—a more ideal conception of life for a woman was
 almost unthinkable here—the man as he truly had to be, then it was the warrior; as
 "nailed to the ground," the Dorian had to remain standing amidst his enemies, "teeth
 clenched on his lips, drilling the mighty spear," "never deviating from the javelins
 of his enemies"; Or else he had to leap upon the enemy with sword in hand, 'placing
 71625 his foot beside the enemy's foot,' 'pushing the shield against the enemy's shield,'
 'the helmet toward the enemy's helmet,' 'chest to chest.' One senses how strongly, in
 this representation of the paragon of humanity, that sense of beauty, the most
 inalienable heritage of the Hellenic race, could assert itself. The warrior, who
 unwaveringly brandishes his spear amidst his enemies, is undeniably a figure that
 71630 appeals to the imagination; he can stand in a pose full of dramatic power, with every
 muscle in his body, as it were, working toward the one great goal. The Dorian went
 even further. "Deformed," he said, "it was that an old man lay before the young men
 among the champions, with a gray head and a white beard, breathing out his brave
 breath, holding his bloodied limbs in his hands, his body bare"; the youth, on the
 71635 other hand, is in good health, "as long as he still enjoys the glorious blossoms of
 youth, he is delightful to look upon for men, lovely to women, both when he is alive
 and when he falls in the midst of his enemies in all his splendor." It becomes
 understandable why the Greek could later tolerate no clothing, however named, in the
 wrestling arena. One senses something of that unspeakable pleasure with which he
 71640 could delight in the sight of beauty and youth. Male virtue was not only something
 excellent, it was also something beautiful; "Beautiful and good" remained the great
 precept of Hellenic morality, even in a time when the concept of moral good had a
 much broader scope than originally held by the Dorian.
 And the reward of victory? One demands for oneself a good field and civil prosperity,
 71645 one dreads being prey to necessity, one desires a respected position, which is
 impossible without a certain degree of prosperity; here too, the influence of the
 principle of beauty manifests itself: misery, which nevertheless manifests itself
 externally, "brings shame to the glorious human form"; but however much one therefore
 did not disdain the material advantage that a victory could bring in many cases,
 71650 greed is by no means the true driving force for the struggle. People desired, first
 and foremost, the bliss of victory for its own sake, and as the highest reward,
 should one fall in battle, the assurance that the fame of the brave would live on for
 posterity, and, should one survive, the honor one acquires from young and old, that
 one "shines among one's fellow citizens," that even "elders make room in gatherings."

71655 Thus, the Dorian, in his quest for glory, remained truly human, and the fear of the
excessive—a characteristic consequence of the Greek sense of beauty—is also evident
here. If, for example, the Egyptian kings readily allow themselves to be called God,
one should not forget that such a conception is quite compatible with the theological
71660 concepts of the Egyptians, yet it nevertheless entails a self-aggrandizement, the
danger of which the Greek could easily demonstrate through numerous examples from his
fable: the gods punish the mortal who seeks to equate himself with them. It is
therefore natural that, where victory is presented as the result of the cooperation
of many, the sense of triumph must be lower than where the efforts of thousands are
71665 absorbed by that of one person. That Ramesses the Great performed miracles of bravery
in the Battle of Kodesh, while many Egyptians, on the other hand, behaved cowardly,
no one doubts; that he achieved victory all by himself—as we are assured on the
pylons of Karnak—and defeated "hundreds of thousands" is something no one will take
literally.

But although the Dorian was a born republican, although his kings were probably
71670 little more than Germanic dukes, although every Dorian warrior demanded a great deal
of respect for himself, yet he felt no danger of falling into the trap of his
Germanic brethren, for whom, as is well known, a love of freedom and respect for
personal independence all too often resulted in a certain impotence in political
organization. How could this also be the case among the Dorians, the people who, more
71675 than 1,100 years before Christ, established the Amphictionia of Delphi? A people
whose legends recounted a king, Aegimidius, who, even in the distant past, gave his
tribe firm orders? A people, ultimately, where, as we have noted, the aspirations of
individual individuals so completely harmonized with those of the entire nation. For
71680 them, the state was a union of harmoniously cooperating members, and the widely
renowned Dorian Eunomia ("good legal regulation")—"the Eunomia, the sister," as the
poet later sang, "of Right, the solid foundation of states, and also the sister of
peace, all three creators of wealth, and glorious children of well-advised Justice"—
this Dorian Eunomia was the guardian of this harmonious cooperation.

Such was the Dorian, or rather, such was his nature increasingly over time. One
71685 senses how much further removed he was from the Asiatics than the Achaeans. True,
instead of the single, unimpeded monarch, the latter had a fairly numerous feudal
nobility, whose heroic figures stood side by side as equals, but even so, he was
still very far removed from the Dorian conception of struggle as the ideal life goal
for every warrior, from Dorian republicanism and Dorian Eunomia. No wonder,
71690 therefore, that the triumph of these principles in the not yet even universally
Achaean Peloponnese was achieved only gradually. Relatively soon, the Dorians founded
several states: Sicyon, Corinth, Megara, Argos in the Ionian eastern half of the
Peloponnese, Laconia in the south, Messenia in the southwest, while in western Elis
the Aetolians settled. After that, another period of relative stagnation followed. In
71695 Messenia, the Dorian seeds were all but suffocated: the Dorians there almost
disappeared beneath the large, still half-and-half Pelasgian, population. In the
eastern Ionian lands, they faced an already relatively highly developed civilization,
which, while lacking the ideal fundamental character of their own, nevertheless found
itself disregarded by the Dorians in its most just demands. The efforts of these
71700 Ionians were focused on trade and industry, their civilization largely the result of
their need for material prosperity. The Dorian, averse to all commerce, was unable to
recognize the right to material development, and therefore also unable to control
that Ionian life. The Eurotas situation was especially dire. There, in Laconia, the
Dorian colony was too strong to be relegated to a more modest position, not strong
71705 enough to dominate. A state of constant conflict between the old and new inhabitants
of the land resulted. A truly regular state did not yet exist.

It seemed that Dorian idealism would perish without a trace; it remained questionable
whether a true Hellenism would ever rise against the barbarian world. It was then
that the great legislator Lycurgus appeared among the Spartans, the Dorians of
71710 Eurotas. Through wise laws, he brought the old and the new population into a peaceful
relationship with each other; he ensured order and tranquility, the Dorian Eunomia.
Strict regulations were established to ensure that the Dorians maintained and
developed their unique characteristics: preparation for war became a lifelong task,
71715 the desire for enrichment was excluded by the ban on trade, each was allocated a
sufficient field, but no more than that; each Dorian was given a position worthy of a
freeman before the kings and other heads of state.

Thus, Laconia became Dorian for good, and they felt called upon to bravely enter the
fray, in order to ensure the Dorian spirit prevailed beyond the borders. Messenia,
the land that had become half-Pelasgian again, was reconquered; Spartan warriors, for
71720 whom there were no fields at home, were given them in Messenia. While the resulting

tremendous tensions deeply shook their own household, the Dorians sought strength in their own principles. As a result of the Messenian War, in which the kings had rendered great service, their authority threatened to expand excessively. The power of the Ephors, however, was then increased to ensure the perpetual exclusive rule of law against the kings. And not only this, they even had the courage to somewhat defy their principles. Terpander from Lesbos had to be shaken by his music, in the soul, by the internal strife that had been exalted and harmonious mood, where a direction toward the higher seemed only possible, and Thaletas was called from Crete to impart a higher inspiration to the young men in their military and gymnastic exercises through his flute playing.

Yet, one thing could not be denied in all this. Without war, the Dorian could not achieve his ideal in life, and the question became how the Dorian Eunomia, a regulated legal state, would ever become the peninsula's heritage. It was therefore necessary to discover a haven of peace, where the pursuit of the glory of male virtue could achieve a similar satisfaction as on the battlefield. It was the allies and kindred spirits of the Dorians, the Aetolians, who deserve the honor of having found such a haven. What a memorable juncture in human history; the first more or less conscious attempt by the human race to rid itself of the demon of war! The Aetolians, as we have already noted, had settled on the west coast in the region of Elis. The Aeolian and Achaean tribes who lived on that west coast—as has already been pointed out—had not yet penetrated equally far into the interior everywhere and had apparently exerted little influence on the original population here and there. In Elis, too, the population was probably still in a state of more or less Pelasgian civilization; they were still largely dispersed throughout the country; centers of communication, cities, were still very few. Especially south of Elis, however, at the mouth of the Alpheios, the civilized coastal strip was particularly narrow; beyond it lay the Pelasgian land, which in all likelihood remained almost entirely free of all Achaean or Aeolian civilization. It is noteworthy that the Aetolians, themselves powerless to do more than they were already doing, summoned several Achaean families, displaced from elsewhere, to lead them to a region where the very foundations for a higher order of things still had to be laid.

The natural route to penetrate from the narrow, more civilized coastal region to the Pelasgians was along the banks of the Alpheios, present-day Rufias, a river approximately 180 feet wide, which, after bursting from the high mountains of the far interior, Arcadia, flows its yellow waters along the northern edge of a much lower mountain range in a very winding bed. As one traveled further inland along the river's flatter northern side, one saw the northern hills, having once approached the river but then retreated again, extend far south again, sending out a low, westward-facing range of hills, as they approached the river, at a bend to the north.

Continuing further over these hills, as soon as one reached a peak, a lovely landscape suddenly spread out before the viewer in tranquil splendor. The northern hill country (later named Olympus in this area) continued here at a relatively short distance from the river, so that between them a fairly narrow plain stretched eastward. However, further east, the northern hills approached the river even closer, extending even a single conical peak right up to the bank. Moreover, since the southern hills, the highest of all, did not deviate from the river at any point, the entire plain was enclosed on all sides. Behind them, on the east and southeast sides, rose in a dim distance the higher mountains of the land lying deeper inland, and everywhere the peaks were covered with a soft green, over which, in various places, groves of graceful pine trees, interspersed with a few solemn oaks, cast their shadow. The plain below was completely covered with an olive grove, interrupted here and there by a larger or smaller extension of the northern hills. The largest of these extensions was a fairly steep, also densely wooded hilltop, which, near the eastern end of the western range of hills overlooking the plain, jutted out quite far into the olive grove; this hill was later called Mount Kronos. Another break formed a small stream in the distance, near the eastern summit of the cone, whose waters could perhaps be seen here and there, glistening through the trees. Close ahead was a much more important stream, already then, or only later, called the Kladeos. Just past the eastern end of the range of hills they had climbed, west of what would later become Mount Kronos, it broke out of the northern hills and, sinking deeply between its rather steep banks, made its way to the Alpheios. The whole scene was one of peace and tranquility, often interrupted, however, by that often turbulent main stream, which, enclosed on the south side by much steeper banks than on the north, drove its mighty waters, often swollen by sudden inflows from the interior, between the trees of the olive groves to the foot of the northern hills.

But then, right at the foot of that jutting hilltop, of that later mountain of

Kronos, immediately beside the watery stream from the north, the eye could perceive yet another break in the olive grove. This one, however, was clearly made by human hands. The forest had been cleared here over a considerable expanse, and perhaps with a little effort one could also make out the tall fire altar, which, rising from the center of that open plain, stood out with greater or lesser clarity against the greenery behind it. Before them stood a sacred grove of Pelasgians. The divine spirit murmured through the olive grove; higher beings hovered over the surrounding mountains. How one breathes here as if in the Indo-Germanic atmosphere! As yet, the Deity had not created a dwelling by human hands, but the smoke rising from the high fire altar climbed upward, to the shining heavens, to the boundless light where the Unknown One had established his seat, to Zeus, the father of all that lives. How the men at the summit of that altar felt, as they gazed more freely into the vast expanse of the world, as if brought into closer communion with the Deity! Below, at the foot, hundreds stood absorbed in silent attention, waiting until the sacrificer would finally descend to reveal to the people the will of the Deity, drawn from the ashes of the sacrificial animal. Here was the place where the Pelasgic tribes, perhaps even from further afield, experienced their most sacred moments; here, too, the place whose solemn silence would be broken centuries later by the joyful cries of supreme earthly bliss. Those who saw the long, wooded plain stretched out before them could little have imagined that there, around that same fire altar, the buildings of Olympia, the most magnificent sanctuary of later generations, would one day rise. It was to this region, situated only a few miles from the coast, that the Achaean allies of the Aetohans advanced. On the promontory that enclosed the plain with the sacred grove on the east side, a fortress or city called Pisa was founded, or an existing one was conquered. Soon, other cities arose. According to the idea that the owner of the land should be the owner of the sanctuaries, it was deemed advisable to secure the sacred grove in particular, and the Achaean fortress of Pisa, there on the hill, served primarily to maintain possession of that property. It would not have taken long for the king and queen of heaven to obtain residences. In a truly conservative spirit, the old Pelasgian fire altar was left in its place, but the establishments of a new civilization were placed alongside it: a temple of Hera on the north side, and one of Zeus himself on the south. They believed they worshipped the same gods as the Pelasgians, and there was no thought of abolishing the old cult. Their only desire was to expand it, and little was there any awareness of how much this, too, would lead to a complete reversal. To a great extent, this religious harmony, this reverence among the Achaeans for the Pelasgian sanctuaries, made the dominion of the land easier. When the Pelasgian people returned to their old sanctuary—and the more they did, the more agreeable it must have been for the Achaeans—they certainly found many new things there, but the old fire altar was still there; indeed, it had remained the center of worship. So, despite all the new things, they gradually began to feel completely at home again in the old place, and, as was natural, they also became increasingly accustomed to that newness. Thus, right in the heart of their former civilization, they were won over to a new order of things. Yet, understandably, all this did not happen without a hard struggle. The later legend, at least, which naturally places the events in a much earlier period, tells how in the land of Pisa in ancient times lived a ferocious king, Oenomaos, who had a beautiful daughter named Hippodameia. He wanted to marry this daughter to the one who would have defeated him in a chariot race. Thirteen tried in vain, thirteen were pierced by the victor, and their skulls, truly cannibalistic, were hung on the temple of Oenomaos' father. Then, across the western sea, comes Pelops, the tribal hero of the Achaeans. With deep reverence, he implores Poseidon for help in the difficult battle. Poseidon provides him a golden chariot and winged horses. The race begins. Hippodameia's wishes are on the young man's side. Myrtilos, Oenomaos' charioteer, thrusts a wax pin into the chariot. It crashes down. Pelops is victorious, kills Oenomaos, and obtains his daughter and his kingdom. This legend, strongly reminiscent of several ancient Germanic stories—several Grimm's fairy tales—was truly popular among the later inhabitants of Pisa. People pointed out not only Oenomaos's tomb and stables, but also the shared grave of the thirteen unfortunate suitors, and even that of one of their horses. Centuries later, in the sacred precincts of Olympia, south of the fire altar, under a small roof, stood an old wooden column, which would have collapsed had it not been enclosed by strong bands. People told each other that Oenomaos's house had been destroyed by Zeus's lightning, and that this column alone remained. The Pelasgian sanctuary became Achaean, but the Aetolians also exerted their influence here. It seems that something resembling an Amphictionian bond existed between the two peoples regarding the sacred area—soon called Olympia, while the northern hills were given the name Olympus. Every five years, a garment was

presented to Hera, made by sixteen women from sixteen cities: eight Elian, eight Pisan. The sanctuary likely gained increasing renown among the surrounding tribes; it is plausible that even then a race of youths was held in honor of Zeus, and one of young girls in honor of Hera.

This remained the case for a few centuries. The population on the west coast of the Peloponnese certainly took a great step forward; Yet it goes without saying that a state of civilization, which could only have been established with the help of the Achaeans, had remained so largely Achaean that even here the Dorian Eunomia had not yet subdued Achaean rule; in Elis, the same question was faced to a greater or lesser extent as in Laconia. There Lycurgus arose, and that powerful Dorian movement was awakened, which was destined, in earlier or later times, to seize upon all related peoples. The Aetolians—or let us rather say Eleans, for although the ruling families in Elis were undoubtedly Aetolian, that name no longer appears here as a national name—the Aetolian Eleans then felt the shock very quickly and cooperated vigorously, albeit in their own way. They broke away from the Pisans and deprived them of their common sanctuary in order to govern the whole according to their own views. Every fourth year, the month in which the summer solstice falls (in our country, it falls on June 21st) was to be a "sacred month." Throughout the Elean region, and subsequently among other peoples—in later times, increasingly numerous—a truce (ekecheria, literally: that one should "keep one's hands to oneself") was proclaimed for that month by "messengers of peace," as if it were a truce decreed by the gods. Almost 1,000 years later, a round disk was displayed in the temple of Hera, along the edge of which King Iphitos, to whom the legends unanimously attribute the introduction of this Olympian peace, had its provisions inscribed. Elis was then sacred territory. Festive embassies from states, as well as private individuals, could attend the sacrificial ceremonies without any danger to any enemy and could participate in or be spectators at the subsequent races. Soldiers who wished to cross the Holy Land at such a time were required to surrender their weapons to one side, only to receive them back from the other upon leaving the country.

What a sublime thought of peace in this! The deity himself intervenes to compel the savage, whose wild fist spared nothing, at least for a moment, to "stay his hands" and elevate his spirit to something higher. Iphitos, or whoever he may have been, certainly had his own people in mind first and foremost in his decree, but isn't this precisely the blessing associated with noble thoughts, that they reach further than the one in whose mind they originated could initially clearly imagine? The peaceful mood of Olympia exerted its purifying influence far beyond the borders of Elis; carried far and wide by the numerous celebrators to all corners of Hellenic land. The ancients themselves also noted that there was a very great reconciling power in gathering together for the same purpose in common sanctuaries. Later, the Olympian god refused to give anyone oracles about a war between Greeks.

But it couldn't be long before people had to arrive at that other great idea, in which Olympia's peace above all the lovable meaning was that one can "just as well in competition as in war, share in glorious fame, the praise of fellow citizens and foreigners, the highest attainable gain"; the thought, in a word, that just as well as the Spartan on the battlefield, one could also fight here for "manly virtue." With what a different eye is the camp site next to the temple buildings of Olympia viewed today. There, too, the Dorian could achieve his highest ideal in life; there, too, the glorious "Victory" (Nike) descended from the hand of Zeus, the formidable one; there, too, the victor's breast flowed with that exalting, cleansing feeling of satisfaction that is the portion of everyone who, through the exertion of all their strength, has achieved what is highest for them. It was 28 years after the new regulations by Iphitos that the custom was introduced at Olympia of rewarding the victors with nothing more than a simple olive wreath. From then on, the competition would be for a higher "gain" than a horse, tripod, or cauldron, or whatever precious objects might previously have been the prize of victory. The competition after the sacrificial ceremonies, which had consisted of only a single type of footrace, now assumed increasing importance. Two new types of footrace were soon added, but even then, the competition remained far below its significance. A major step forward was the introduction of wrestling and boxing, and the so-called pankration; these exercises, with their more martial character, were very appropriate for a camp that was to replace the battlefield. More than a hundred years after the introduction of the wreath, the types of competition at Olympia already showed great diversity.

The fighting on the campfire at Olympia had then become Dorian. Another 28 years after the introduction of the wreath, in the year 720, complete nudity was introduced to the competition. Here, if anywhere, one could enjoy the beauty of male virtue. That entire circle of spectators on those heights, surrounding the fighting site,

71920 "worked" as if "alongside" in the fight, and with breathless effort, they followed every muscular movement of their completely naked bodies. Now, a javelin would suddenly tremble right into the target; then, a discus would arc through the air, far beyond the point where all the discus thrown had landed; the entire surrounding crowd involuntarily became engulfed in a movement that echoed through its ranks. What
 71925 enthusiasm permeated all hearts as that youth, "in the full bloom of youth," "though having done beautiful things," strode freely and proudly past the spectators, and, in the rapture of his victory, made the camp resound with his triumphant cries. For many, there was something else special. While, according to Dorian principles, fame among his fellow citizens was the highest reward for every warrior, conversely, every lineage, every city, prided itself on possessing a victor; it later happened
 71930 that a victor would be bribed to be proclaimed a member of a different lineage, or a citizen of a different city, than the one to which he actually belonged. In this identification of the victor's fame with that of his city and his lineage, however, we also see here the measured manifestation that, as we noted, characterized the Greek in all things, as well as in his consciousness of victory. When, in later
 71935 times, the victor allows a triumphal poet like Pindar to clarify the sentiments that inspire him, then the consciousness in which he feels happy is above all that he has worthily perpetuated the glory of country, city, or family. Here too, the striving of individuals is in harmonious harmony with that of the community, and while people often felt the barbarian awakening within, they were fully aware of this danger and
 71940 quickly recalled this vain attempt to "become God," never forgetting that "only the mortal is in the measure of mortals."
 But if the Olympian victor stood worthy beside a glorious ancestor, he too, in turn, was entitled to the tribute of posterity, to that tribute which, as we have seen, was the greatest consolation even for the Spartan warrior when he fell in battle. A
 71945 victor at Olympia is entitled to a song of triumph, which will convey his glory to distant generations. Just as it is painful for a man that his wealth is not linked to his name if he has no son to succeed him, so too is happiness very short-lived when, after having accomplished noble deeds, one goes to Hades without a song of triumph. A statue of the victor could also be erected in the sacred precincts of Olympia. There,
 71950 often caught in one of the impressions, he would the most exciting moments of combat, to be held up as an example for posterity to imitate.
 Thus Olympia, albeit in a very peculiar way, became Dorian. Here too, the old Achaean period was definitively over; the Dorian-Hellenic era began. The Dorian Heracles appears in the legend alongside the Achaean Pelops and even occupies a much broader
 71955 position. It was Heracles who, in the distant past, established the divine peace and devised the various forms of combat; he had also journeyed to the distant land of the Hyperboreans to fetch the wild olive tree, with whose foliage the heads of victors would henceforth be wreathed. After Heracles, however, this entire institution fell into disuse, until finally Iphitos began to reintroduce it. Later, the Eleans
 71960 repeatedly recalled some kind of contest instituted by Heracles at that time, and naturally, it was immediately reinstated. The courage to introduce the new was found here, as so often, only in the conviction that it was actually the genuine old one. But although almost everything characteristic of Olympia was derived from Heracles, even less so than Oenomaos before, Pelops could now be completely set aside; had he
 71965 not, precisely through his struggle with him, first wrested the sanctuary from utterly barbaric hands? Centuries later, two sanctuaries to Heros were displayed in Olympia's sacred field, one in memory of Pelops, the other in memory of Hippodameia. The later generations that flocked to the famous altar of Zeus at Olympia also walked once more in deep reverence around the sanctuary of Pelops, located just behind it.
 71970 The Elean movement was undoubtedly awakened by the Spartans. The later mythology therefore aptly portrays Lycurgos and Iphitos as allies. On the disk on which Iphitos had the terms of the peace engraved, it was thought that Lycurgos' name could still be recognized later, when the letters had already been more or less erased. It is certainly not entirely impossible that they were contemporaries, but that aside, it
 71975 can hardly be doubted whether the Eleans could count on Sparta's support in their great endeavor. Difficult times had dawned for both countries. Now it is the mighty Pheidon, who, at the head of the Ionian national component in the Peloponnesus, rises up in Argos, seizes sole power, and pushes back all that is Dorian, even marching right through the peninsula to the legitimate city of Elis, where he temporarily
 71980 grants the Pisans possession of their sanctuary. Then again, it is the vanquished Messenians who rise up; all Achaean or Pelasgian sentiments unite, and the Dorian order of things, barely established, threatens to be destroyed forever. Sparta and Elis stood alone in the unequal struggle; but the enthusiasm for the great cause ultimately made them triumph. Messenia was crushed; Pisa, though long spared, was

71985 ultimately so destroyed that a few centuries later one could seriously question
whether there had ever been a Pisa at all. The new could not establish itself here
except on the ruins of the old. But these were by no means the greatest victories
achieved. Far beyond the reach of Spartan weapons, kindred peoples were gripped by
the spirit emanating from Sparta and Elis and inspired to a higher life. Already
71990 during the Second Messenian War, it was the Athenian Tyrtaeus who led the Dorian
warriors to battle with Ionic songs, and the famous poet Alcman, a Lydian by birth,
found his spiritual homeland in Sparta. And as for Olympia's spiritual victories, it
was nothing unusual that in the Nemean Games, when they were reorganized under Dorian
influence at the beginning of the sixth century, a wreath of foliage also became the
71995 victor's reward. The triumph of Elean ideas was more clearly illustrated by the fact
that when, not long before the reorganization of the Nemean Games, Ionian influence
made itself felt in ancient Delphi, the Pythian Games there received a new regulation
modeled on Olympia: initially, contests were still held for prizes of any value, but
later, the reward of an olive wreath was introduced. It was the Ionians who brought
72000 the remaining ancient Doric sanctuary into the Dorian movement. However, the
organization of the Corinthian Games on the Isthmus was clearly an act of hostility
against Olympia. Not only is the Ionian demigod Theseus the patron saint here, but of
all the Greek tribes, the Eleans alone are excluded from participating in the
competition. Yet, even here, the spirit of the times was too strong.

72005 People fought over a wreath of foliage. Olympia was already a common Hellenic
sanctuary in the 7th century. Not only festival-goers from the Peloponnese flocked
there, but also from Thebes, Athens, and even from the most distant colonies.
The Spartan and Elean movements went hand in hand; yet both retained a certain
72010 uniqueness. While Sparta, when it called Terpander and Thaletas to its fold, had
clearly shown that it wanted to strengthen itself through what related peoples
elsewhere were bringing to the fore, the Eleans found their true calling in every
endeavor among the Greek tribes that allowed an ideal conception along the Dorian-
Elean lines to be incorporated, as it were, into general Hellenic life, by giving it
72015 the opportunity to express itself at Olympia. It was largely due to the influence of
Elis that the Dorian current broadened into a more general Hellenic one. Even in the
face of their Achaean past, the Eleans maintained a more lenient mindset and a
sincere desire to always recognize the good wherever it appeared. The brilliant
lifestyle of the ancient Achaean rulers continued to permeate, especially in Ionian-
72020 Aeolian lands. While this contrasted sharply with the austere austerity of the
Spartans, immense wealth and distinguished generosity inevitably made a deep
impression on the Hellenic mind, so open to all human splendor. The Eleans did not
reject this expression of the Hellenic spirit. They came to understand that "wealth
adorned by the pursuit of excellence" is one of man's most glorious possessions: when
72025 the nobleman showers the splendor of his status on his fatherland and friends, when
he adorns the altars of the gods with precious offerings for the glory of his city,
when he delights in receiving friends into his home, [2] when magnificent stud farms
are built at astonishing expense, and swift charioteers drive the beautiful horses
around the racecourse—a magnificent and impressive spectacle for everyone to enjoy.
72030 Thus, wealth is conceived from an ideal perspective, and the sacred field also offers
the opportunity to display its full splendor to the assembled Hellas. Already a
century after the rule of Iphitus, horse and chariot races were introduced at
Olympia. The Eleans were concerned with maintaining a neutral stance as much as
possible. They sought, above all, to unite, not to alienate. When, in the 6th and 7th
72035 centuries, numerous illegitimate rulers emerged in Ionian Greece, who, insofar as
they lived in the Peloponnese, where Dorians had settled among the Ionian
population, pushed Dorian influence into the background—we have already mentioned
Pheidon—the Spartans became the mortal enemies of this more Asiatic than Hellenic
manifestation. Without a doubt, they rendered great service to the further
72040 development of their people; yet the attitude of the Eleans in this matter also
demands appreciation. True to their principle of being as generous as possible, they
did not close the Olympian racecourse to the tyrants, not asking what anyone else
was, provided they only performed worthily as a Hellene at Olympia. More powerful and
grandiose was the Spartan action, but the Eleans' action had the great advantage of
72045 preserving all the sparks of Hellenic life and better enfolding the various members
of the Hellenic people in a common bond.
Yet the Hellenic tribe had not yet borne its noblest fruits. The Athenian had not yet
driven out his tyrants, had not yet felt that higher inspiration that the struggle
for freedom against the Persians would cause to surge through his breast. The Ionian
72050 life on the coasts and islands had much that was brilliant and noble, but its finest

revelation in the Athens of Pericles was still to come. It did come, and the multifaceted work and endeavors of the Ionian were ennobled by a fervor for the ideal that one might call Dorian, had it not originated here as well, and had it not extended infinitely further than in Sparta. In Athens, too, there was a republican desire for freedom, yet the Spartan was content if the government allowed him to live as a free Dorian. The Athenian could not imagine freedom without co-government, nor republican institutions without democracy. In Athens, too, there was a striving for masculine virtue, but here, where life was so much more multifaceted, it was also linked to the pursuit of the realization of so many other ideals of human glory. People worked in every field to elevate themselves and glorify their fatherland. The Dorians' contributions to the development of Greek art are great—one thinks, for example, only of the Doric architectural order—but with Aeschylus, Sophocles, Phidias, only a very few can be mentioned in the same breath. This Hellenic light, too, was intended to shed light on the universal national sanctuary. Phidias, accompanied by a whole staff of artists, was summoned by the Eleans to Olympia to complete major works on the Temple of Zeus. Alkamenes, for example, depicted the battle of the Lapiths and Centaurs on the west façade; Paionios, on the east façade, the combat of Pelops and Oenomaos. The great master himself sculpted the statue of Olympian Zeus here, which was erected in the interior of the temple; the most famous work of Phidias's chisel stood in the sacred field at Olympia. Thus, the Eleans acquired a unique place at the center of Hellenic life, but one must beware of equating the Greek tribes' need for communal life and striving too closely with, for example, the German or Italian unification movement of our time. They felt united against the barbarian world, yet simultaneously delighted in the differences of character and gifts they observed in each other, seeing in this a guarantee of versatility. Several distinct dialects and national art forms of individual tribes became universally Hellenic. They were used to express the various feelings and moods that, while most powerfully developed in one Hellenic tribe and another in another, had also first found their appropriate form of expression, yet which, through the inner spiritual affinity of the various tribes, could nevertheless also arise in every Hellenic soul; the choruses of Attic tragedy, for example, usually spoke in a more or less Doric accent; Doric sounded more solemn than Attic. Such a sense of community precluded rather than demanded political unity. How else could it come about than through the rule of one tribe over another, which naturally also had to be accompanied by the suppression of the national idiosyncrasies of the subjugated tribe? It was precisely through the larger states' striving for hegemony, the striving for political unification, that the true sense of a higher Hellenic community among the Greek peoples was forever destroyed. What originally brought the Hellenic tribes together was the purely human need of man for man: people understood each other, considered the same things "beautiful and good," found in each other recognition and appreciation for their deepest inner feelings. Thus, Olympia, which could never later become a Derby or Longchamps, became a center around which the life of a richly gifted people moved in its full significance. We have here before us one of the most remarkable phenomena of historical ethnology. Often, when a higher sense of human calling reveals itself in a people, it carries within itself, as it were, the infinite, strives for the more than human, and extends the meaning of human existence far beyond the grave. We find a similar spiritual direction in antiquity, to a greater or lesser extent, among the various Eastern peoples, and later, developed in all its sublimity, in Catholic Europe during the Middle Ages. The Hellenic world, insofar as it was not yet under the influence of philosophy, offers very little that is akin to it. The Hellene, after all, went no further than the glorification of his earthly existence. Everything noble that manifests itself in the person who lives wholeheartedly for the present was noted and brought to higher perfection; there was no attempt to elevate oneself to a realm of more than human beings; spiritualization of matter is the highest thing known. For very few Greeks, the Deity is the ineffable, entirely exalted above the sphere of all that is human. The Gods, indeed, excel in their full glory far above the human world, yet they are nevertheless united with it. Far from being the glorious consummation for the Greek of what had begun here on earth, it was at most, quite the opposite, the fading twilight of an already extinguished torch. One reached the highest here on earth, and having achieved it, one could lay one's head down in resignation: it was natural, after all, that one should perish, now that one no longer had any reason to exist. When Diagoras, himself victorious at Olympia, saw both his sons triumph in one day, a Lacedaemonian cried out to him: "Die, Diagoras, for you will not ascend to heaven!" It was also the Greek's sense of moderation that compelled him to reach out for nothing higher than the earthly. If one were to feel a more far-reaching

inclination welling up in the soul, the stern warning would soon sound: to try to set foot beyond "the Pillars of Heracles." There is much in the striving of the Greeks that resonates in our souls; yet we constantly feel that a wide gulf of many centuries lies between us and that world.

What Rome is for the Catholic, what Mecca is for the Muslim, that was—if any comparison is still possible among such disparate people—for the Greek Olympia. It was, as it were, an entire Hellenic world in miniature; every Greek tribe had given proof of its existence there through buildings, statues, or other votive offerings. The aforementioned Pausanias devotes approximately two-fifths of his description of Greece to Olympia. In later centuries, however, nothing of the former grandeur could be observed on the beautiful plain south of Kronos Hill. All the buildings had collapsed, the statues broken, and the Alpheios, no longer restrained by waterworks as before, had, through its numerous floods, covered the entire ancient site with a layer of sand and silt several feet thick. Little remained of the ruins; only here and there a single broken column protruded a foot or so above the silted ground. This remained the situation for hundreds of years; no one thought of the abandoned sanctuary. Only when, in the previous century, people began to clearly understand that one could learn to understand the Greek from his works of art, no less than from his literature, did a different era begin to dawn. It was Winckelman, the great spokesman for that movement, who first proposed the plan to excavate the silted ground here. A rich harvest was expected here; after all, the silt from the Alpheios was supposed to have saved many works of art from further destruction. The brilliant German, however, did not live to see his plan realized. Since then, Olympia has been receiving more public attention. It was also visited a few times by Englishmen, and one of these visits was so successful that the exact location where the remains of the Temple of Zeus were buried could be pinpointed. More was accomplished when the French undertook their expedition to Morea in 1828 and 1829; the commission of scholars that followed this expedition, among other things, excavated the ground on the north and south sides of the Temple of Zeus; very important fragments of the temple's metope reliefs were discovered. Nevertheless, Winckelman the German's plan was only implemented in its full scope and true significance by Germans. At the expense of the Imperial Government, under the supervision of the renowned Berlin Professor Ernest Curtius, a complete scientific expedition of German scholars was organized. They planned to excavate as much of the silted soil as possible, in order to salvage what could only be salvaged of the buried treasures. Work on this has been ongoing since 1876. Excavating in all directions from the Temple of Zeus, they have uncovered the ancient soil of virtually the entire Sacred Field and a large portion of the surrounding area. The results met the highest expectations. The remains of virtually all the buildings at Olympia mentioned by Pausanias have been recovered; so numerous, in most cases, that one can form a very good idea of their layout, order of construction, and even minor architectural details. Eighty-seven statues were found, including 44 larger than life-size and 42 heads. Among them, one finds outstanding representatives from almost every period of Greek art. So many remains have been found of façade groups by Alcámenes and Paionius, and of the metope reliefs, that one can form a fairly clear idea of their composition, and even their complete or partial reconstruction is possible. The Nike of Paionius is the first freestanding statue by a master from the school of Phidias that we possess; the Hermes of Praxiteles is the only original work from which we can learn about a later art movement. The host of smaller finds, especially of terracotta, the 5,000 coins, and the nearly 400 inscriptions, including some very important ones, could in themselves constitute a not inconsiderable museum. When the undertaking began, Professor Curtius expressed the opinion that it would lead to good results if, just as in the natural sciences, in history and archaeology too, one sought to expand the number of known facts primarily by systematically searching in places where one could be sure of finding something. That hope, as we have seen, has not been disappointed. The entire undertaking is a great credit to the German government and German scholars. We can count ourselves fortunate that it has not been fruitless for our country either. In an annex building

At the Leiden Museum, casts of some of the most important sculptures found at Olympia, purchased by our government, are being installed. Pausanias's detailed description now takes on greater value for us. With it in hand, we can, as it were, stroll around the sacred field and take stock of the various buildings we pass, and admire many of the famous sculptures he also saw there. Readers are invited to take such a walk in the second part of this essay. Leiden.

Olympia.
(Continued from, Vol. I, p. 86.)

II.

72190

Most Greeks who wanted to visit Olympia certainly first went to Elis, the capital of the region of the same name. From there, two roads led to the sacred plain further south. The main highway, the so-called "sacred road," ran closer to the sea across the flatter coastal land and was about ten hours' walk long; the other, to the east of this one, was somewhat longer, winding between mountains and hills, thus offering

72195

the hiker more variety. Both roads, however, ended at the sacred site on the west side. No sooner had one entered the plain, enclosed on all sides by hills, as we recall, than one suddenly saw several buildings and, above them, the battlements of more distant temples. Between the buildings, one could already spot a few higher-placed statues here and there.

72200

Crossing the bridge over the Kladeos, one found oneself surrounded by numerous buildings. On its left, that is, on the north side, was the so-called Palaestra, a residence and training ground for the warriors during the festival season. However, this could not be entered from the south side; To reach this, one had to walk around to the north, where a stately forecourt (propylaion) provided access at the northeast corner of the building. As was customary in training schools for fighters, here too, an open square area was found inside, where the wrestlers could practice whenever

72205

they wished; for, like a true virtuoso, a Greek fighter never abandoned his exercises for a single moment; even during his five-day stay at Olympia, he had to ensure he maintained the level he had reached by constantly keeping his limbs supple. While

72210

some wrestled, others could walk around the square wrestling arena through a colonnade that ran around it on all sides, sometimes talking to each other, sometimes keeping an eye on the wrestlers. On the south side, the colonnade was double; the open side, where the columns stood, faced inward, as one understands. If one had had enough of walking, one could break through one of the doors on the back wall of the colonnade. One then entered either a bathroom, where one could bathe, or a common room where one could speak or listen to a lecture—remains of the beautifully profiled benches along the walls still remain—or a bedroom. On the north side, one had not only an entrance to the forecourt through which one had entered, but also others leading to an outdoor area on the north side, where several small racecourses and areas for jumping and discus throwing were located. A long, two-aisled gallery ran alongside this on the east side, heading north.

72215

Returning to the bridge over the Kladeos, one found on the right a fairly large, oblong, square building with its front facing east. It is suspected that this was the building in which Pheidias finished his greatest masterpiece, Zeus of Olympia, down

72225

to the smallest detail. Entering the large front door, one entered a very spacious room, the only one in the building, which likely received its light from the top center. At the front was a marble basin. Parallel to the side walls, not far from them, stood four columns at equal distances on either side, starting from the back wall. These, too, were replaced by a column on either side by a tall, narrow wall,

72230

which connected to the side wall and thus filled the space left open elsewhere between the columns and the wall. Two more columns followed on either side, reaching the front wall. The building's dimensions—this is one of the reasons why it is considered Pheidias's workshop—were exactly the same as those of the interior of the Temple of Zeus. Just as there, seven columns on either side, running close to the side walls, divided the entire space into two narrow aisles and a wide central nave, so too were the six columns on either side and the narrow walls. Furthermore, the various sides of the workshop faced the same points of the sky as those of the temples turned, so that the same light would have fallen down here through the opening in the roof at all times of the day. These small walls, instead of columns,

72235

would have served to attach a partition when the master wanted to seclude himself with his artwork in a smaller space, for it could also happen that, while working on it, he needed to see his artwork in a different light than the one in which it would later be erected. Even in modern studios, one finds devices to cast a different light on the objects by firing off a portion of the interior space. Naturally, the artist

72240

had to have all sorts of tools at his disposal, which were indispensable for creating such a colossal sculpture. Traces still remain that prove that planks were attached to the walls of the building, supported by iron bars that protruded as if from the ground. These would have served to store such tools. Turning from here to the south,

72245

one saw before them a beautiful and large building, the Gymnasium, which, like the northern Palaestra, served as a residence and training ground for champions. There were no race tracks at this Gymnasium; however, the building itself was more beautiful and larger than the northern one. A beautiful gallery, open to the outside, with Ionic columns, supported by a beautifully ornamented architrave (a crosspiece spanning the columns) and a beautiful geison (cornice), ran around it. Before entering the building, one could walk around it under this gallery, a walk of over three hundred meters. Entering, one entered the building's various rooms, which ran in two rows side by side around the large square courtyard. The ceilings of these rooms rested on Corinthian columns, whose calyx-shaped capitals were now smoother than usual. Undoubtedly, this form of capital was borrowed by the Greeks from the Egyptians. The Corinthian capital usually depicts an open calyx with numerous petals and delicate stems rising from it. However, since the open calyxes of the Corinthian capitals from the Gymnasium are not as elaborately detailed as capitals of this type usually are, they are more reminiscent of the smoother papyrus or lotus calyxes of Egyptian columns and reveal the origins of the art form all the more clearly. If one now went straight through these two rows of rooms, one entered a gallery supported by Doric columns, which ran around the square courtyard, its open side facing it. This Gymnasium was a building from the fourth century BC.

Let us place ourselves for a moment between the Gymnasium and the wall of the sacred precinct, the Altis. Our view of that area is only obstructed to the extent that one building obscures another. Here we see the rear of the Temple of Zeus with the group of Alcmenes on the facade; we see several other buildings more closely, such as the sanctuaries of Pelops and his wife; we see numerous sculptures—gods, humans, horses, chariots—and several altars. The altis wall didn't even reach as high as the stepped pedestal of the Temple of Zeus and therefore offered little obstruction to the view. It also seemed to exist more to demarcate the sacred area than to prevent access. Along its outer edge, one could see a whole row of troughs for horses and cattle. This western altis wall allowed entry to the sacred area at two points. There was an entrance opposite both the Palaestra and the Gymnasium. However, these were not the main ones. This was situated further to the southeastern corner of the Altis. If one went there and turned the southwestern corner, one suddenly saw the rear of a prominent building, the so-called Leonidaion, named after its founder, the Elean Leonidas.

This building consisted of three parts. Two elongated buildings, both rounded at the rear, were connected by a relatively small, square central building, while a gallery ran in front of all three. As the excavated remains still clearly demonstrate, it had the following history. First, at the end of the sixth century BC, the southern building was constructed. Its base had the shape of a very elongated ellipse, however, only rounded at the rear, while the front was cut off straight. At this front, the two side walls curved slightly into so-called "anten." Between those two ants stood two columns, and the space between the ants and the columns was filled with metal latticework. There were two doors in the latticework between the columns. Under the cornice ran around the the entire building was bordered by so-called triglyphs and metopes (well-known architectural forms, which we will discuss later). These were painted blue, while the frames that typically ran above and below such triglyphs were painted red. Several buildings at Olympia provide evidence that the Greeks used strongly contrasting colors to set off the different parts of an architectural composition. A row of columns ran through the center of the building along its length, and it is not too daring to assume that a roof, probably wooden, sloped upwards on all sides, rested on this. In the rear curve of the building, two rooms were found that could be closed off.

In a few minor details, particularly regarding ornamentation, the northern building differed from the southern one, and moreover, in that the ellipse of the ground plan had merged into a figure consisting of two straight lines, connected on one side by a straight line, and on the other by a semicircle. This building was erected a few years after the first, at the beginning of the fifth century. Later, the two buildings were connected by the smaller building in between, and the gallery for all three was probably built at the same time.

What was the purpose of the Leonidaion? We know nothing about it with certainty. It seems not unlikely, in my opinion, that it was a building to house the theors, the official representatives of the various states for the great festival every four years. Originally, the southern building was donated by the Elean Leonidas to the sanctuary of his state. Now, here as elsewhere, the theors were housed in tents, and the architect of the Leonidaion intended to give the stone building somewhat the appearance of the temporary building, the tent, it replaced: the somewhat oval-round

72315 shape and the sloping roof on all sides naturally bring a kind of tent to mind. When they later wanted to construct a second building, identical to the first one to the north, they no longer knew the underlying motive for the first one, and they thought they were merely removing a minor irregularity by replacing the gently curved side walls of the new building with perfectly straight ones. This, too, is an example of

72320 how dangerous it is to imitate ancient art forms. That the name Leonidaion, originally borne by only one building, was later extended to all three of these buildings when it was connected to the northern one by an intermediate building, is quite understandable. If this building was indeed originally such a lodging for theorists, then we can easily understand why, as Pausanias tells us, the Roman

72325 officials who governed the province of Greece would later stop at this building on their procession through their region. This was still the case here on the south side of the Altis at the time Pausanias visited Olympia (circa 120 AD). Somewhat later, a large gallery was built parallel to the southern Altis wall. It opened to the south and, starting at the south side of

72330 the Leonidaion, extended for a length of some 80 meters. It was very wide, and a second row of columns, running midway between the front row and the closed rear wall, divided it into two aisles. However, before it was erected, this was already a very suitable vantage point from which to survey the Altis grounds. The low wall seemed to separate it, and several buildings were visible here for the first time, or to a

72335 greater extent than before, only partially obscured by a cluster of statues erected here around the Temple of Zeus and opposite it in the southeastern part of the Altis and along the southern wall. Among statues and altars, one could still see the Altis area, but just behind the Leonidaion, "the olive tree of beautiful wreaths," whose branches were cut for the victors' wreaths.

72340 But we didn't linger much longer outside the Altis wall and went through the large southeastern entrance, through which the solemn procession to the Zeus altar took place on the last day of the great festivities, and which was therefore called the "entrance of the processions." Without much difficulty, we now found ourselves right in front of the front of the Temple of Zeus, which stood here in the middle of a

72345 large terrace. Pushing forward between the statues that lined the edge of this terrace, one saw the building, now unobstructed by anything, before one in all its quiet majesty. The building with its Doris rose from the almost two-metre-high pedestal, which narrowed upwards on all four sides with three steps.

72350 The columns rose powerfully and stately. It is known that columns of this type had no base, but rose from the ground itself as if by natural force. The shaft of the columns had, as usual, twenty ascending grooves (flutes), gradually narrowing somewhat upward. The capital, also something very common, consisted of a broadening of the column upwards, convexly expanding on all sides and left completely smooth,

72355 separated from the actual shaft by four annular grooves and covered at the top by a square plate. A cluster of similar annular grooves ran around the shaft a short distance below the capital. The columns on the front and back (six for each front) were slightly thicker than those on either side; They therefore had to support the large, vertically oriented triangular gables, while only the lower edges of the

72360 sloping roof rested above those of the sides (each side had eleven). Immediately across the columns, however, ran the architrave, a smooth block separated at the top by a slightly projecting, narrow frame from the band of triglyphs and metopes that, in turn, ran above it. The triglyphs were elongated squares with grooves upwards, two in the middle, two as if cut in half at the edges (the word means "provided with

72365 three grooves"). They were pushed forward somewhat, so that below the edge of the architrave, they seemed to need to be supported by a narrow frame with small, spaced-apart blocks, called drops, underneath. With the triglyphs, the transverse structure above the columns already extends slightly forward to accommodate the leaning cornice. The metopes were left plain, and squares remained near the triglyphs,

72370 separating them from each other; these, as the name also indicates, represented the former window openings. These triglyphs and metopes now continued further up in a flat band; soon, however, followed the cornice, the geison, which, as we mentioned, overhung slightly and for which a frame with drips was again attached to the band above each triglyph and metope. The geison was a not very wide, vertically oriented

72375 platform bordered by a cornice. Such a geison also ran along the upright sides of the obtuse-angled triangular gable. Above the geisons on both long sides, leaf-shaped decorations (Simen) were placed here and there, below which a lion's head was placed, from whose open mouth the rainwater flowing from the roof flowed down. The walls of the interior temple house could be seen through the columns. For the columns of a

72380 Doric peripteral temple like this one were always spaced some distance from the walls

on all four sides, so that the roof of the entire temple was actually the roof of that internal building, which extended at the sides to the columns, and at the front and back to the facades resting on them.

The building was not particularly high; it is well known how much all things excessive offended the Greek artist. From the terrace floor to the highest point, it measured no more than 20 meters, a height equal to that of many a mansion on the Keizersgracht canal in Amsterdam. Its length was 64 meters, its width 27 meters. Up to the architrave, the building was constructed of Elia shell lime, coated with a layer of fine white that made the temple shine even from afar. The entire superstructure was made of Pentelic marble. The vertical surface of the geison was painted bright red, so that a red border ran around the entire building at the lower end of the sloping roof and around the three sides of the gable triangles; the narrow moldings, which served to support the geison from below, were dark blue; the simen and lion heads also bore colors. Shields were attached to the metopes of the front and the south side, a votive offering from the Roman consul Mummius, the conqueror of Hellas and organizer of that country into a Roman province. Mummius sought to bring himself and his family into closer contact with the Hellenic world by endowing the principal Hellenic sanctuary with numerous votive offerings. The descendants of someone who had first conquered a province often considered themselves connected to that province by some bond and usually represented its interests in Rome, for example, in legal matters. Traces of the edges of Mummius' shields are still visible on several of the recovered metope blocks. At the top of the facade, radiant with the gold with which it was covered, stood the image of the goddess of victory, Nike, the heavenly one, for whose soul-stirring gift nowhere more than here was her head raised in supplication. On both the corners, also covered in gold, were adorned with decorations in the form of Greek cooking vessels: deep basins between three upright bars, allowing them to be placed over the fire. Vases are still sometimes used in the same way as ornaments on buildings today. These decorations, as well as the Nike, were the work of Paionios, one of the masters with whom Pheidias had journeyed to Olympia. The Eleians had held a competition for them; Paionios' designs were victorious. At the foot of the Nike was attached a golden shield of the goddess Athena, on which, as is well known, stood a Medusa's head. It was a votive offering from the Spartans and their allies after the victory over the Athenians at Tanagra. It will come as no surprise that none of these objects, so richly adorned with gold, have been recovered. But what was most striking about this facade was nothing more than the group of larger-than-life statues placed within the triangle of that facade. It was the work of the same Paionios who created the facade decorations, and depicted the contest between Pelops and Oenomaos, which, as we recall, would decide for Pelops whether he would acquire Hippodamia and her father's kingdom, and for the sanctuary and the entire landscape; whether Pelops or Oenomaos would henceforth rule; whether the realm of barbarism would be supplanted by one of gentler morals, yes or no. Nearly all the figures of this group have been recovered, though they are badly damaged. Yet, the way in which they are to be assembled into a whole, at least in the main, remains rather uncertain. The statues are made of marble. Bright colors, applied here and there, made some parts stand out more sharply from others, as in architectural compositions. The artist has chosen the moment that will bring the decision. Zeus, the supreme judge, has emerged in the center of the facade. He has positioned himself directly facing the viewer. His head and arms are still missing. His chlamys, a cloth draped around the shoulders as a cloak—gods and heroes often wear nothing else in sculptures—had fallen completely to his hips. To his right hand, facing the viewer on the left, stands Pelops, a slender, beardless youth, completely naked, and presumably holding a spear in his left hand; both arms, however, are missing. Beside him stands his bride Hippodamia, her right arm pressed against his body under her gently curved bosom, her left raised across her chest to her chin. Her head is tilted slightly to the left, that is, towards the chief judge. She wears a chiton, an undergarment that reaches from the shoulders to the ground, and over it a peplos, an outer garment that reaches no further than the hips. To the god's left hand, facing the viewer's right, stands Oinomaos with a broad, bearded face, a helmet on his head, his right hand at his side, the left presumably on his spear; both arms are missing. He has folded his chlamys and thrown it over his left shoulder. Of his wife Sterope beside him, we have neither the head nor the arms. She seems to have turned her left hand slightly away from her, holding her right close to her side. Her undergarment, a chiton, is held up by a girdle around the middle, which is, however, obscured by the overhanging folds. It falls fairly vertically; she is therefore standing almost completely upright; she has only placed her left leg slightly forward. Over her chiton hung her hip-length outer garment, peplos. Beside her,

mostly turned toward his horses and thus turning his back to her, lay Oenomaos's faithless charioteer, Myrtilos, on his right knee, while his left leg, closest to the wall, was still raised at a sharp angle. Of the arms, only the left hand, which
72450 gripped the reins, has been found; he seems to have held it up toward the horses. At the same time, he presumably looked at Zeus with his head, as much as possible, over his right shoulder. This, however, has been lost. His robe hung over his left shoulder and further over his hips and legs. At Hippodamia's side, naked as his master, Pelops's charioteer, Killas, sat on his right leg. He is turned forward
72455 toward the viewer, though not entirely, as he is somewhat more turned toward Zeus than toward his horses. The head is missing. The left leg is raised. His posture is therefore quite similar to that of Myrtilus. The placement, however, is slightly different. Directly behind the horses of Oenomaus, four in number according to Pausanias, sat, facing Zeus and thus with his left side towards the viewer, a
72460 venerable old man, deeply sunken on his overturned left horse leg, most likely resting on the downward-extended left arm, which then rested with its hand on the ground. The other arm was placed with its elbow on the still-raised right leg; the head rested with its right cheek in the open hand. Pensive and in silent attentiveness, the old man looked at the chief umpire. He was probably a priest or
72465 diviner, at least a man who understood the significance of the moment better than anyone else. His robe was wrapped only around his legs and hips. The arms are missing, but it is still clearly visible on the right cheek that it rested against the hand. A similar figure sat behind Pelops's four horses. He knelt, facing away from Zeus, on the left leg, the one most turned towards the viewer. By bringing his
72470 left arm back a considerable distance, however, he could, resting on it, turn his chest and face towards the umpire; his right hand rested on his still-raised right knee. This figure is badly damaged; here too, the arms are missing. In the two corners of the façade, on either side, one saw two gods of the landscape, for which the matter was naturally also important: Pelops the Alpheus and a nymph, probably the
72475 god of the Pisa spring, which flowed into the Alpheus in the area of Olympia; and Oinimaos the Kladeus with a young river god, not unlikely the god of the tributary (the name is unknown as far as I know), which fell into the Kladeus north of the hills of Olympia. The two main streams lay most prominently in the corner of the façade, their entire lengths on the ground: their faces were turned towards Zeus; the
72480 Alpheus probably leaned on his left arm, while the right, turned backward, rested on his thigh. The Kladeus lay prone on both arms. In both cases, the garment covered only the hips and legs. The head of Alpheios and the arms of both are missing. The nymph sits opposite Alpheios on her left leg. Yet, she turns her head slightly toward Zeus. Her right hand was probably on her right knee; both arms, however, are missing.
72485 She was dressed in a chiton and peplos with a girdle over both. The youth at Kladeos is more drawn away from his river god than she is by interest in what will happen. He, too, sits opposite him, in a very relaxed position: his right leg is tucked under him, so that the foot reaches behind his upright left; his left hand rests against the turned-away side of that leg; the robe hangs only over his left shoulder; he sits
72490 on part of it. However, wanting to know what was happening, he has, supporting himself with his right hand on the ground, turned his entire upper body slightly away from Kladeos, so much so that his legs have more or less followed that movement. His head is still missing. Incidentally, it is one of the best-preserved figures. This is the case with the group on the east facade. The composition is easy to grasp:
72495 the bond connecting all these figures is the greater or lesser attention with which they all direct themselves toward Zeus in the center of the facade; the pendants differ from one another, yet are easily recognized as such. At first glance, one sensed the solemnity of the moment. After the group on the east facade, it was
72500 obvious to take a closer look at the one on the west facade, which one had already seen in passing along the west wall of the Altis. It was the work of Alkamenes, the man who, according to Pausanias, won second prize with Phidias in a competition. Perhaps this can be connected to a tradition concerning both artists, which, although
72505 written by a very late author, undoubtedly stems from an older source and has considerable plausibility. Both artists had created a statue of the goddess Athena, which was to be placed atop a column. Initially, Alkamenes' work far outperformed that of Pheidias. However, no sooner were the two Athenas placed on a column than that opinion changed completely. It is not unlikely that this story contains a memory of that contest, from which Alkamenes emerged as the inferior, yet nevertheless a
72510 worthy rival to the incomparable master. We see him here at Olympia in his entourage, recognizing his superiority and accepting the work that, in the master's opinion, best suited his particular gifts. It was the battle between Lapiths and Centaurs at the wedding of Peirithous that he was commissioned to carve: the sculpture of the

rear facade, the western one. This battle was a very favorite theme for the Attic artists of that time. Similar representations are found on the frieze of the temple of Theseus on the metopes of the Parthenon and on the frieze of the temple of Apollo at Phigaleia, the latter Attic masters also worked. The ancient legend had acquired a new meaning for these artists: the battle of the Lapiths and Centaurs was a struggle between civilization and barbarism, meaningfully and truly Hellenically presented as one of ennobled humanity and self-control versus animal lust and licentiousness.

The same is true here at Olympia. The story of that battle is well known. At his wedding to Deidamia, a hero from the Lapiths, Theseus's usual companion, Peirithous, also invites the wild Centaurs from the mountains, creatures who were horselike beneath and therefore had four legs, but human above and were therefore also endowed with two arms. At first, everything goes quite well, but finally, intoxicated by wine, the Centaurs lose their unusual self-control. The wild Eurytion suddenly rises and seizes the bride. Now all bond is broken. That example proves decisive for the other Centaurs. One steals a virgin or woman, the other another. The Lapiths, however, were not the men to allow such a thing. With tremendous courage, they rush upon the robbers. It is one long assault, one long fight, one wrestling, one wrenching! Finally, the battle is decided: the Lapiths are victorious.

The artist now has that decision brought about by the appearance of Apollo, the patron saint of higher human conditions and an ennobled way of life. It is he who emerges from the middle of the facade amidst the wild spirit of battle. He extends his right arm imperiously to the right, his head also slightly turned in that direction. He is a slender, powerful young man on the verge of manhood, completely beardless. He wears his chlamys over his left forearm and further behind his back, with a long tip draped over his right shoulder. He thus appears almost completely naked. With his left hand, he probably rested on his bow. The figure has now been found in fragments, complete except for the left foot and the right lower leg. Traces of red paint have been found on the chlamys, which further confirms the belief that the ancients often painted their sculptures. We could therefore safely assume that the group on the facade wore some colors. On the right side of the god, towards which he turns his head, in front of the viewer on the left, probably stood Eurytion and Diedamia, the bride. Her chiton, here with sleeves, is of very fine linen and covered the entire body and upper arms, hanging in thin folds. It was held up by a girdle around the middle; she also wears a peplos. The fine chiton identifies her as a bride. The unfortunate woman is grasped between the right foreleg and the left arm of her captor. In mortal fear, she defends herself with both arms. Turning slightly toward him, she gazes up at the broad, coarse, sensuality of her captor, her virginal right hand pressing with all her might against his temples, her left gripping his broad, rough, ring-beard. It is a terrifying moment. Fortunately, however, her savior is near, and without giving the Greek artist too much credit for modern romanticism, we may well assume it was the bridegroom himself, Peirithoos. He is already in a forward stance, taking long strides, with his left leg, placed forward and naturally slightly bent, the one furthest from the viewer, pushing the monster aside. The chlamys has slid from his shoulders under that violent movement; a tip still hangs over his left leg, but on the right, stretched right back, she has sunk completely at his heels. The bride's head is still missing; Of the groom, everything except his right foot and left leg, with a piece of the abdomen, both with parts of the dress. Now, there is still a head available, which was previously assigned to one of the girls in the group, but since a piece of that girl's actual head was found, it must be given to another. Apparently, there is no figure in the group to which it could have belonged, except the groom, and it has been noted, among other things, in Pelops and Apollo, that the Greek could very well imagine youthful strength as beardless, and the beardless Lapith forms a very apt contrast to the shaggy Centaur. Yet, to give the brave groom a head originally intended for a girl, simply because all the girls and the other figures on the facade, one for one reason, another for another, seem to disdain it, is rather bold. It is best to wait and see if a piece of torso or neck is found that could clarify the matter.

To the left of the god, in front of the viewer on the right, one saw a Lapith virgin of noble features and body, dressed in a chiton and peplos and a folded cloth wrapped around her head, secured with a small knot above her forehead. The centaur has grasped her with both arms around the middle and presses his left hand against the virgin's bosom. She turns to the right and tries to wrest herself free from his with both hands. The arms of both figures are missing. Only fragments of the four hands remain. Nothing has been found of her rescuer except the right foot and the right arm, with which he appears to have wielded an axe; at least in the centaur's head, an open axe wound is believed to be visible. Who he was seems not difficult to guess.

Peirithoos on the other side could hardly have been flanked by anyone other than his
72580 friend and companion Theseus; and with this, Pausanias's statement in his description
of the group, that Theseus fought with an axe, is entirely consistent. Right next to
Peirithoos, a fearsome struggle is taking place. A centaur, the front of whose body
72585 emerges directly from the wall—the rest, as it were, remained inside—is being seized
on the left side (the spectator's right) by a Lapith, who had thrown his right arm
around his neck and was now trying to drag him to the ground. The brave youth is seen
more from the side than his opponent, but not entirely. He rests on his left knee,
while his left foot, due to its slightly slanted position, disappears into the wall.
The right leg must have been raised, naturally deeply bent at the knee; we only have
its foot, but this one, whose sole must have fully touched the ground, could not
72590 possibly have belonged to a leg positioned differently. The monster is already
beginning to sink somewhat, especially at the side of his enemy, but still offers
formidable resistance. With his left hand, he grasps the other's right hand to push
away the arm that clamps around his neck and threatens to strangle him. The chlamys
has slipped from his shoulders and sinks between him and the Centaur behind the
72595 raised right leg. Much is missing from both figures; of the Lapith, for example,
nothing remains of the entire torso other than the right arm and right shoulder.
Next to Theseus stood a Centaur, who was stealing a flowering boy; Pausanias mentions
it. The robber emerges diagonally from the facade wall to the right, so that, as with
his counterpart, a large portion of the body remains, as it were, inside. This is
72600 evidenced by the largely recovered half-horse body, which, as far as we can judge,
fitted smoothly against the facade. Of the poor boy, nothing remains but the armless
torso and a piece of the right leg. Behind his back, the Centaur's right arm extended
under his right arm. The monster's finger is visible under the armpit; the rest of
the hand and the arm, along with a piece of the chest to which it was attached, have
72605 also been found. The boy appears to have resisted and, like his counterpart, to have
grabbed the monster around the neck. No body parts of this one have been found,
except for the one mentioned.

Next, on either side of the facade, next to the Lapith, who is trying to strangle his
opponent, and the blooming boy, is a Centaur, who has turned towards his enemy,
72610 towards the corner of the facade, but is also trying to hold his prey. Next to the
Lapith, on the left side of the facade, is a girl, kneeling on her right leg, turned
towards the viewer. The Centaur has attempted to wrap his left paw around her. This
was done very roughly; her chiton was torn from her left shoulder, and now the
horse's hoof is pinching her in her lap. She is afraid the centaur will lift its hoof
72615 to encircle her more tightly, and that it will then come in her face; therefore, she
probably held her left arm, which is lost, between the two. She was not seen
completely from the side, because she had apparently turned slightly forward to push
herself off the centaur with her right arm, which is also lost, in order to escape
the encircling leg. Only very small fragments remain of her head. The same is true of
72620 the centaur's, of whom we otherwise have only a large piece of the horse's body and
small parts of the right foreleg and left hindleg. The Lapith, which is fighting him,
probably Caineus, leans forward quite strongly, following the upright side of the
triangular gable. Only the forward-positioned left leg, a portion of the right, and
both arms are missing. Presumably, he grabbed the Centaur by the hair with one hand
72625 and held a dagger or sword in the other.

The Centaur on the other side, next to the boy's robber, has also moved toward the
corner of the facade.

He has turned his attacker, but he keeps his upper body forward, facing the viewer,
72630 as he still needs both arms to hold the girl he has kidnapped.
She tries with all her might to wriggle free; she has fallen slightly forward onto
her right knee, her back against the centaur; he has grabbed her by the left foot
with his left hand; he has tried to swing the right across the front of her body,
across her waist, but she managed to grab it with both hands before it even reached
72635 that point and is now trying to push it back with all her might. This excessive
effort, however, is no longer necessary. While the centaur was still busy easily
subduing her, so he could then turn on his assailant, the latter had already seized
the girl by the hair with his left hand and, passing under the left arm with which he
had grasped the girl's foot, with his right, plunged a dagger into her chest—the
72640 opening where the dagger was lodged is still visible in the centaur's body. Suddenly,
the monster collapsed, slumped deeply; its hind legs were still raised. The hero who
so decisively came to the girl's aid is missing his head and arms. The centaur is
missing only small pieces; the girl's head, but otherwise not much. She is wearing a
chiton and peplos.

72645 The two ends of the group are causing the most trouble. Right next to the last described centaurs and lapiths, an old woman must have lain on either side, presumably on a couch, such as was always used at banquets. At least a cushion has been found, which appears to have belonged to such a couch, and on which the old woman on the right side of the gable must have rested. We must imagine her lying

72650 prone on this couch, her face turned towards the battle, with both arms resting on it. However, only small fragments of both her head and her body remain. We are more fortunate with her counterpart, the old woman on the other side; only her arms and the lower parts of her legs are missing. She lies prone, still somewhat on her knees, and, like the previous one, probably rested on both arms. She was dressed in a

72655 chiton. This one, too, must have been lying on a couch or something similar, if she were to flank the other. One could then see her standing on the ground below, looking up at her from below, and that is also where the sculpture is best crafted. Both old women were likely nurses of the kidnapped girls, and it will come as no surprise that they watched the struggle with anxious anticipation.

72660 In both corners lie two nymphs prone on the ground. The one on the right is resting on her elbows; the one on the left has removed her left arm slightly from under her head to pull up her chiton, which had slipped over her right shoulder. The main thing missing from this nymph are both arms; of which only the left hand, which pulled up the chiton, has been found. She wore a hood or cap. A similar one also had her

72665 counterpart; however, only a fragment of that remains. It seems that the two ends of the gable group cannot be composed differently, and yet it is almost impossible to assume that this composition is entirely correct. How could an artist, who achieved such variation in his pendants, have allowed his group to develop into two figures on either side, both leaning forward, one slightly higher

72670 than the other, as if in two parallel lines extending in line? This has not been concealed in Berlin either, and experiments are still being conducted with our group in the glyptothèque there. Yet, in its main features, it must be composed as described above, following in the footsteps of Dr. Treu.

72675 One immediately senses that there is a certain correspondence, a so-called parallelism, between this group and that of the facade. Both represent the victory of civilization and gentler morals over barbarism. In both, the case is decided by the appearance of a god; on the front it is Zeus, on the back his son Apollo. In both corners, deities lie watching the spectacle. Behind the horses of Pelops and Oenomaus sits an old man on either side; Like those on the east facade, the two old women on

72680 the west facade are deeply interested in what's happening. Yet, despite all the similarity, there's also a striking difference. As calm and solemn as the front is, the scene on the rear facade is equally powerful and moving. Let us now return in our thoughts to the front of the temple, to walk around the gallery between the columns and the walls of the inner temple building, and then

72685 enter it itself. To do so, we ascend the five-staircase staircase.

The projecting projection at the temple's pedestal, which is located here in the center of the facade, extends over the wider steps of the front. If we pass between the columns, we enter the gallery, walking on the simple pavement of pebbles covered

72690 with a kind of plaster. The gallery had a ceiling, probably of wood, between the back of the geison and the wall of the temple house. Under such a ceiling, a row of triglyphs and metopes was often placed around the walls. This was omitted here, probably for cost reasons. Only at the front and back, following the metopes, were plaques with reliefs depicting the twelve labors of Heracles.

72695 Where were these more appropriate than here, at the sacred place where the Greeks, as his followers, competed for the prize of victory in the contest he instituted? Let us begin our examination with the northernmost relief on the back, for it seems they wanted to maintain a historical order in the sequence of the works, and here the young hero appears completely beardless. He has slain the Neimeian lion and, having

72700 placed his right foot on the monster—this, at least, was most likely his posture—he rests his head on his right hand, while his elbow rests on his raised knee; he turns his face forward thoughtfully. Several pieces of these metopes were already unearthed during the French expedition, and this one is also preserved in the Louvre; the head of Heracles has now been found among them.

72705 In the next relief, Heracles fights the Hydra, the many-headed serpent, each of whose heads immediately regenerated after being severed. The monster curls from the left side of the metope to the right and raises its body along that right side; many heads have already been severed, but others are still rising. Heracles appears from the left. This metope probably also depicted Ioloas, who, according to the story, had set

72710 fire to a forest, using the burning branches to burn out every stump where a head had

been severed, to prevent regrowth. The Hydra, however, occupies the largest space in this relief.

In the adjacent one, Heracles shows his friend Athena, who is seated on the left, a pair of those Stymphalian birds—animals with iron wings and feathers as sharp as arrows, which even ate humans and had made the Valley of Stymphalus in Arcadia unsafe. Heracles, however, chased them away with the sound of an iron rattle and then killed them. Now he shows the goddess one of the birds with his right hand; another seems to have hung down along the body in his left, at the viewer's side. The most important pieces of this relief are in the Louvre. The same applies to the subsequent Cretan bull, which, however, owes its head to German excavations. Heracles had to transport this animal from Crete to Mycenae. The background of our relief is almost entirely occupied by the bull, which moves from the left to the right side, but is diverted by Heracles, who stands in front of it and moves in the opposite direction, from the right to the left, with his left hand by the head. The hero leans slightly forward, so that one can see that he has difficulty in pulling the animal along. The next relief depicted Heracles pursuing the Cerynite stag with golden horns and copper hooves. The moment seems to have been chosen when he came to the side of the animal from behind and grabbed it by the horns; because it still wanted to run, its head is pulled far back. The row at the back of this image was concluded by a depiction of Heracles' battle with the queen of the Amazons, from whom he had to take the belt given to her by Ares. Only the head remains, which, it seems, was dragged down by the hair.

If we walk around to the east side, the first relief on the left presents one of the most beloved depictions of the Greek common prostitute. The story usually has Heracles performing his labors in the service of King Eurystheus. However, Eurystheus actually became king entirely by chance instead of Heracles. Just as our demigod was about to be born, Zeus declared to Hera that he who would first see the light of day from that moment on would be king. The goddess, jealous of her husband's natural son, then temporarily prevents Heracles' birth and brings Eurystheus into the world as quickly as possible, though before the appointed time. In this way, the clumsy seven-month-old child becomes the ruler of Greece's greatest hero; no wonder the lord was never quite at ease with such a servant. Now he ordered Heracles to capture alive the wild boar that was infesting the area around Eurymanthos, a river in Arcadia.

The hero complies with this charge; but his master has reason to regret having given it. No sooner does his servant arrive with the monster on his back than fear overwhelms him so much that he crawls into a copper vessel. Heracles has noticed this and approaches the vessel, and here begins the scene on our metope, as it often appears on vases, objects of everyday use. The hero has placed his left foot on the vessel, grasps the monster with both hands, and threatens to throw it headfirst into it. The king pleads, rising from the vessel up to his chest, his hands extended towards his servant. The servant, however, apparently just wanted a joke. Some fragments of the figures in this relief are in the Louvre, some recently discovered, including the rim of the vessel with Heracles' left foot.

Heracles was to fetch King Diomedes' wild horses. The second metope on the front, according to the remains in the Louvre and those recently discovered, most likely depicted a horse that leaped to the right, but was diverted by the reins by Heracles, who passed in front of the horse to the left. The hero holds the reins with both hands; the horse's head, which is being pulled along, stands further from the background than the rest of the body.

The subject of the third relief is the battle with the giant Geryoneus. Geryoneus had three heads, each wearing a helmet, and three bodies, each covered by a shield. In our relief, Heracles has already defeated Eurytion, the giant's herdsman, and steps over his corpse from the left. The giant himself has also received violent blows from the hero, presumably with the club. He is, at least, on his knees. Heracles, continuing to strike, has placed his left foot on the giant's thigh. One head has already sunk, and the shield has slid off one arm. A large fragment of this metope can be found in the Louvre.

The next metope is the only one that has been preserved almost entirely. Heracles, completely naked and bearded, stands in the center, turned entirely to the right. A cushion rests on his bent neck, on which we can imagine the heavens, which are not visible in the relief; with his palms turned upward, he supports the burden on either side. Only her right arm, however, the one facing the viewer, falls into view. Behind him stands a woman, her body turned forward, her head in profile to the right. Her chiton falls in fairly upright folds; her peplos hangs over it. Her right hand falls

alongside her body, her left raised to support something with her palm; perhaps to lend a helping hand to Heracles. As far as I know, no one has yet been able to determine who she is. In front of Heracles, Atlas approaches him, showing him with his right hand the three apples of the Hesperides, which he had fetched for the hero while he carried the heavens for him. Atlas is also naked and bearded. Of the subsequent metope, which depicted the cleansing of the Augean stables, only Athena remains, wearing a helmet and a drooping chiton, watching her friend's labors. Following this is the hero's final labor; In this order, the Kerberos was brought out of the underworld. Little remains of it. Heracles seems to have dragged the animal forward from the left corner of the metope; so that it only partially appeared. His friend Athena stood beside him again.

With this, we had walked past all the metope reliefs. They, too, were provided with various colors, so that the different parts would stand out clearly; for example, the Cretan bull, judging by a few remaining traces of paint, was reddish-brown on bright blue. Even on the reliefs of the Hydra and the Nemean lion, some traces of earlier colors can still be seen. Now, however, we enter the interior of the temple itself and proceed first to the rear. There, the two side walls are curved into antebellums; between the two antebellums stand two Doric columns. It was probably possible to walk between them, or between one of them and an antebellum, without any obstruction. However, one then only entered the rear section, from where one could not penetrate the actual interior of the temple. It was, in a sense, a continuation of the surrounding gallery; the same pavement continued here. Yet, this rear section was intended for a calmer and more deliberate intercourse among the celebrants than that circuit. It was here, among others, that Herodotus read his stories.

However Now to the front. From there, one could penetrate all the way into the interior of the temple. Here, too, the side walls curved into anterooms; here, too, two Doric columns stood between them, but the three bays between these columns and anterooms were completely closed off by metal grating. The lower section, however, could be opened like a door, and through one of these doors we entered the so-called vestibule. There, all sorts of votive offerings caught the eye, not least the statue of a woman holding a wreath above a man's head. It was King Iphitos, crowned with the ekecheiria (God's peace), here depicted as a person. The pavement in this vestibule consisted of a beautiful mosaic of colored stones. A somewhat subdued light fell through the grating at the front.

Opposite the central entrance to the vestibule was the door leading to the actual interior temple space, the cella. It was opened; A bright light streamed down through a large opening in the roof, and in all its majesty and splendor, mortal eyes beheld the father of gods and men.

The colossal sculpture was composed largely of ivory and gold. The deity sat on a throne, which in turn rested on a pedestal. In large locks, his hair flowed on either side of his broad yet slightly tapering forehead; a rich beard encircled his chin and mouth; from the corners of his nose and eyebrows spoke imperious majesty. Around his head he wore a wreath like olive leaves. The Horen (times), which he rotates, and the Charites (joys of life), which he sends down, floated from the upper arm of his throne, one to one side, the other to the other, around his head. On his right hand stood Victory (Nike), descending from him, a statue entirely of gold; With his left, he held the scepter composed of various metals, with the eagle perched atop it. The golden cloak, which hung from his shoulders, was interwoven with figures, flowers, and animals. His feet, wearing golden shoes, rested on a platform covered in golden reliefs, depicting Theseus's battle against the Amazons.

On the high pedestal of the throne, as if representing Mount Olympus, numerous gods and goddesses, carved in gold, were depicted in various ways. Sculptures were also placed on the throne's legs: Nikes floated around them; the children of Niobe were struck by the arrows of Apollo and Artemis; Theban boys and girls were captured by the Sphinx. On the crossbars between the legs, numerous depictions of contests were depicted. Of the panels filling the open spaces between the legs, the foremost was darkly colored, the other three painted by Panainus, according to tradition a brother of Pheidias; on them, among other things, one could see Greece and Salamis, adorned with prows in their hands.

Thus, the formidable figure must have sat on Olympus when Achilles' mother, Thetis, came to him imploringly, and he granted her plea, as if with his eyebrows, his head only slightly moving in response; a wave spread through the locks on either side of his head: all of Olympus trembled. The artist's legend has Pheidias telling Panainus that the scene from Homer where this is described came to mind while crafting his

sculpture. It will come as no surprise that the artist, wishing to portray the supreme god in all truth, took him to great lengths. Mockingbirds said that if the god rose from his throne, he would necessarily have to take the temple roof with him. The artist had conceived of his task as the fulfillment of a higher mission. Centuries later, the place in the temple was pointed out where, according to the story, he had sunk down in deep reverence and asked the god himself for his judgment. There thunder rolls; lightning strikes right before him: the deity has spoken and set his seal on the work of man. Hellenic idealism had reached its highest point; perhaps no one who wishes to express the divine in the human can rise higher. The statue was lost—how, it is not known exactly—but the impression it had made in kindred spirits, the type the master had created, was perpetuated by subsequent generations, among others in works such as the Zeus of Otricoli. Centuries would still have to pass before Pheidias's great equal, Michelangelo, when he dared to depict the Christian God the Father on canvas, would overtake the Attic artist.

Let us now turn to the more mundane matters of this interior temple. On either side, a little way from the two side walls, ran a row of seven Doric columns, dividing the space into a large central nave and two rather narrow side galleries. The floor of the central nave had three sections. The front was paved with dark blue marble. This was followed by a second section, presumably separated by a threshold, of which no floor covering has been found. From a site by Pausanias, one seems to be able to infer that this section was also dark. The final section, also separated by a threshold, followed this section, which, according to the same site by Pausanias, must have had a light-colored pavement. The middle section was probably just below the opening for the light in the roof. Falling rainwater was then collected there, preventing it from flowing freely through the temple; there must have been drainpipes to the outside.

From the second column on either side, a metal gate, reaching a certain height, ran between all the columns, the same between the two outermost columns behind the statue and on the threshold in front of the statue. Therefore, it could not be approached freely from any side. To reach it, one would enter the gallery between the first and second columns, open a door, and thus enter behind the gates. If one went around, one would exit through a similar door on the other side. Opposite both doors were stairs that led to the upper gallery, which rested on the columns of the gallery below. From there, too, one could likely walk around the statue. If one went even higher, via a spiral staircase, one would reach the roof, from where, above the buildings of Olympia, one had an unobstructed view of the green hills of the landscape and, perhaps, on the western horizon, could also glimpse the distant blue of the Ionian Sea.

We descend and leave the temple. Here we have seen a building from the heyday of Greek art, the age of Pericles. Until now, it was generally assumed that the temple was built much earlier, and that only the sculptures of Paionios and Alkamenes were added to the facades around the middle of the fourth century. This now seems untenable. Around the temple, the footpath, which was used during the heyday of Hellas's greatness, can still be seen. As they dug deeper, they came through a layer of yellow sand and fragments of stone, clearly building rubble, and then first to the black subsoil. Now, most of the statue pedestals here have been placed on top of this layer of sand and building rubble; a few others—one of which is very clear—originally stood on the black earth and, when the new layer was cast over it, remained in place, so that a large section, which had been shaped to be conspicuous, was buried under the earth. These latter pedestals, as the lettering of the inscriptions indicates, were erected before the latter half of the fifth century, the others later. It seems therefore clear that an earlier temple was demolished around the middle of the 5th century or slightly later. Some of the remaining rubble was covered with yellow sand, and the new temple was built on top of it. The pedestals that already stood around the old temple were partially placed under this new foundation, while the later ones were placed on top.

The architect Libon, a man from Elis, was then a contemporary of the Attic masters and collaborated with them. He also seems to have benefited somewhat from his association with them; at least in a few minor architectural details, Attic style is believed to have been observed. However beautiful the building may have been, on the whole, the high nobility of form, such as that seen, for example, in the Parthenon, was not achieved here. And this also applies most eminently to the sculptures of the Attic masters themselves. The treatment of the clothing is broad, that of the hair, for example, of Apollo, rather old-fashioned for that time, while the ingenious conception of the western group and the quiet solemnity exuding from the eastern

group make us feel that we are dealing with works by great masters. This observation about the method of workmanship applies no less to the metopes, which, while seemingly made according to the Attic model, those of the Temple of Theseus, nevertheless possess an unfashionable breadth and sometimes even a somewhat clumsy quality. In their workmanship, they also offer similarities to the facade of Paeonios. But that same master had a statue (a Nike) placed directly opposite the Temple of Zeus, with noble forms and much better treatment of the clothing. The question, therefore, is: why did these masters pay so little attention to the detail in the execution of their beautiful compositions? One might answer that such fine work was unnecessary for statues placed so high. But again one might ask: what about the facade sculptures of the Parthenon? One could answer to this, however, that the Eleians were indeed wealthy landowners, but not if the Athenians had a treasury of allies at their disposal. If one considering the substantial costs incurred for all these works of art, one can understand that, wherever possible, they economized somewhat, and therefore, in the case of higher-ranking statues, where the main concept was more important than elsewhere, less care was given to the elaboration of the details. For example, hadn't reliefs, out of economy, only been applied to the fronts of the temple house, and wasn't the surrounding pavement more neat and clever than beautiful? Perhaps the masters worked out their compositions somewhat hastily, here and there even based on outdated schematics. How recently Pheidias' school had left them behind! Perhaps these works were also produced under their direction, by others, possibly Eleians; But if this were the case, then, especially in the western group, the master often took the chisel from the pupils' hands, or among these, like Van Dyck among those of Rubens, there was probably a genius who remained in the making. Even in its details, for example, in the grips of some of the hands, this western group often possesses striking dramatic power.

Among the votive offerings, just before the temple, stood the Nike of Paionios, already mentioned. From an oblong round slab, the column rose upwards with ten stepped constrictions, on which the goddess was placed, almost six meters above the ground. She seemed to descend with an eagle beneath her; her wings were raised at her shoulders. The thin robe is fastened above the right shoulder, so that the left arm and bosom fell outside. Due to the rising air current caused by her descent, the dress clung closely to the body at the front, and it appears that it blew backward in broad curves on either side. In her left hand, she likely held a wreath aloft, raising her shoulder somewhat. Arms, head, and left lower leg, wings, and a large piece of the dress were initially completely missing. Only smaller fragments were found later. An inscription states that the Messenians from Naupaktos erected it from the spoils they had captured on "enemies" and that Paionios from Mende, "the same who triumphed with his designs for ornaments on the temple facade"—among them, of course, a Nike—had made it. According to a story from the Messenians, which Pausanias heard recount and which is highly likely, these enemies were the Spartans, but their influence was still so strong at Olympia at the time—the Messenians also related this—that they did not dare to inscribe that name on it. Later, they were less hesitant. When, at the behest of the Romans, the Milesians had won a border battle between the Messenians and their long-standing enemy, three large deeds relating to this were engraved on the column.

We leave the terrace of the Temple of Zeus and proceed through a whole row of sculptures to the eastern part of the Altis. There stood two buildings, a smaller one on the southeast side and a very large gallery north of it. Shortly behind these buildings, the eastern Altis wall appears to have run. This area is still little known. This smaller building stood on a pedestal with two staircases. Ascending it, one entered, through a row of columns, a gallery that encircled the building itself on its long front and narrower sides. This gallery consisted of four rooms; the space between the columns of the gallery could be closed off by metal gates. It is not unlikely that this building was the town hall of the Olympic Council.

The large gallery on the north side was the so-called Gallery of Echo, also called the "Multicolored" because its closed back wall was painted with numerous depictions. It rose quite high above the ground floor via four steps of Parian marble; it was 100 meters long and 10 meters wide, so that from here at least 2,000 people could watch the sacrifice ceremony on the large altar opposite, passing between the Ionic columns at the front. The two sides of the Gallery of Echo were also closed. If one turned around the Echo gallery on the north side, one came across a sort of gateway, consisting of two pedestals shaped like half-columns, and between them two actual columns, all Ionic, and indeed of very old design. Between the actual columns was a door; the space between the columns and pedestals was filled to a certain extent by a stone wall. This was the gateway to the tunnel-shaped, so-called "secret" entrance to

- 72975 the camp, the stadium.
From there, if one went somewhat westward, one came across the so-called Zanes, a plural of Zeus, statues of the god, erected from the fines with which they had been burned.
- 72980 Rafts were discovered, those who had offended the Deity during the battle, for example, by bribing the opposing party or accepting bribes. The pedestals of these statues have been found.
Then came a temple called the Metroon, that is, the temple of the Mother of the Gods. It was a Doric peripteral temple, like that of Zeus, but much smaller, barely a third
- 72985 of its size. It also rested on a pedestal with three steps. It was probably built in the fourth century BC, and the remains discovered greatly increase our knowledge, especially of the Hellenic ornamentation of the buildings. The colors blue and red were also used to more clearly highlight certain architectural elements. During the Roman Imperial period, this temple was gruesomely renovated. It was then given a new
- 72990 plaster, one several centimeters thick. Our restorer deemed all sorts of fine ornamental details, such as the drops under the Geison, superfluous and either discarded or plastered over without prior treatment. Then it—the temple of the Mother of the Gods!—was converted into a pantheon for Roman emperors. It was still more appropriate than that of Zeus or Hera (more on which later). The emperors enjoyed
- 72995 divine honors in the provinces, even during their lifetimes, in Rome itself only after their death. It was certainly not indifferent to the Romans that a place of veneration was also reserved for these divine rulers of the world empire at the most important Hellenic sanctuary. Yet, the idea needn't have occurred to the Romans. At that time, the Greeks were sufficiently courteous to the Roman lords, and especially
- 73000 to the emperor. With a certain common enthusiasm, that degenerate race seized upon every conceivable honor to heap upon the head of the mighty, and they even assumed a pose as if they had accomplished something great.
- 73005 Of the statues of the emperors that once stood here, several have been recovered, specifically in the temple itself. One of these statues, which initially lacked a head, was elevated to Zeus because an eagle stood beside it. Dr. Purgold was the first to observe that the marvel strongly resembled a Claudius, recently unearthed at Civita Lavina. When they subsequently attempted to place the head of that emperor, which had been found a considerable distance away, on this torso, it fit perfectly.
- 73010 Similarly, a head of Titus fit on another torso. Both statues are exquisitely carved. Nearby, a statue of a woman was also found, probably of an empress, also headless. A woman in barbaric attire was also unearthed here, kneeling with her hands behind her back, probably the personification of a subjugated province bowing to an emperor. Of this woman, only part of one leg remained standing, but a corresponding torso has now
- 73015 also been found.
North of Zanes and Metroon, Pausanias saw a whole row of small, temple-like buildings, so-called treasuries, houses that various states or rulers had erected there to house their gifts to the God. They lay with their backs flush against Kronos Hill and rested on a raised foundation. Few buildings in the Altis region, however,
- 73020 have been as damaged by the ravages of the elements and humanity—often no more than an element—as this one. Even its foundations have not been completely left untouched, although a large portion of them can still be found. Fortunately, one of these treasuries was only destroyed by a landslide from Kronos Hill, so there are enough remains to allow for some reconstruction. It was a carefully crafted building, not
- 73025 only resting on a pedestal with two smaller and one larger staircase, but also the walls tapered gradually, with very narrow and increasingly narrow steps leading upward. One entered a porch between two Doric columns and two anterooms, and from there into an inner room—the same arrangement, it seems, as in most of the other treasuries. This was the so-called Carthaginian treasury, that is, the treasury that
- 73030 Gelon, the tyrant of Syracuse, had built at the beginning of the 5th century BC from the spoils taken from the Carthaginians.
The later inhabitants of the Valley of Olympia constructed a large fortified square from fragments of architectural and sculptural pieces. From the western wall, various blocks, fragments of columns, a few capitals, pieces of reliefs, etc., were
- 73035 recovered, which had been piled up inside and appeared to have been broken away from a building. After some investigation, it turned out that this building must have been exactly the width, judging by the foundations found, of one of the treasuries, except for one.
- 73040 The last in the row, according to Pausanias, that of the Megarians. In the facade of

this treasury, he also saw a relief depicting the battle of Gods and Giants, and this was entirely consistent with the fact that among the numerous remains found, there were also relief plaques. When, finally, one was found among the blocks, broken off at the end, right through the fourth letter of the word Megara, or Megarians—a block that also seemed to have belonged above the entrance to the building—the matter was settled.

It was a carefully crafted building. The facade rested on two antae and two columns. Below the geison, a frieze of limestone reliefs ran around the entire building; this was also found in the facade. The spaces between the antae and columns were filled with metal grating, through which one or more doors must have led to the vestibule, which led to an inner room twice as large as this one. The building is a human age older than the Carthaginian treasury; it was certainly built no later than the end of the 6th century BC. How such discoveries complete all the links in the chain of Greek architectural history is understandable.

Dr. Treu has been able to reconstruct the relief on the facade with a degree of probability that allows one to form a fairly accurate assessment of the composition. In the center stands Zeus with a Giant, who has already fallen to his knees. To his right, Athena and Poseidon are fighting, and to his left, Heracles and Ares, each also with a Giant. In the corner, in front of the viewer on the right, a Giant lies flat on the ground, his helmet turned towards the corner. Flanking him is a sea creature, which comes from the left corner to assist Poseidon, the god of the sea. One of the best-preserved pieces depicts the Giant battling Heracles. He has fallen to his left knee, the one facing the viewer; his right leg is still standing; he tries powerlessly to defend himself. Heracles, who is fighting him, has already placed his left leg beyond the Giant's right and will soon have completely defeated him. Here we have before us a very ancient example of the art of grouping; with childish naivety, for example, one thinks it is enough to place a sea creature opposite the prostrate Giant.

According to Pausanias, the first treasury on the left was that of the tyrant Myron of Sicyon. Next came that of the Carthaginians. Now that the foundations of these buildings have been uncovered, there is one fewer than the Greek travelogue; yet, according to the most recent reports, remains of them have also been found. Right next to these treasuries, on the west side, stood a building that was only erected a year or so after Pausanias's visit to Olympia. A wealthy and generous man from Attica, who achieved great respect in Rome, Herodes Atticus also indulged his almost manic passion for building at Olympia. Numerous buildings by him are mentioned. When his wife Regilla later died, he had his house painted black, black carpets and curtains installed, and other parts clad with black marble. He loved his Regilla dearly, and it was through her that he had a large aqueduct, which branched off into the sacred area with various branches—it has been found everywhere during excavations—donated to the sanctuary. This was a great blessing for Olympia, and it was noted, as if living in our age of hygiene, that not only would one now be able to quench one's thirst with proper drinking water in the sacred area, but that Olympia would also suffer less from disease. The elongated main reservoir, into which water flowed from both sides of the hill of Kronos, was connected to an elegant building, a so-called Exedra, a building where one could comfortably indulge in disputing—a very favored pastime at the time. Herodes Atticus himself was also a rhetorician. Next to the reservoir, on either side, were two small, round buildings, probably containing two statues, perhaps those of Hadrian and Antoninus Pius; of the former, the torso and head were found, of the latter, only the head. Slightly higher than the reservoir and behind it, the two round buildings were connected by a semicircular building; here, too, niches were placed for statues of the imperial family, several of which have been recovered in relatively good condition, including one of Faustina, the wife of Antoninus Pius, though the lower portion of her statue has broken off above the knees. All the images of the Exedra prove that if one built as much as Herodes Atticus, one had to compromise considerably on the demands of beauty. In that semicircular building, they had an unobstructed view of the great altar of Zeus. In front of the reservoir stood a rather carelessly carved marble bull, on which an inscription stated that Regilla had donated the aqueduct and the accompanying building to Zeus. Water flowed into the reservoir through the open mouths of two lion heads at the rear.

Close to this Exedra stood the temple of Hera, the Heraion, so closely attached to a small hill next to Mount Kronos that one could not walk around it on the north side. It was, as it were, the counterpart of the temple of Zeus on the other side of the great altar and had already stood there at the same time as the temple, which had been demolished in the latter half of the 5th century; the foundations of the new one

were then brought to the same level as his. Although they belonged together, that of Zeus's wife was somewhat smaller. It also had a less grand appearance from the outside; The pedestal rose by two rather narrow staircases; there was no trace of sculpture in the facade. One did not enter the temple from the eastern front, but on the south side, two separate staircases had been placed in the pedestal at either end, allowing access to the gallery surrounding the temple house; for this, too, was a Doric peripteral temple. If one walked under this gallery to the north side, one could exit the temple there, near the rear front, via a staircase leading to the heights beside Kronos Hill. The Eleans certainly considered replacing this temple with a new one; however, they contented themselves with renovating it whenever the opportunity arose. Whenever one of the old oak columns became unusable, it was replaced by another of stone; however, Pausanias still saw a wooden one at the entrance to the rear of the building. This explains why the stone columns varied considerably in size and design. The fact that columns of wood and stone stood side by side presented no problem, as they were all covered with the same fine plaster. On the emergency side, where the temple could not be accurately measured at the time, it was not even considered necessary to align the columns on the outside, even if they were of different sizes. The Doric column usually has twenty flutes, but sometimes sixteen, and here too, one with sixteen can be found on the north side. Such columns are of the oldest form and very remarkable for art history. The Doric column is also of Egyptian origin. When ancient dwellings were hewn from rock, square pillars were left as supports for the upper vault. Later, they were also used in buildings above ground. However, the corners were often cut off, so that they became octagonal; in the same way, they were then converted from octagonal to sixteen-sided; the flat sides were also soon grooved and made into flutes. The Greeks wanted more flutes, but 32 was too many; they started with a pentagon and thus arrived at twenty. Columns with sixteen flutes, therefore, reveal their origins much more clearly than those with twenty. Traces of votive offerings placed against the columns in the gallery can still be found on the columns, which must have stood on the east and south sides of the temple.

The temple house had no antennæ, meaning the side walls did not curve at the front or back, so that those walls were visible in cross-section. Two columns also stood midway between these ends of the walls, and the spaces at the rear of the house were filled with metal grating, so that only one door provided access. Entering the interior temple space through the front house certainly gave a completely different experience than entering that of the Temple of Zeus. On a throne sat the Goddess of Heaven, presumably with two gods beside her, one of whom was likely Zeus herself, the other possibly Ares. They were looking at a very ancient work, made on the site of Olympia itself; at least the yellowish-white limestone in which it is carved is found near Olympia. It is a product of Greek art, as it first began to become independent of Egyptian art. The hair flows in perfectly even waves on either side of the forehead; this is followed by a band, and atop the head is a round headdress, made up of several elongated pieces, closely fitting together on the long sides. It was precisely under the Saitic dynasty, during the 7th and 6th centuries, when Greece most experienced the influence of Egypt, that a kind of headdress for Isis-Hahor came into use in that country, consisting of a combination of Uraeus serpents, symbols of royal dignity, topped with two horns. also the Leiden Museum has several examples of this. Hera's headdress is clearly derived from it; only the horns have been omitted, unless, which is difficult to judge from a drawing, an unevenness on one of the sides is the remnant of a broken horn.

The interior construction of the temple was also very ancient. Only during the Roman Imperial period were columns added here, which, running parallel to the side walls, divided the temple house into three sections. Before that time, niches had been built on these side walls, traces of which can still be seen. That these belonged to the original design of the temple is clearly demonstrated by the fact that the side walls of these niches, which stood at right angles to the side walls, were completely aligned with the outer columns, but in such a way that one column was omitted each time, and each niche had the width of twice the distance between two columns. The niches were therefore designed at the same time as the exterior structure; Had they been added later, a seemingly unnecessary agreement would not have been so easily arrived at. These niches were probably covered with wood. The numerous votive offerings that stood in this temple were undoubtedly placed in them. The ancients were particularly interested in the so-called chest of Cupselos, the Corinthian tyrant, painted with all sorts of scenes from Greek legends and myths. It was a very old work. According to tradition, the tyrant's mother had hidden him in this chest from the eyes of his attackers shortly after his birth. In

one of these niches also stood the Hermes by Praxiteles. The majority of this work has been recovered. We have already noted that not a single original piece by him, nor by any other representative of the art movement, of which he was one of the greatest coryphaeus, has survived. Imagine, for a moment, that after two thousand years a work by Rembrandt van Rijn was unearthed, after having known him until then only through the stories of his ancestors and imperfect copies.

The gods of Praxiteles are much closer to the ordinary human world than those of Pheidias. When the Greek, especially after the battle against the Persians, felt a noble sense of self-worth, and humanity seemed to him a revelation of dignity and strength, the gods were the most sublime example of that human splendor. In the time of Praxiteles, however, when civil wars had destroyed the states, when their Asian brothers had been delivered to the Persians, when no state in Greece anymore set an example of devotion to higher principles, when freedom itself was soon to perish, to perish through its own fault, how could such a belief in itself have been possible then? Yet all was not yet lost; Youth and sweet beauty still shone in their full splendor, and because of this, the human figure, even though the more powerful striving for higher things had departed from the soul, remained a captivating image for the sculptor. Now, too, the artist's eye was more fully opened to humanity as it presented itself when pain torments or passion drives him onward, and although art had, if you will, descended into lower spheres, this was amply compensated for by greater versatility.

Praxiteles, however, felt drawn above all to that gentle beauty, and his gods reflect it in great perfection. One could call him the artist of blossoming beauty in comfortable tranquility. The famous sculptor Cephisodotus was most likely his father and teacher; It has been strikingly noted that his Eirene (Peace) with the child Pluto (God of the Underworld), of which the glyptothèque in Munich possesses a beautiful copy, offers a certain similarity in composition to this Hermes and the child Dionysus (the God of Wine); indeed, an ancient writer, Pliny, reports that the father also developed this same theme. According to the son's depiction in his sculpture, the young god has thrown his chlamys onto a cut-down tree trunk, which stands upright in the ground, down which it falls in numerous folds, casting all sorts of shades of light and dark over it. He himself stands beside this tree trunk and leans on it with his left arm, thereby slightly bending his right hip outward. On this left arm now sits his divine foster-child, whom he was once supposed to have taken to certain nymphs for rearing. In his hand the god clutched the herald's staff, which had broken off, probably because it was covered in precious metal. The young Dionysus hangs the little Chlamys on his right hip; on his left side it has slid down a little further. With his right foot he rests on the stump of a branch cut from the tree trunk; the left hangs freely. With his right hand he holds the shoulder of his nurse. Now he throws his head back a little, and he turns his head back, slightly bending it toward his left shoulder, so that he can see something in Hermes's face, which he held in his raised right hand, past his head. The god's mouth is drawn into a soft smile. He isn't really occupied with the little boy. He looks straight ahead, tilting his head slightly to the right, and is apparently in that state of comfortable repose we mentioned above, while meanwhile the little god goes about his business quite happily. Therefore, I don't think it's very likely that he, as one might think, held a bunch of grapes in his raised hand for the child. He would have been playing with the little one, as it were. It's better to assume that he had something in his hand, and when he picked it up, he wasn't thinking of the child, but that he happened to find it beautiful. What this was, however, is difficult to determine. Besides the right arm, a large part of both legs is also missing. The foot of the right has also now been found, which wears a sandal but has no wings. Here the artist deviated from the ancient mythological representation. The child is missing both arms; only the hand on Hermes's shoulder is still visible on the right; he must have extended the right arm towards the object in his right hand.

The god's body is sculpted with great mastery. The fluffy transitions of the muscles cast numerous delicate shadows across it, and the skin is soft and lustrous. The hair is cut short and stands out clearly against the clear skin of the face. He appears to have worn a wreath. That this god was quite close to the human world is already evident from the fact that he is only slightly taller than the average human height. Dionysus, on the other hand, is exceptionally small and must, on the other hand, look far too old for his age. The cloak is finely sculpted; the head, it is said, is of very average height. The long hair is held back by a band. The fact that some parts are less carefully worked, including Hermes's hair—but mainly at the back—has led some to claim that the work is not by the great master. Pausanias, however, assures us quite unequivocally, and at Olympia, where he inquired about all such things, they

were well aware of it; the supposition that a namesake of the famous Praxiteles would have created it is highly improbable. But why not Praxiteles himself? Has it never happened before that a great master neglected certain parts of his work to elaborate others with great passion? Praxiteles was an artist who seems to have worked very extensively; isn't it in the character of such a person, once he had satisfied himself with elaborating on what was most important to him in his conception, to find it tedious to continue working on his work? He apparently heard while working that it would be placed in a niche and was working on the back. He then immediately left; the chisel marks are still clearly visible on the back, and professional sculptors assure us that this shows he must have used tools exactly the same as those used today. This placement in a niche, even a wide one, certainly explains the less careful work on the back of the head. Between the left leg and the tree trunk, the statue was supported by a crossbar, which, presumably, only needed to be used during transport, but was accidentally left in place. The statue probably stood on a not very high pedestal, the bottom plate of which has been found. We will never see the work completely as it was. It was painted, according to some traces, and it is impossible to determine how. After taking another look at two tables, which, judging by deep grooves in the stones that formed the floor, must have stood in the temple's porch, we leave it on the south side. Northwest of it lies the Prytaneion, where, among other things, the victors in the games were entertained at the expense of the Eleans. Nearby is the small, elegant, round temple that Philip of Macedonia, after defeating the Greeks at Chaeronea, had built in his honor: the Philipion. But the Temple of Hera was above all an excellent starting point for strolling past the hundreds of sculptures, mostly statues of victors, placed in the open air. One then proceeded from the south side of this temple, behind the aforementioned large altar to Zeus, which, it was said, was formed from the ashes of sacrificial animals. Ashes from this altar are found. Then one passed the sanctuary of Pelops (Pelopion), an unwallled open space dotted with statues and trees. The entrance was on the west side. One continued between this Pelopion and the Temple of Zeus to the western Altis wall. Then one walked around the terrace of the Temple of Zeus, always passing sculptures, until one reached the western wall again. There presumably lay the Hippodamion, also a walled area. Parallel to the southern Altis wall stood another row of statues. If one passed the southeastern main entrance and then walked north to the column of the House of Oenomaos, well known to us, one had passed almost all of them. Many pedestals of all these sculptures have been found, but few of the statues themselves. We have already mentioned the Nike of Paionios, which stood on the terrace in front of the Temple of Zeus. Of the statues of victors, we have the remains of three: a very moderately carved marble head; a head that, in its carving, bears a strong resemblance to the Aeginites and thus dates from the early fifth or late sixth century. A shield with a fragment of an arm was also found, the edge of which, covering the chin, fitted this shield to the head. On the shield, Phrixos is depicted with a ram; it is known that he escaped with his sister Helle on such an animal, but the latter drowned in the Hellespont. Now, near the column of the house of Oinomaos, Pausanias mentions a statue of Eperastos, who, in the inscription he mentions, boasts of being of the lineage of Melampos. Melampos was related to Phrixos. This head is therefore likely that of Eperastos, and a kind of heraldic symbol appeared on his shield. The third find is the head of a pankratiast, or boxer, as indicated by the ears, which in such individuals were fused together by scars. It is beautifully crafted from bronze and striking because of the realism with which the anything but gentle appearance of such a fighter is depicted. This suggests that a Pergamic or Rhodian artist from the last centuries BC made it.

In an area like Olympia, one naturally also saw many beautiful or important smaller objects. I would like to mention a few that have been found. One is a small statue of a female deity, sculpted entirely in the Egyptian style; the arms are held straight along the body, and in each hand she holds a serpent. It is believed to be one of the Erinnyes, goddesses of fate, but a very old one. New evidence of the Semitic influence that must have had on Greek art has also been found at Olympia. The most important is a piece of bronze, which must have belonged to a cauldron or something similar, on which, among other things, stands Artemis, the goddess of the hunt, with wings and two lions beside her, who still bears a strong resemblance to her Asian predecessor, Anaïtis or Anahita; a piece of light 2,400 years old.

Thus Olympia, "the mother of the shining garlands, was the place where merit was truthfully judged, where soothsayers deduced from the smoldering morsels of sacrificial meat whether one would acquire masculine virtue, whether one would find relief from the pressure" through the glorious consciousness of having achieved

- 73305 something noble through the exertion of one's best efforts. "We humans are like those of a day. What is someone, what is someone not?" Today we are this, tomorrow that. "Man is the dream of a shadow. But when the splendor that comes from the hands of Zeus (victory) descends upon him, then a brilliant light shines for him; blessed then is his life." Thus, it was a sacred place here, where one sought solace and comfort,
- 73310 and felt momentarily weak. The long line of illustrious ancestors, past whose statues one walked, was inspired by their example with renewed vigor. When a rhapsode recited the second book of Homer's Iliad, and had reached that section where the various tribes and kings who had participated in the war against Troy are mentioned in great detail, every Greek listened attentively until the name of his people was mentioned
- 73315 and the illustrious heroes were mentioned who, even after so many centuries, still made up the glory of their tribe. So, no Greek entered the region of the Altis without being able to point out at least a few victors among all those statues, whom he could count among his own, to a greater or lesser extent. One might also call Olympia an art museum; if art had not been fully integrated into life here, as
- 73320 everywhere in Greece. Olympia was always important for the Greeks, but at certain times more so than at others. For example, one might find that the sacrificers would ask the god for an oracle; one could be present on that day of the month when the Elian priests performed their oracles.
- 73325 An ancient sacrifice, consisting of incense, flour, and honey, was circulated in a fixed order around all the approximately 70 altars that stood within the sacred area. But whatever it might have been at other times, everything was surpassed by Olympia, as it was during the great festivals every four years, when it showed itself in its most glorious form, far outshining everything of that kind in Greece, "like the sun
- 73330 the other stars."
- We will attend such a celebration in the final section of this essay.
Leiden.

(Conclusion to follow.)
- 73335 Olympia. (Continued from p. 114.)
- III.
- 73340 The end of the four-year period, which would be concluded by the great festival of the Eleans at Olympia, was approaching. Everyone could easily calculate how far they were from that date; The festival began five days before the arrival of the full moon, which fell closest to the summer solstice every fourth year, ending precisely with that full moon. About a year before that time, various champions in many Greek
- 73345 cities began to deliberately prepare for the Olympic competition. Gymnasts (leaders of the champions), fathers, relatives, and friends consulted whether their son, relative, or friend was truly trained enough to compete at a venue like Olympia. Only later did those who wished to attend the festival only as spectators make their travel plans. Finally, thirty days before the full moon in question, the so-called
- 73350 sacred month began; heralds of peace passed through Elis and subsequently also went to several other states to proclaim the Olympic Peace. This was an old custom that had lost much of its original purpose, but which, like so many similar customs, nevertheless served to add greater solemnity to the entire festival.
- 73355 For some time now, the governments and assemblies of the various cities had also been concerned with the matter. Who would be sent to the principal Hellenic sanctuary as theores—official representatives of the state at one or another religious festival abroad? Only wealthy individuals were eligible. While the states often spent large sums on their theores—embassies of theores—it was up to these theores to add even greater splendor to their appearances in the sacred domain, and many were eager to
- 73360 render service to their country and thus gain prestige among their fellow citizens. Now the state ships, which would transport the theores, also had to be rigged, and the multicolored tents were brought out to house them during the festival. The crowd could now admire the magnificent vessels that would serve for the state's sacrifices at the great altar of Zeus.
- 73365 Meanwhile, in Elis itself, on the first day of the sacred month, the prelude to the approaching festivities had already begun. In one of the halls of the city's large gymnasium, the judges and organizers of the competition, the Hellanodikas, held a meeting that day. From all sides, the champions who wanted to participate in the competition streamed in; anyone who did not arrive on that appointed day knew that
- 73370 unless they had very valid reasons for their absence, they would be excluded. When

registering, they had to be able to prove that they were a free Hellene, not a slave; that they had not been deprived of their civil rights by any sentence, had committed no crime against the gods, and were not stained by bloodguilt. Even those who might wish to claim that another did not meet any of these requirements were admitted to provide evidence. In Elis, the names of those who would participate in the competition were already being announced. They were becoming acquainted with them, or even renewing old acquaintances, as well as with gymnasts, relatives, and friends, for they had undoubtedly come more than once before.

The next morning was very early in Elis. Even before sunrise, the Hellanodiki left their official residence at the Elian market square, crossed it, and entered the large gymnasium through an entrance that led to it. Preliminary exercises for the great competition were about to begin, and these were apparently repeated every day. Things were stricter here than at the gymnasium back home. There was no friendly gymnast here with whom one could more or less arrange the exercises to their satisfaction; As absolute ruler, Hellanodike wielded the scepter, and anyone who refused to submit was excluded from the competition. The champions' own gymnasts were also usually present, but if they should ever interfere too much, a blow with the message from one of Hellanodike's servants quickly informed them that they were no longer on the grounds of their dominion. The exercises usually began early in the morning with the footrace; wrestling, boxing, and the like took place at noon. The sun then blazed brightly in the sky, and the sand from the Arcadian plains, often more undulating than that of Ethiopia, frequently blew into the Elian Gymnasium. Now, heat hardiness was one of the main requirements for the trained champion, but it soon became clear that only the most outstanding among the best could venture into these preliminary exercises at the Elian Gymnasium. The less suitable had, of course, long been eliminated before the actual competition began; at the same time, the various champions had become accustomed to each other.

Meanwhile, the quiet rural town became increasingly lively and bustling. People walk through the streets, through the market, through the Gymnasium: they want to see the men and youths who will soon fight for the greatest victories. It won't be long before the splendidly dressed theoreticians mingle with the bustling crowd. For many, however, Elis is merely a place through which they pass. The two roads to Olympia, situated to the south, are becoming increasingly crowded with pedestrians and chariots. Bustle and movement begin to prevail in the hitherto tranquil valley of Olympus and Mount Kronos. Around the Altis area, tents are being pitched, which they intend to rent to revelers. Peddlers display their wares there. There is also activity around and in the Palaestra and the Gymnasium, which must be prepared to receive the champions, just as the Leonidaion is for those theoreticians who were not allowed to bring their own tents. It is even possible that they could not all be accommodated in that building; In that case, beautiful, multicolored tents had to provide for further needs. For just as other states considered it their duty to send theoria, the Elean state owed it to its dignity to receive them well. And just as wealthy people contributed from their own resources to a splendid theoria, so too wealthy Eleans, not without their own financial sacrifices, undertook the reception of theoria in the name of the state. Amidst all this activity now mingles the increasing movement of the growing crowd of celebrators. As already in Elis, old acquaintances from various corners of the Hellenic world meet here. People walk together in the open air or in one of the many galleries in and around the Altis. What momentous events have occurred in each city since they last spoke! Everything is discussed that the Hellenic tribe from southern Italy to the Black Sea coast has experienced and enjoyed in recent years. But wherever the crowds bustle and swarm, nowhere is it livelier than in the rear of the Temple of Zeus. There, people debate all sorts of weighty and trivial topics; there, among other places, the Sophist Hippias of Elis delivered his speech, known to us from Plato, in which he boasted that everything he wore on his body was his own creation. His sister's grandson erected a statue there for him, the pedestal of which, bearing the inscription, has been recovered. It was also there, in that rear of the building, as we recall, that Herodotus read his world-famous history. Painters seized the opportunity to exhibit a new canvas there, as it were, for the entire Hellas assembled. The man, who had reaped laurels in the harvest here, could be certain that within a few weeks, his name would be carried to the four corners of the world by the returning revellers. It was like a miniature competition here, for male virtue in the arts and sciences. In the evening, however, the moon grows ever fuller in the sky. Finally, the full moon is only six or seven days away, and the festival is about to begin. The preliminary exercises in the Gymnasium of Elis have already concluded. The

Hellandodikes are in the Plethrion, a racecourse of that Gymnasium, to organize the procession of champions from the city to the sanctuary. Those who are the same age or were close equals in the preliminary exercises are placed side by side. Now it is well worth going to see the champions; they are all lined up here in squads. How much one admires these sturdy men with their proud, free bearing, in the full sense of their strength; the chosen ones from among the hundreds of thousands of an entire gymnastic-training tribe. People are also examined with the pleasure of connoisseurs. That powerful man there, particularly developed in chest and hands, but somewhat less so, as the others ones, whose body parts are concerned, is a "lion-athlete"; the other, whose legs are somewhat slender compared to the massive, awe-inspiring torso, is called an "eagle-athlete." Undoubtedly, among all these people there are also "bear-athletes," powerfully built individuals, somewhat stocky, not tall, more or less square; indeed, it is to be expected that among such a select group, one can identify the most striking representatives of each type. Now the procession sets off. Naturally, they follow the main highway, "the holy way." The theorias will also have participated in this official march to the Altiss. Numerous celebrants follow, others follow the road through the mountains. Elis is now completely empty. Finally, the main procession arrives at the sacred festival grounds over the Kladeos Bridge. The theores occupy the buildings and tents designated for them, while the champions are billeted in the Gymnasium and the Palaestra. As will be remembered, there was a wrestling arena and a racetrack at hand; never for a moment was there no opportunity to keep their limbs supple through exercises. The liveliness now reaches its peak. While many a pious offering had undoubtedly already been placed on one of the altars, now that number increases greatly; the champions attempt to win the gods' favor for the approaching contest; many a wealthy theores wants to honor his fatherland by displaying wealth and splendor; from what city is this man who brings such magnificent sacrificial animals to so many altars? What glittering golden vessels for washing hands, what a finely crafted censer! The day, probably after the arrival of the great procession, the actual festivities begin. The High Olympic Council is assembled in the town hall. There also stands the statue of Zeus, the upholder of the oath, as if in anger at the perjurer, drilling lightning into each hand. Before the venerable men, to whose exalted council one could even appeal against the verdicts of the Hellandodices if they had awarded victory, lay the bloody parts of a wild boar cut into pieces. It was at such a sacrifice that solemn oaths were taken. Now the champions, their fathers, brothers, and gymnasts, approached. Taking the pieces of the sacrificial animal in their hands, they had to swear that they would not be guilty of any offense against the Olympic competition—this meant, for example, that they would not commit bribery; they could be cut into pieces like that sacrificial animal if they did not keep their oath. The champions themselves also had to swear under oath that they had prepared for the competition for at least ten months. After them, they were also bound to an oath, which would determine whether the people who registered for the boys' race were not already too mature to participate, and also those who had to determine which horses were adult and which not. In this oath, they had to promise to proceed without deceit. Everything heralds the approaching race. The Hellandodike publish a program for it. Already, the "olive tree of beautiful wreaths," which, as we recall, stood not far from the southeastern main entrance to the Altis, is being cut, the branches which would be woven into wreaths for the victors. This was done with a gold knife by a boy whose parents were both still alive; anything that evoked the idea of imperfection, of something tainted, had to be removed from the race. The prepared wreaths—usually seventeen, for that is how many contests were usually announced on the program—were laid out on a table in the temple of Hera. But before the contest began, the great sacrifice of the Eleans had to take place, the principal religious ceremony of the festival, of which all that followed was originally only an appendage. Hundreds, indeed thousands, began to move toward the open square before the great altar; a bustling crowd jostled in the echoing gallery. Suddenly, however, it fell deathly silent. The sacrificers climbed onto the altar, and the herald's voice resounded through the room: "Beware of false sounds." Everyone remained silent, taking care not to disturb the sacred ceremony with any noise. How easily could some word or sound prove an evil omen! The offerer above utters a prayer that it may please the Father of Gods and men to accept the sacrifice graciously. Thousands mentally join in this request. The swirling column of smoke rising upwards soon reveals that the sacrifice has been lit. The soul rises to the Awe-inspiring One, from whose hands descend the blessings for which one prays here.

This place had gathered with this, the first day of the festival ended. By the

following night, people were already crowding the earthen rampart surrounding the stadium. Before sunrise, most spectators were already in their seats. The boys' competition was to be held on the following day. How many a mother would have loved to be there, to see her son in his greatest strength and glory, perhaps even to see him triumph. However, an unforgiving law closed the games to married women; young girls were apparently admitted, according to Spartan customs, though presumably no use was made of this permission. Legend told of a mother who, disguised as a gymnast, had followed her son into the stadium. The boy was victorious; at that moment, the deception was discovered, but she, however, because father, son, and brothers had been victors at Olympia, was spared. It was a law, namely, that women who crossed Alpheios during the competition, approaching the sacred area, were to be thrown down from a rock in the neighboring mountain—they were pointed out to each other. This law, however, was undoubtedly merely a matter of tradition, not born of any real need to counteract what was considered evil. Tradition added in the same breath that the mother, dressed as a gymnast, was the only one who had attempted to break that law. We need hardly tell you how much the Greek must have enjoyed the sight of those running, wrestling, and boxing boys, the Greek who had such a deep sense of the glory of the blossoming human being. The happiness of a father to see his son crowned was certainly not insignificant, and the victories of boys also increased the fame of a city. Yet, the men's competitions remained the main goal. Only these were said to be institutions of Heracles, which were later recalled; that boys also performed in the camp was entirely a human invention of the Eleans. The boys' competition was a miniature version of that of the men. The pleasure that the exercises as such offered the spectators was therefore greatest for the men.

It began on the third day. Once again, at the early dawn, the spectators were already in their seats. Probably not long after sunrise, there was movement on the side of the "secret entrance." The Hellanodices, in purple festive robes, appeared first; they stepped forward to take their separate seats, probably built into the earthen wall on the side of the hippodrome. Soon, the so-called alytes, led by their alytarch, lined up alongside them. These were a kind of police force, armed with sticks, assigned to the Hellanodikes to maintain order and observe the so-called Olympic laws, the fixed rules for every contest. Opposite the Hellanodikes, on the other wall of the stadium, sat the priestess of Demeter, Chamyne, on an altar of white marble, the only woman permitted to be present at the competition. Now the champions, along with their gymnasts, also appeared, men, primarily theoretically developed—they did not need to be great athletes—to whom the leadership of the gymnastic education of the rising generation had been entrusted. Very often, they had known the champion they were now accompanying from their earliest youth. It was they who had determined the type of competition for which the boy's physique made him most suitable, who had always so regularly regulated the exercises in the gymnasium, and taken such precautions—the boys' actual drill masters were the paidotribes—as each one's particular constitution and possibly a few minor defects seemed to necessitate, and who, through years of careful and loving observation, had come to fully understand the weaknesses and strengths of their pupils, including their moral ones. They were easily distinguishable. Here, unlike the custom at other festivals, they were completely naked—the Eleans recounted that the incident with their mother dressed as a gymnast had prompted them to order it—but as a sign of their dignity, they wore a stlengis, the instrument with which the champion was rubbed off the oil mixed with dust after the competition. How they are engrossed in conversation with the champions! Once again, they recall everything they had to think about, they encourage themselves, and they do so in a way that suits each person's character. What stories circulated about the delicate tact with which gymnasts had urged their competitors to great exertions! They were also the ones who had oiled their bodies, for this too was a task, that it had to be done with deliberation. Overall, they presented the exhilarating spectacle of a more advanced age, sympathetic to the expectations of a younger generation and able to identify with its glory.

The herald loudly announces the start of the competition: "The competition begins, which yields the finest prizes," according to the established formula, "There is no time to delay." Now the champions, who had been seen entering the stadium, step forward. They were participants in the so-called long run, because that was when the competitions began. Once again, the herald's voice rises. The name of the first competitor is called out, along with that of his father and his hometown. He then introduces himself to the assembled crowd. One can still, on the same grounds as a month ago among the Hellanodikes in Elis—if one is not a Helen or a freeman, if one has lost his citizenship rights in his state, or if one has committed an offense

73570 against the Gods—resist their admission to the competition, and the herald loudly invites everyone to do so. If no one rises, a second participant immediately follows, then a third, until finally all are present. A drawing is held. Four by four, they will make the first run; the victors from these four will compete for the prize. The first group of four advances. The gymnasts must remain behind a parapet. These runners were men with not very well-developed legs and strong necks and shoulders.

73575 The Hellanodikes give a signal. A barrier or rope is removed. The runners set off calmly. They hold their arms out in front of them, and to be able to maintain this position for a long time, that strong development of shoulders and neck is necessary. They move at a brisk pace; yet it's clear to them that speed isn't the point. They have to circle the two ends of the three posts, which ran lengthwise across the

73580 center of the stadium, several times—we don't know how many times—and therefore, above all, they must ensure they get into a momentum they can maintain for a long time, rather than slackening off again later, when it really matters, due to excessive speed at the beginning. What self-control was needed not to be swept along, as it were, by a competitor who is charging ahead a bit too quickly. Each time they

73585 approached a post, they often curbed their progress slightly, to be able to make the shortest turn around it. Suddenly, however, one of the runners changed their stance. The arms, which until now had been held straight out in front, now began to move along with the leg; the arm on each side moves forward and backward in tactical coordination with the leg on that side; The flat palms cleave the air. This movement,

73590 however, has nothing violent about it; the muscles are not particularly tense, the forward arm is often slightly bent. It is noticeable that the runner has suddenly accelerated; with wide strides he flies forward; his feet touch the ground only briefly; he holds his upper body upright, thus providing himself with more ample breathing. It is this swinging of the arms that imparts a unique momentum to the

73595 upper limbs and thus prevents them, through their inertia, from countering the movement of the legs. The finish line is already approaching. The runner knew his strength and knew that he could cover the remaining part of the race at greater speed. However, he does not remain alone for long in this altered movement; one of the competitors follows ahead, the other behind. Now the mutual relationship often

73600 changes; whoever was ahead comes behind, whoever was behind comes ahead. The tension of the spectators increases more and more; From all sides, a shout echoes through the stadium: they are being egged on, and the gymnasts, especially behind their parapets, are ready to call out to them, every time they pass by, the word they believe will most invigorate their courage. Their own cries also mingle with the general clamor.

73605 It's as if this gives them new strength. It's getting tough, though, and they threaten to succumb; but persevere, and renew their efforts, victory is not yet lost. There they circle the turning pole for the last time; the goal is already close in sight; the seat of the Hellanodikes is near. The battle is already decided; arms drop, steps shorten, the foot of the first has passed the goal!

73610 Now it's the turn of a second group of four, then a third, a fourth, until finally all participants have had a turn. How the tension among the spectators now mounts: the victors from the groups will fight for the final decision. Who will be the lucky one? Everyone has already seen all the participants run past them once, so you can guess.

73615 They are making moves, but there's not much to say about it; they are, after all, quite evenly matched. Each time during the fight, the relationship changes. For the spectators, it's as if they themselves have completed a difficult task when the last circuit is finally completed.

73620 Who is the victor? This hasn't always been clearly visible from the earthen rampart on which they are seated. Soon, however, all doubt disappears. The victor steps forward, the vanquished disappear through the secret entrance. They are in a sad mood. Their expectation when they return home is "no cheerful laughter from their mother." They seek "unfrequented roads"; the fear creeps over them that "on the

73625 streets" of their hometown they will "encounter the mocking gaze of an enemy." What bliss, on the other hand, flows through the other's breast. A Hellanodike approaches him to crown him. A palm branch is placed in his hand, a woolen band² tied around his head, and the olive wreath placed on top. Already, his gymnast approaches him, almost as happy as he himself; his relatives also seem to detach themselves from the circle

73630 of spectators; they are eager to congratulate him. "Who is he?" they ask from all sides. Many probably know him. Perhaps his name was already being passed around by word of mouth when he distinguished himself during the competition. Not infrequently, it was an old acquaintance, a previous victor either at Olympia or one of the other great games. Perhaps someone had remembered his name when it was called out at the

73635 beginning of the competition. But all uncertainty soon disappears; the herald shows him to the assembled crowd and announces in a loud voice his name, that of his father, and that of the city to whose citizens he belonged, or wished to be counted. Now everyone gives themselves over completely to the joy. He himself walks in a proud, stately posture along the earthen rampart of spectators, uttering cries of

73640 ecstasy. Gymnasts, friends, and relatives have reached him, but also strangers, as far as they were sitting near the front, leap from the heights as he passes, showering him with leaves, flowers, and wreaths. Those sitting further away throw them over the front rows, and many small gifts are mixed in among them, such as belts, hats, and the like. Joy reigns everywhere; people cheer with the cheering, and

73645 in the hearts of many young men, the resolve takes root to exert themselves with all their might to one day share in the same glory. After the victor has gathered as much as possible of what was thrown at him, he disappears from the arena. After this long run, it was the turn of the single track through the stadium. Once again, the champions are called into the arena. They are remarkably quick in their movements and slender of leg. Lots are drawn again, for here too, the race begins in groups of four. How the spectators' intense attention is compressed into a short space of time! The runners begin at the far end of the stadium, on the side furthest from the secret entrance; as soon as they reach the beginning, at the Hellanodike seats, the race is decided. Like a whirlwind, they rush forward, arms and legs moving

73655 simultaneously from the very beginning. It is now simply a battle of speed. After the groups have had their turn, the victors from the groups compete here as well. The victor is proclaimed and crowned. A similar scene takes place as after the first race.

Now the third type of race was in order, the so-called double run, once through the stadium and back around the turning post. This was like a combination of the first two types. The course was too long for one to triumph solely through speed; too short for one to triumph solely through perseverance. One should not adopt one's greatest speed, but the speed at which one knew one could endure until the last moment. Each type of race, therefore, had its own specific speed, and it was very difficult to transition successively from one speed to the other. The victory of Polites of

73660 Keramos, who triumphed in all three types of race in succession, was therefore quite extraordinary.

The victor in the double-battle is crowned. The sun is already high in the sky. The "light" contests have ended; the "heavy" ones—wrestling, boxing, and pankration—begin. It is the wrestlers who are called first into the arena by the herald. Lots must be drawn here as well. Even in the tough competitions, drawing lots was more important than in the race: it naturally made no difference who one would be paired with, and above all, the so-called 'ephedra' was a great advantage. The silver urn is brought out; in it were so many leads.

73675 Little tickets were placed when there were champions. These tickets had letters on them, each letter on two tickets; if the number of champions was an odd number, then there was one letter that appeared on only one ticket. Those who had drawn the same letter would be paired; however, the one who drew the ticket without a match would

73680 this time (the winners from these first pairs were paired again later) be able to "stay put" in the competition for the others; he had the "ephedry," he was the ephedros, "the man who sat there."

The wrestlers are already approaching the urn. The first one puts his hand in. He says a short prayer and withdraws his hand. How he burns with desire to see if he has drawn the letter without a match, but one of the alytes holds his arm and prevents him. There must be order in the matter; He is led by the alyte to a specific spot, where he must initially remain standing with his arm outstretched. Soon he is joined by a second, then a third, until everyone has cast their lots and stands in a circle next to each other. The Hellanodike or the alytarch reads the letters; one now knows

73690 who they will wrestle with, one knows who will be ephedros.

The pairs advance. They are powerful men with beautiful, well-rounded limbs, more broad than tall, yet anything but stocky; though the neck is not particularly long, the head is raised proudly. The shoulders are broad, the chest well-rounded, the belly somewhat heavy, though there is no question of actual corpulence. The wrestler strides towards them with an easy gait; yet one can clearly see from the sturdy legs that they remain steadfast where they were once placed. The spectators' interest is great, because beyond the tension that every match generates, an extraordinary artistic pleasure awaits them here. They were treated in advance to the sight of the various beautiful positions and postures that wrestlers, who understood their art

73700 well, could assume, or achieve spontaneously. They were familiar with the technical

terms used for this purpose in the gymnasiums and expected to see all movements executed with the utmost precision. Yet, deviations were to be feared here, and not only deviations from the strict rules of wrestling, but nowhere was more supervision required to ensure that the Olympic laws were upheld than precisely in this competition. Here, it was possible for one fighter to deliberately kill the other; something that was strictly forbidden. However, the attempt to do so was rare. It was more likely that, in the heat of the battle, one or another would be tempted to kick or punch, or even bite with their teeth. Then, however, he was quickly reminded by the stick of an alyte on his back that wrestling must remain a contest of pushing and wrestling. Three Hellanodikes, commissioned for this purpose, kept a regular eye on things.

But the fight has begun. "In wasp formation," as it was called, the wrestlers from the various pairs stand facing each other. That is, they step forward cautiously, somewhat pressed together, with their upper bodies more or less bent forward, their eyes fixed constantly on their opponent, their hands slightly extended to grab the opponent, but in such a way that they are also clearly prepared to withdraw in time if they are in danger of being grabbed themselves. The various wrestlers stand facing each other like this for a long time. They try to find a spot where they can grab each other effectively. However, if such a position presents itself, one still doesn't know whether the opponent isn't deliberately and seemingly exposing themselves, and in that case, by engaging, one would run a great risk of falling into their hands; in wrestling, cunning also played a very important role. Suddenly, however, a cry went up through all the ranks. One of the wrestlers had quickly bent to the ground, grabbed his opponent by the foot with one hand, and in the blink of an eye brought the arm he still had free under the opponent's leg, pushed the foot down, and thus, with his arm as a support, used that leg as a lever to lift his entire body. Barely had the other leg of the wrestler been lifted off the ground for a moment before his heavy torso bent backward and he himself collapsed into the sand. Soon, however, he stood up again, and the fight began anew. After all, unless one of the parties surrendered, one had to throw one's opponent to the ground three times to win. Continuing the fight on the ground, rolling over each other, was forbidden in a venue as prestigious as the stadium at Olympia.

And this wasn't the only way one could be suddenly overwhelmed by one's opponent. Sometimes, one wrestler would suddenly land in the other's back with a mighty leap. One of the legs in an instant is struck around the stomach, one arm around the neck. The victim threatens to suffocate and, in the anguish, declares that he gives up. Sometimes, a harsh scream suddenly resounds through the stadium. Two of the combatants hadn't noticeably changed their stance, but one had seized the other by the fingertips and broken them with a single, powerful squeeze. The unfortunate fighter is now forced to give up.

Usually, however, one rarely saw such sudden victories at Olympia. Here, the most outstanding fighters from all corners of the Hellenic world gathered, their strength and skill only slightly surpassing each other. After standing face to face for some time, they finally grasp each other by the wrists. Their heads are pressed together "like goats"; one tries to push the other back. They push off forcefully with their feet and push against each other. Then one of them steps back a little. The spectators stir; a decision seems imminent.

But suddenly, the repressed, a rousing word from a father or brother, or from the gymnast behind the parapet, rings in the ears of the one who has been pushed back. He pulls himself together, summons all his strength, and pushes his opponent back. Fortunately, for had he been forced further from his position, he would very easily have lost full control of his limbs and been easily overwhelmed. Now, it is as if a stream of renewed vitality tingles through his veins; the glorious image of victory floats before his eyes in all its splendor. He has thrust himself forward again, as if in a single jerk; indeed, it could happen that the newly gathered strength suddenly gives him the upper hand. His opponent staggers and suffers the fate he had intended for him; pushed further and further back, he is carried powerlessly through the stadium. But wrestling, as we said, was a battle of pushing and wrestling, and often the wrestler certainly didn't win by simply pushing. While pressing against each other in this way, they usually tried to push the hand holding their opponent's arm forward until they reached their neck, or else they tried to wedge the arm they were holding between their fingers, in order to grab them around the thigh or waist. Even now, one is absolutely not safe from a sudden attack; one must be prepared for the opponent to suddenly release the arm they were holding and unexpectedly grab them by the foot, leg, or neck. But even without such sudden turns, after a while one of

the two combatants often finds themselves at a decisive disadvantage. Now, the opponent's hand has reached the neck and is already grasped by a few fingers. With all his might, he pushes himself away from him, but the other pulls him toward him.

73770 His fingers advance; his arm wraps around his neck; he feels his opponent's weight pressing ever more heavily upon him. Courageously straining to remain standing! He tries to raise himself to his full height against the increasing pressure from above. Perhaps the other will expose himself at the last moment, and thus turn the tide. But

73775 gradually the oppressive force becomes too strong for him; his knees buckle; he feels himself sinking: ever faster he approaches the ground; finally, he is on his knees, his head, encircled by his opponent's arm, bent forward against the ground. Another time, one of the opponent's arms has forced its way up to his opponent's thigh. He seizes this opportunity, and the other might seize the opportunity of him bending slightly to throw his arm around his neck, but it's no use; he's lifted off

73780 his feet and has to fall. Or perhaps one of the combatants has already advanced his arm more or less around the other's waist. However much he exposes himself, the fight is still decided. Soon, that arm has advanced so far that it's possible, with a mighty jerk, to lift his opponent's entire body off the ground and send it tumbling backward into the sand.

73785 Yet, even for such solutions, many combatants were too much of a match for each other. The bodies approach each other, one grabs the other, and it's hard to say whether either has the advantage. What an effort of force now to force each other to the ground! The upper bodies, pressed tightly against each other, bend back and forth, forward and backward, or to the side; one tries to make the other feel the

73790 weight of his own weight in an unfavorable position, in order to make him fall more quickly. Not infrequently, one of the parties succeeds with his leg falling from the other to encircle others. This is lifted from the ground. It is impossible for someone thus dislodged from his perpendicular position to resist the weight of his opponent for long. He reaches the ground more quickly or slowly.

73795 These and other similar scenes held the attention of the spectators. Their eyes were drawn alternately from one group of wrestlers to the next. The movement they saw involuntarily stimulated them to move. They jumped or waved their arms or their clothes, jokingly made a wrestling gesture with their neighbor. Finally, all pairs had finished the fight. A new match began between the victors from those pairs and,

73800 if there was one, the ephedros. Lots were drawn again; again, if the number was odd, someone received the ephedros. This second match could have been followed by more. The fight continued until only two remained, battling for the prize. Ephedra, in particular, was a major advantage in this final fight. It was awarded to someone when, after repeated pairings, only three fighters remained. Two of these would first

73805 fight each other, then the victor of the two would fight the third, who would then become Ephedra. All the attention of the audience focused on the final fight. Finally, it was decided. Exhausted, yet momentarily oblivious to his weariness, the victor was crowned and made his journey through the stadium. The wrestling was followed by the boxing. They were entirely different men who now emerged from the secret stadium entrance. While they, too, were solidly built, the beauty of well-endowed and lustrous limbs was lacking. Rather, one saw the sharp lines of a more powerful muscular development, especially in the arms. Yet, even though their legs don't give the most impression of strength, they stride forward with firm, determined steps. Their upper bodies rest powerfully on their robust hips.

73815 Looking at their hands, one can easily believe the stories about some of them, that they could smash stones to pieces with their fists and crush metal objects. The scars, especially on their faces, and no less so the pankratiast ear, completely deformed by that constant wounding and then healing, tell the tale of so many past battles. It is a drama that will soon be witnessed, awe-inspiring in the gravity of its reality.

73820 The names are called. Lots are drawn; here too, if the numbers were odd, an ephedros. Now, each boxer's hands are wrapped in straps—no longer the soft, soft leather ones used, for example, during Elis's preliminary exercises, but with hard, sharp ones that not only protect the hand but also transform it into a formidable weapon. These

73825 straps usually pass between the fingers, fill the palms, and are fastened around the wrists. The pairs proceed to their designated positions. Immediately, a kind of preliminary combat begins, where, just like two opposing armies, each tries to gain the advantage over their opponent, having the sun at their back. Soon, however, they have taken up positions opposite each other. Burning with fighting spirit, they thrust and wave their arms in the air. This was the so-called "shadow fight," a prelude to the actual fight. Suddenly, however, things get serious: the fighters charge at each other,

73830

their left arm raised in front of their head to parry a blow, the right back to deliver one. The onlookers are filled with dismay at the approaching clash.

73835 Soon the blows begin to ring out. The more or less forward-leaning body rests primarily on the forward leg, while the feet, resting almost exclusively on the toes, spring upward each time a blow lands. They thrust further and further, aiming for ever greater impact. Now the blow lands on the head, jaw, or shoulder, then again on the opponent's defensive arm. Not infrequently, the fist even crashes through the air

73840 without striking anything. Indeed, it happened that a sudden dull thud was heard, and one of the fighters, dragged along by his own, unresisting arm, fell to the ground; the swift dodging of blows was the other major factor in this combat. Both fighters kept their eyes constantly on each other's movements. Their necks were held slightly back to allow for timely withdrawal. They were careful not to expose themselves and

73845 lurked where they could best attack the enemy. How careful, however, had they to be in this; any carelessness could only be apparent, and then they would have to find that the enemy was best prepared for that attack. But despite all precautions, many a battle could not be avoided.

73850 One is dizzy, yet one must be careful not to receive an even more violent blow at that very moment. One shrinks away from the pain, yet must swallow it down, because every painful expression on the face can only increase the opponent's courage. Wasn't that why Eurydamas of Cyrene swallowed the teeth that were knocked out of his mouth, and thus achieved victory? The fight grows increasingly fierce. One hears nothing but

73855 the impact of the blows and the deep breaths that accompany the arm's return to each blow. Sweat pours from the fighters' limbs. Rage seizes them, but they must control themselves, for very soon they would be harshly reminded by the Hellanodics that, according to Olympic law, striking out and dodging is not permitted. Therefore, they must keep their feet to themselves; grappling is part of wrestling. Another mighty

73860 blow! The head retreats between the shoulders; the arm is brought back even further, if possible, than before. It is decided: one of the combatants calls out that he surrenders, or raises one hand as a sign to indicate this. Sometimes the fight has lasted a very long time, without either party still considering surrendering. Yet both are very tired, and as if by mutual consent, they

73865 withdraw for a moment's respite. The fight then resumes. Occasionally, however, it might last too long, but then the Hellanodiki intervened and decreed that from then on, dodging would be forbidden. Everyone had to take all the blows. This, of course, brought about a quicker decision.

73870 It was far from the case that the two combatants always rushed at each other violently from the start. Sometimes one of the two would initially focus more on dodging and parrying than on delivering blows, and only after his opponent had exhausted himself from his unsuccessful efforts would he advance forcefully, making him cower under his blows. Naturally, they were only exceptional fighters who could engage in such combat against well-trained opponents. However, in the stadium, one

73875 occasionally saw even stronger pieces. While one fighter suddenly launched into the attack, the other calmly continued with "shadow fighting." Now, everyone present knew that among the boxers who had appeared was an expert in "arm-waving." Everyone knew stories like, for example, that of Melankomas from Caria, who for two consecutive days, by simply waving both arms back and forth in front of him, managed to fend off

73880 all his opponents; he had won numerous victories, yet he showed no scars anywhere. The attacker tries to reach his opponent's head through his arms, or by striking them to the side. If he succeeds several times, the arm-wielder is forced to resort to his usual fighting style. Naturally, in that case, he cuts a rather poor figure. Often, however, he can hold out. His opponent strikes ever deeper and deeper; this powerful

73885 blow, at least, he believes, will be effective. Again, however, the swinging arm collides with the descending fist from the side. The latter falls without having accomplished anything. Rage grips the thus disappointed man. The thought of being defeated by someone who doesn't even consider it worth the effort to strike him back is unbearable. He strains again; strikes again. But the other man swings steadily and

73890 is only rarely hit. Finally, the attacker is completely exhausted from all this effort. He has to raise his hand. The cheers of the bystanders are appalling. Deeply dejected, the defeated fighter slinks away from the arena.

In boxing, too, the contest naturally has to be repeated several times; here too, lots are drawn; here too, an ephedra is used with an odd number of participants. The

73895 final combat has taken place; the victorious boxer leaves the stadium. It is now late afternoon; the time for the so-called "battle with all means," the pankration, has arrived. Just as the double barrel was a kind of connection between the long barrel and the stadium, so in this last of the toughest contests, both the pushing and

wrenching of wrestling and the thrusting of fistfighting were permitted. Indeed, kicking with the foot was even permitted here, and what was not permitted to wrestlers at Olympia—namely, to continue the fight, which they had begun standing, rolling on the ground—could not be forbidden to the pankratiast if they wanted to let him remain who he was.

They were formidable men who now performed. Overall much like boxers, yet the greater roundness of the limbs, which is the consequence of wrestling was clearly visible here as well. It wasn't uncommon for boxers to be both boxers and pankratiasts; the deformed ear, common to both, was named after the latter. It goes without saying that the drawing of lots and the repetition of the fight proceeded exactly as in the first two heavy matches. Straps around the fists were out of the question here; the grappling grips of wrestling would have been impossible. The blows, however, inflicted fewer wounds. Yet this pankration, this squeezing, pushing, wringing, kicking, and thrusting, gave the impression of a life-and-death struggle far more than any other contest.

The fighters stood facing each other, their hands ready for the strike, their fingers tightly closed and only slightly bent. With astonishing speed, they transitioned from one fighting style to the other. The fist has barely landed with irresistible force against the opponent's jaw when, as if in the same instant, it opens and twists his arm, tightens his throat, or he falls backward, lifted by the leg. Two combatants are already firmly clasped, but with terrifying force, one tears himself free and retreats, only to charge at his opponent, as if in the same instant, and, still stunned by the sudden slippage, send him crashing to the ground with a tremendous thud. As they rolled across the ground, one would emerge, then the other: the intertwined bodies each time presented different shapes. Meanwhile, limbs were twisted, stretched, compressed; breath gasped at that powerful pressing against each other. At last, it was decided; One of the fighters shouts that he's giving up, or, as in boxing, raises his hand as a sign.

Here too, several matches follow one another; here too, at last two remaining fighters, or a fighter and an ephedros. Night is already falling; occasionally, the final pankratiast fight is illuminated by the light of the full moon. It even happened that the fight had to be stopped before anyone had won; the fight, which had already begun at sunrise, could no longer be allowed to continue. But usually, it is still daytime when the victorious pankratiast walks around the stadium. Occasionally, it could be quite early. It did happen, however, that at one of the matches, only a single fighter showed up, or that a fighter made such an impression on his opponents that they didn't dare take him on. In both cases, one champion triumphed without being dusted off, as the saying goes, i.e., without a fight, receiving the crown. How dryly it ended when the first incident occurred! What tremendous enthusiasm, on the other hand, he stirred up among all present, who, by his mere appearance, had already made his opponents recoil.

But after the final crowning, people longed for rest, and although the knapsack had undoubtedly been used many times during the day, after the intense interest of more than half a day, they felt a great need for a good meal. The crowd streams away from the stadium walls. They camp in the area around the Altis, in their tents or in front of them. The moon pours its "friendly light"² over the entire plain. People eat and drink. Cheerful banter resounds through the air.

Some time later, however, the Altis itself becomes busier. A joyful cheer and commotion resounded from there to the ears of the revelers camped outside. Many rushed there; they knew what was happening: the victors had also eaten and drunk with their friends, and then proceeded with them in a merry procession to the great altar. The great sacrifice to the giver of victory would only be offered on the last day of the festival. But just as among the Greeks, merry banqueters often rose from their table late in the evening to pay a cheerful visit to an absent friend and, as it were, involve them in the festivities, so now they felt compelled to proceed, also in procession, to the altar of the deity and, if they had the means, to offer her a voluntary sacrifice. With holy reverence in his soul, yet with jubilant joy, the human child stood here as if before the throne of the awesome One, showing him, like a father, the glory he had acquired, and sharing his joy.

The smoke rises and clouds the bright moonlight; it smolders on the altar of Zeus and perhaps on others as well. A confused clamor and hum still lingers, but it seems to be subsiding somewhat; even someone standing far away clearly discerns the notes of the phorminx (a kind of harp) through it, and suddenly a song of heroic voices of men filled the entire Altis. It was the triumphal song and the reverent greeting of Zeus that was being sung there. A poet had been present among the spectators and had quickly composed the short song. Before the great altar stood the singers with their

73965 chorus; the phorminx tuned each line; as if from one voice, the polyphonic recitative sounded; it was the still-fresh, overwhelming feeling of joy and reverent gratitude to "the most exalted Zeus, who propels the mighty thunder" that overflowed the song. It was far from the case, however, that every victor could bear the cost of such a

73970 tribute. Yet, before the great altar, they appeared, and even if they didn't have their own solemn triumphal song, they had to sing it. Indeed, they were least of all in the mood to be depressed by the sense of their poverty, and what others performed solemnly, they could also do improvisedly. As if they were professional singers, the victor and his friends stood in chorus at the altar. They did not have a flute,

73975 zither, or phorminx player at their disposal, but one of them compensated for this by calling out "tenella" (we would say "tsingala") before the beginning of each line, imitating the sound of one of these instruments, and thus half-jokingly setting the tone for each line. It was an old folk melody, in which Heracles was invoked as the model of all victors, that was thus performed. And if they had not possessed the talent of Simonides or Pindar, they consoled themselves with the thought that this

73980 song—and they were firmly convinced of this—had been composed by the ancient Archilochus. The merry commotion continued late into the night. However, barely had anyone rested for a few hours when the sun, with its first rays, called for renewed festivities. Instead of heading to the stadium, they took their seats on the artificial or natural elevations surrounding the Hippodrome, the horse racing track,

73985 south of the stadium, which was naturally much larger. In the center of the Hippodrome, two columns were visible, around which the riders had to ride: one close to the starting point—consisting of a statue of Hippodamia, holding the band she would later tie around Pelops' head, as it were, as a crown—the other not far from the semicircular end of the track. The building in front of the exit, the aphasis,

73990 was also particularly striking. It jutted out like the prow of a ship in the hippodrome, not quite straight, because, since the northern side of the racecourse was somewhat shorter than the southern, the triangle of the aphasis, whose base connected to the ends of these two unequal sides of the racecourse, was oriented slightly more southward. On both sides of this aphasis were several covered rooms,

73995 yet open to the front, where a quadriga could stand. If one rode forward in a straight line from the furthest room on the north side—that is, on the left side of the racecourse, if one stood with one's back to the aphasis—then, due to this skewed position, one would still end up passing the statue of Hippodamia on the southern or right side of the racecourse. All chariots had to move through the racecourse from

74000 left to right, and now, the chariots would only have been able to be positioned on the right side of the course if care had not been taken to ensure that, due to this slanted position, those positioned on the left could automatically reach the right side. Inside, the aphasis was largely uncovered; several altars were located there, among other things. One probably couldn't penetrate it from the hippodrome side, but

74005 the base of the aphasis triangle was bordered by a gallery, called, according to its creator, the Gallery of Agnaptos, and through it, thus at the rear, one could enter. Also noteworthy was the elevation in the form of an altar, which could be seen near the entrance to the Hippodrome, which ran through the southern earthen rampart. This was called Taraxippos, "horse-scare." According to popular belief, as they passed the

74010 altar, a sudden fright seized the passing horses, and various explanations were given, including that this was due to the evil spirit of Oenomaos, who still haunted the place.

It was a magnificent procession that could now be seen entering the Hippodrome through the entrance. Wealthy people from all parts of Greece, including women, had

74015 sent their finest horses and most skilled charioteers for the race. It began with a four-horse chariot race, four horses abreast. The various rooms in the aphasis were drawn by lot. Everyone then went to the room assigned to them. The charioteers jumped on the back of the horse.

74020 Two-wheeled chariots, on which they, or even they alone, can stand; the moment for the race has arrived. With rapt attention, one now looks at the copper dolphin, which stood on a crossbeam above the very tip of the aphasis. Suddenly, it falls off, and from the center of the aphasis rises an eagle, also of copper, with outstretched wings. This eagle had lain there on an altar, and one of the Hellanodices had set a

74025 device in motion, which caused the dolphin to descend and the eagle to rise. The signal for the race to begin had been given. Apparently, by the same device, once set in motion, the ropes for the two rooms on either side, which were closest to the rear of the aphasis, come loose. The two chariots standing there break free. A moment later, just as the horses from the first two rooms have reached the level of the two

74030 following rooms, the ropes for them also come loose; The four-carriage carriages

reached the level of the third two rooms, then the ropes in front of them, and so on. Probably, all the carriages initially had to move forward in a straight line, so that even those placed on the left, as we already indicated, increasingly ended up on the right side of the racetrack due to the skewed position of the aphesis. After the ropes for the two rooms were released at the tip of the aphesis, all the carriages were allowed to take whichever direction they wished, provided they only turned from right to left around the two designated posts. The closer one passed a post, the shorter the route, of course, and the two carriages that emerged from the rooms at the extreme tip of the aphesis had an advantage over the others the first time they departed, as their route to the turning post was somewhat shorter. However, this arrangement of departing gave the others the advantage that by the moment the rope for the two extremes departed, they had already reached a certain speed. All the advantages had been weighed against each other as accurately as possible. Cleoitas was the original inventor of this aphesis; a statue of him stood in Athens, the inscription of which mentioned this.

Now the cries of charioteers and the rattling sound of chariots resound through the air. Clouds of dust rise; the goad repeatedly descends on the horses' backs. All order soon comes to an end. Most chariots—now and then one might lag behind—soon form a single, intertwining swarm, swirling around the two turning posts. Here, two chariots are riding side by side. Now the heads of the horses of one are in front, now those of the other. Elsewhere, one chariot suddenly swerves to the side; one powerful summons to the horses, one powerful blow of the goad, and it has suddenly overtaken or outpaced the competitor who was riding ahead. However, anyone who is now on the move may soon find out for themselves. As one approaches a turning post, the right bridle is more or less released and the left retracted, the closer one gets to the post. This is a particularly difficult moment for those who have the advantage of occupying the position closest to the turning post; they constantly fix their eyes on both the post and the cart, and then calculate the turn they will make. Then the end of the axle scrapes against the post; the turn could not be shorter. Involuntarily, however, one has lost some momentum.

Suddenly, a clear trumpet blast sounds; the horses prick their ears; as if in one jerk, the old momentum is resumed. Sweat pours from the animals' bodies; The foam flakes splash backward on either side. Proudly the driver stands upright in his chariot, tense yet self-controlled, bold yet cautious. Sometimes, however, caution is of no use. One chariot snags against the other; with a tremendous crash, both crash to the ground; the trailing chariots fall over the already fallen ones; it is a tangle of broken chariots; unattended horses gallop through the racecourse. However, a few of the trailing chariots manage to swerve in time and rush past the fallen chariots, chasing the leading one. Another time, the chariots veer around one of the turning posts; the one who has secured the position closest to the post, as always, makes the turn as short as possible. Alas, this time a little too short; the axle hits the post; the chariot plummets to the ground.

The others continue the ride; the racecourse has already been covered several times. Now it's already becoming clear who will be the victor. Perhaps someone who had initially lagged behind has simply saved his strength, and now rides past the others at full speed. Finally, for the twelfth time around the racecourse; they approach the seat of the Hellanodics in the northern rampart, near the aphesis; they have arrived there; the battle is over. After a while, the Hellanodics' decision is announced. The victor is crowned. Second, third, and even fourth prizes were also awarded here. It didn't stop there; they also sought variety in the horseracing. Pairs of horses, four-horse chariots, and two-horse chariots of colts were also used here, but only eight times around the racecourse with them. For a time, teams of mules were also introduced. Horseracing was also very popular; this too was done with both colts and adult horses. Saddles and stirrups were not used. Besides adult men, boys also rode. They were completely naked. It was a delight to be able to observe the blossoming youth in every manifestation of their natural strength, to see them master the mighty steed with the full awareness of their spiritual superiority. One involuntarily thinks of the frieze of the Parthenon. For some time, a certain combination of horse racing and horse racing was also in vogue at Olympia, consisting of the rider leaping from his horse at the last turn and, holding the reins, running alongside it. At the very moment when the decision was approaching, victory was thus made dependent on the speed of his own feet.

It has become afternoon with all these races. Now that they have concluded, the crowd hastens back to the ramparts surrounding the stadium. The pentathlon, the pentathlon, is about to begin, the greatest masterpiece of Hellenic gymnastics, which,

originating on the soil of Olympia, had spread throughout the Hellenic world. Five exercises were combined into one whole: the jump and the race, in which the leg strength was tested in various ways; the discus throw, which tested the arm's strength; the javelin throw, which also, it seems, demonstrated the accuracy of the eye; and finally, wrestling, which placed other demands on the body. Understandably, the pentathlete was usually no match for a specialty in any of these exercises, yet his body was more versatile than that of any of the others. This was what made him the most beautiful of all champions. In the others, it was always a few body parts that particularly caught the eye; the pentathlete displayed strength and agility more in his overall appearance.

It was relatively rare for someone to win in three of the five exercises; very often, they won with two; indeed, it could happen that by the time the final contest, the wrestling, had taken place, there were five victors, each with one victory. These five were then likely allowed to continue wrestling until only one victor remained; similarly, a wrestling match would have been decided if, after the five exercises, there were two participants, each with two victories.

A good wrestler, therefore, had some merit as a pentathlete: yet, someone trained only in wrestling could not compete in the pentathletes, because most likely, those who did not meet certain minimum requirements in any of the five contests were not admitted to the next. The preliminary exercises at Elis would also have made the performance of such mock pentathletes at Olympia impossible. It is plausible that, as soon as the chance of victory had passed for some competitors, they dropped out. For example, if one person had won two victories, and two others one each, those who had not yet achieved a single victory would not participate in the fifth contest, since they could never equal the two-victory winner. If, before reaching the fifth competition, one of the competitors had already achieved three victories, they did not continue. Yet, this was undoubtedly a very rare occurrence. The wrestling, we know for sure, came last; the vault most likely first. This was presumably followed by the discus throw, then the race, and then the javelin throw. The most skilled competitor was often also a good vaulter; the good discus thrower could easily handle the javelin well as well. Had the vault been immediately followed by the race, those competitors who were more skilled in these two related species would have had a good chance of achieving two victories right from the start.

The pentathletes, completely naked, gather for the vault behind a pedestal, which, like our springboards, presumably had some spring. At a considerable distance ahead of them is the hard stadium's floor was loosened with pickaxes over a fairly wide area: the outermost edge of the loosened floor would have been approximately 50 feet from the pedestal for the jump. Jumps that did not exceed the innermost edge-how far from the pedestal it was, we do not know-probably caused the jumper to be immediately eliminated from the competition. Officials, equipped with a measuring rod, had to measure the jumps. Three Hellanodikas were charged with directing this competition. A rousing flute music begins, led by flutists in long, glittering robes, richly embroidered and fringed with wide hems. The pentathletes take their jumping implements, called halters, in their hands. The younger, more common model was entirely similar to our gymnastic implements of the same name: two balls connected by a crossbar as a handle; Sometimes one of these balls was replaced by a heavier weight of a different shape, which then held the pentathlouse most of the way.

Now the first to jump approaches, holding the hands with the dumbbells out in front of them. As they approach, they move forward to the music. They jump onto the pedestal; at the same moment, their arms descend; one powerful thrust with the feet diagonally upward; at the same time, the arms, weighed down by the dumbbells, are flung forward again with a mighty swing. Then, in an extended position, the body flies, as it were, after the arms. Will the jumper fall forward like this? No, as soon as they begin to approach the ground, they swing their arms back again with a mighty jerk, bringing their body back into a perpendicular position, and they land completely upright with their feet on the ground. This, at least, is how it should be, and the Hellanodics approach to examine the impression made by the soles of the feet in the loosened ground to determine whether it is truly perfectly even. Only when this is the case does the jump count and measure itself. After the foot impression is obscured with the pickaxe, the second jumper follows, followed by the third; finally, the competition is over, and the victor is known. The spectators followed every jump with rapt attention. Occasionally, they were treated to an astonishing spectacle: a jumper landed on the hard ground above the loosened ground.

The furthest known jumps are 52 and 55 feet.

The three metal discus, or throwing discus, used in the pentathlon at Olympia are brought out. Such discus were quite heavy and, when held in the hand, reached

approximately to the bend of the elbow. The vaulters have now become discus throwers, and the first to go steps forward. He takes a discus and, holding it against his body with his left hand, walks to the small platform from which he will make the throw. He steps onto it, grasps the discus with his right hand as well, with which he will throw it, and extends both arms straight out in front of him. He now rests entirely on his right leg, so that the left can move freely back and forth. The discus is pressed firmly against the palm of the right hand with the fingers; the left hand is removed. There, the arm with the discus swings back a distance, much further than our bowlers do. The eye must not leave the discus to give the throw the desired direction. Therefore, the upper body bends forward; Along the right side, under the arm, the discus thrower looks up at the discus. With his left hand, he rests on his slightly bent right knee, and his left leg naturally moves slightly backward. The body leans more forward, and the right arm with the discus is higher off the ground than would otherwise be possible, since the platform on which the discus thrower stands—at least, that's how one seems to imagine it—is slightly slanted at the front. All this lasts only a moment. The fighter straightens up; the discus hums straight ahead in arcs through the air. It was a tremendous shock; his free left leg has, as it were, followed the movement; indeed, he is forced to take a single step toward the discus. He watches it tensely in its humming speed. Then it hits the ground with an audible thud. Usually, it landed at a distance of about 90 feet, more or less. A second thrower took up the position. Presumably, the first-thrown disc remained where it was, and he had to throw his own over it, or he would have lost the battle. Then, of the two discs, the one that had been thrown the furthest was probably removed and brought back to the throwers' side. Apparently, three discs were in use, because the third thrower then...

There was no need to wait for the discus, which was being returned, to arrive. Undoubtedly, a minimum requirement had to be met here as well if one wanted to avoid being eliminated from the entire competition. After throwing the discus, the competitors begin the race. First, they run four by four, followed by the victors from those groups of four. It was likely a double run that was being witnessed, a spectacle they had already enjoyed the previous day. By comparison, one might have noticed that this time they were not dealing with specialties. The fourth part of this competition saw another novelty. The competitors now appeared with extremely thin and light javelins, equipped with a very long, fine needle-shaped tip. They took turns. They grasped the javelin in their right hand approximately in the middle; In all likelihood, one grips a handle with one's thumb, little finger, and ring finger, while the other two fingers are extended back and the javelin is held between them. This is brought to head height, with the target firmly in view; one thrust with the arm, one step forward with the right leg, and the javelin flies forward and soon lodges in or next to the target. A keen and practiced eye was required to avoid missing, but the light javelin also had to be propelled forward with great force, as otherwise it could easily veer off course. After the wrestling, the pentathlon ended. As a bonus to what had been seen, and as a conclusion to the series of actual competitions, the so-called "loop in de wapenen" (run in arms) is still held today, i.e., a run, presumably once up and down the stadium, with a shield on the left arm. In ancient times, one also wore a helmet on the head and leggings. This, however, was later abolished. It is clear that this race again required separate practice.

Now the herald announces the end of the competition: "The race, which yields the most beautiful prizes, is finished; remove the oil"—without which, as is well known, there is no competition—"The trumpet calls for the works of Enualios (the god of war)." Indeed, the sound of trumpets seems to have been heard at this point. It is not unlikely that the so-called contest of heralds and trumpeters, which we read about in Pausanias and others, took place, and which could hardly have been part of the actual competitions.

In the evening, people return to the Altar of Zeus. Now, there is an even greater chance of hearing songs composed there for this very occasion than the previous evening, because the wealthy people who have triumphed in the races can easily afford them. The following day, the last of the festival, the Eleans offer a great thanksgiving sacrifice at the altar of Zeus; afterward follows that of the victors, and finally, a splendid procession of theores proceeds through the great southeastern entrance to the Altis, also to the great altar, to thank the god with offerings as representatives of "happy Greece." The conclusion of the entire festival is the meal in the Prytaneion, given by the Eleans to the victors. These now depart for home, certain to be hailed as victorious generals. In the Altis, their statue will rise,

- 74230 none greater than themselves—the Hellanodics would not tolerate such a thing—one of human proportions, not that of the demigods; a poet will now compose a more elaborate song of triumph, not so much to glorify their persons as to make them feel more deeply the value of their happiness and to serve as a monument to it for themselves and their distant descendants.
- 74235 Thus the Greek found an inner satisfaction at Olympia, something certainly not often experienced by our race; but he found it only, as we have already noted, by immediately silencing every inclination toward something higher than seemed attainable. Now, however, the human spirit cannot ultimately be confined within "the pillars of Heracles,"³ and Greek philosophy broke through the circle, although at
- 74240 first it was completely unaware that in doing so it was, as it were, tearing away the very foundation of the Greek people's spiritual existence. It is especially in the period following the demise of Hellenic freedom that it poses this question with increasing emphasis—such an infallible sign that an entire worldview threatens to become obsolete:—what is the highest good for humanity? That question would certainly
- 74245 have sounded foolish to the heroes of Marathon and Salamis, to the Athenian citizen in the time of Pericles, who felt that he too contributed to the greatness of his fatherland, not least in Greece's best days, to the fortunate victor at Olympia. But now things had changed.
- 74250 The spirits strove for higher goods; for example, what was all that former glory for the Stoic compared to what seemed to him the only necessary thing: virtue? At the same time, it also became increasingly clear that the peaceful mission of Olympia, Delphi, and similar places had failed. Hatred and discord, which rage in the human heart like a force of nature, continued to fester in the Hellenic world, and to
- 74255 exorcise them, higher forces than an Olympian peace or a Dorian Eunomia proved necessary. The new temple of Zeus at Olympia was probably not yet fully completed when the Peloponnesian War broke out, and less than 30 years after Pericles' death, the orator Lysias had to remind the Hellenes, in the sacred precinct itself, that Heracles had established peace and freedom and instituted the Olympic Games, but now,
- 74260 solely as a result of internal discord, some of the Hellenes had fallen under the Persians, others under tyrants. Several times during the course of the civil wars, the Altis itself became the scene of self-destructive fratricidal warfare. No "sacred month" was observed in these events; the sanctuary had forever lost the significance it had held for the life of the Hellenic people.
- 74265 For centuries, the Hellenic world labored toward a flourishing period that would last only a few decades. Fortunately, however, the afterglow for our generation was almost as fruitful as the flourishing itself; Consider, for example, Alexandrian scholarship and Pergamum sculpture. Greek life had certainly risen from the cothurn, the stage
- 74270 shoe that had made humans appear demigods, but nevertheless, what the power of a higher inspiration had created responded so completely here to all sorts of truly human inclinations and needs that it could still hold its own quite well on the level ground. So, while people no longer competed in their feelings in the stadium and hippodrom for the highest human goods, the healthy person naturally feels excited to exert their physical strength, and competition dominates us to a greater or lesser
- 74275 extent in all our actions. Thus, it was now only the mysterious power of tradition that made Olympia anything more than Derby or Longchamps today. It's impossible to say how long a state of civilization without a soul, so to speak, can survive, but it's beyond doubt that it can't possibly preserve its finest character traits. It's an old observation, already made by Cornelius Nepos, that lavishness in honors is a
- 74280 sign of decline, and it certainly was so to a high degree among the Greeks, who once, above all, had sought to be measured, serious, and truthful in this respect. However, now—numerous recently discovered inscriptions prove it—people at Olympia, too, very readily concluded that someone had, in some way or another,—not exclusively as a champion—deservedly merited a statue. The Roman Claudius Rufus, a pankratiast, had
- 74285 made himself very agreeable during his stay in Elis in preparation for the contest; Now, according to a discovered inscription,³ he is named an honorary citizen of Elis and allowed to have a statue erected for him, because he had nearly won the contest; night had intervened, rendering the fight indecisive. Furthermore, it was deeply significant that people at Olympia no longer felt as exclusively Hellenic as before.
- 74290 How could that have been possible, at least in the time of the Romans, whose empire encompassed numerous peoples and placed them on almost equal footing? True, people then also strove for the unification of all Hellenes, a Panhellenic union, as it was called, and Panhellenic congresses and festivals were held, but one might call this a vain romantic endeavor if it had not entirely lacked the sincerity, sincerity, and

74295 warmth of modern Romanticism. The Roman emperor was the foremost patron saint of this
Hellenic patriotism! At Olympia, champions from almost the entire Roman Empire now
appear. In common parlance, according to the inscriptions, the term "the inhabited
world" replaced the earlier Hellenism—an expression that also became very popular
74300 elsewhere in Greece. It was this inhabited world that would soon become the field of
activity of the Catholic Church.
The power of the old idealism weakened and left the Greek more exclusively to his
baser inclinations and desires. He, especially the Jonier, had always possessed a
strong sense of outward splendor, and the fresh zest for life that had given him such
deep pleasure in cheerful festivities led him down a slippery path.

74305 From there, he could easily descend into that unenriched sensual pleasure he had
originally considered beneath his dignity as a Greek. This was the weak side that
could most easily lead him to betray himself, and the tyrants who sought to rob the
Greek of his most precious possession, freedom, knew full well that he had to be
74310 seized there. Dionysius, the tyrant of Syracuse, sent an embassy of theoreticians to
Olympia at the end of the 5th century, which was to dazzle the eyes with the
extraordinary splendor of his armor. It was on that occasion that Lysias delivered
his aforementioned speech, and even then the assembled Greeks, stirred by his words,
tore down the tyrant's magnificent tents: Away from me, Satan! Sixty years later,
74315 however, Philip of Macedonia appeared on the sacred ground. He had a temple built for
himself there, as if he were a Hellenic hero, like Pelops or Heracles, and
"scattering many and varied benefits and gifts, he reaped a very abundant reward of
gratitude."
Things did not improve in Roman times. Many of those in whose honor statues were
74320 erected, according to the inscriptions, were prominent ladies and gentlemen from
Rome. The shame of slavery was deeply felt when Emperor Nero conceived the plan to
earn a crown at Olympia as well; - he acquired everything there, 1808. The
celebration had to be postponed for three years because the emperor couldn't come
sooner—that celebration, by which the calendar was established—and then he was not
74325 only crowned as victor in the horse races—he fell, according to the story, while
driving off the chariot—but also in a musical competition, which had to be organized
for his sake, although the ancient tradition of the sanctuary didn't permit it. The
reward was a colossal sum of money. Now, one shouldn't think that the evil was
exclusively monarchical; it manifested itself equally in republican guise. Truly
74330 republican was certainly that "ambition" of the Hellenic citizen in Greece's heyday
to render service to the fatherland and fellow citizens. What a rivalry existed, for
example, among the wealthy citizens of Athens, to provide, partly from their own
resources, for the equipment of a fleet or even for a splendid performance of
choruses! The only reward one could hope for was the gratitude of one's fellow
74335 citizens, at most monumentally expressed in a metal tripod. It was also in this
manner that, in later times, one received the "benefits" most appreciated at the
time. Thus, for example, we read of a Theban citizen from the Roman imperial period,
Epamimondas, who, among other things, during a great festival in his hometown,
"treated all the revelers, including those from other cities, to the theater," and
74340 "prepared large and expensive dishes, so that the expense he incurred caused a fame
in the surrounding cities." It goes without saying that a citizen who had thus
enhanced the fame of his fatherland had to be rewarded. The above description of his
merits is therefore taken from an official document in which he is awarded several
statues and a wreath. It is now undoubtedly often the same kind of "civic virtue" and
74345 "philanthropy" for which so many are praised in the inscriptions now found at
Olympia.
Finally, a new life principle was infused into this human world when Christianity
came to power, but how completely different from the ancient Hellenic religion! The
Christian strove for a glory that was not of this world, and the training
74350 (asceticism) of the athlete for a competition was replaced by that of the monk to
heavenly perfection. The human being who wished to rise above his lower nature no
longer considered that goal attainable through glorification of his earthly
existence, but clung to the deep sense of a higher world order that he carried within
himself, in order to strive to be more than human. With an infinitely deeper sense of
74355 humiliation than the Greek at Olympia or elsewhere had ever known, bowed down by the
guilt of an entire human race, the Christian approached the throne of an almighty
God. It was not Nike who could lift this burden from his soul, but only the divine
Redeemer himself, who had suffered as a human being on earth. How could the
racecourse, when such a spirit breathed new life into the world, seem anything but a
74360 vanity of vanities, serving only to bind the soul, aspiring to heaven, to the dust?

In the fourth century, Christianity triumphed in the Roman Empire; in 394, the Olympic Games were banned forever. The name of an Armenian has been handed down to us as the last victor.

The buildings and statues of the ancient sanctuary have stood for a very long time; a violent earthquake almost completely destroyed it, and a landslide from Kronos Hill covered some of the buildings at its foot. Quite different scenes now behold the sacred precinct. On the foundations of what is called Pheidias's workshop, a Byzantine Christian church arose, largely constructed from ancient building materials. The Olympia area was also very unsafe due to all sorts of wild hordes.

Therefore, the large square fortification wall, already mentioned, was built between the Temple of Zeus and the southern gallery. The fragments of ancient architecture and sculpture were the primary material. From this wall, as we recall, Dr. Tren, among others, retrieved the pieces of the Megarian treasury. Perhaps one of these hordes ultimately triumphed. At least, later on, a rather uncivilized population

settled in the sacred area, living in miserable huts, cobbled together from the same materials, which were available here in such great abundance; statue pedestals, architectural ornaments, and pieces of sculpture were piled on top of each other, usually without any means of connection. The German scholars working at Olympia, with more or less justification, usually call these people Slavs. Many precious pieces of sculpture have emerged from these Slave huts. They lived from agriculture and viticulture; grapes were pressed in the ruins of the Temple of Hera. These ancient remains of buildings and sculptures remained a constant gold mine. Lime kilns were built, to which countless pieces of marble and limestone were hauled. But now it was too much for old Alpheios; what other sights had he witnessed along its banks!

Created, not improbably, by breaches of small mountain lakes in its upper reaches, it spreads its broad waters across the Altis terrain and drives the sacrileges from the midst of their gruesome handiwork. The whole is now covered with a thick layer of sand and silt; the silence of death reigns throughout the entire Olympia Valley. Undisturbed, the damaged witnesses of a lost greatness rest in the protective Mother

Earth, until, centuries later, a reverent and loving hand will bring them back into full daylight.

The old world has passed, and who would wish it back? Yet, as we know, Hellenic civilization nourished later generations with its marrow. From the ruins of Olympia resounds a lesson of exalted humanity: that one must elevate the soul above the pressures of earthly affairs by exerting one's strength with a fresh zest for work to achieve a noble goal. And not only the Renaissance, but also the Middle Ages did more justice to the Hellenic world than it ever suspected. While Olympia became a wasteland, the greatest flowering of Christian civilization unfolded in the West. How differently people thought and felt there than in ancient Greece, and yet, despite

all the differences, they moved within similar circles. The Divine Peace of the eleventh century was a timid attempt to lift the world from the desolation of the law of the fist, no different from the Olympic ekecheiria. Just as the Greeks opposed the barbarians, so the Catholic world, with the belief that one stood for higher ideas, opposed those of the Mohammedans: in struggle against an alien principle, one sought strength for one's own - and just as the Greek patriots aroused their people to forget their internal disputes and jointly liberate their brethren from the Persian yoke, the Popes forbade strife and discord when the land where Christ had suffered had to be saved from the hands of the unbelievers. Catholicism was like a single endeavor to wrest humanity from wild passion and discord, and therefore, although the

Gregorys and Urbanuses were so much grander and more powerful, as a Gothic cathedral towers higher than a Doric temple—although in their endeavors they felt they were bringing a heavenly world order down to earth, which in that sense was entirely alien to a Lycurgos or Iphitos—yet here we see the modest endeavor of the Elian men justified by a posterity that knew nothing of them and was separated from them in spirit and mind by the widest conceivable gulf.

It is a fitting expression that humanity always returns to the same thing, yet in doing so does not proceed in a circle, but along the path of a spiral.

Leiden.

A.E.J. Holwerda.

January 1, 1882 Schliemann's Troy. IIios, Stadt und Land der Trojaner etc. von Heinrich Schliemann. With a Selbstbiographie des Verfassers, a Vorrede von Rudolf Virchow und Beiträgen von P. Ascherson u.a.

Journey in the Troas im Mai 1881 by Dr. Heinrich Schliemann.

Heinrich Schliemann now considers it a beautiful illusion

His childhood dreams come true. When one stands atop the hill of Hissarlik in the former Trojan land and then looks down into the excavated portion of that hill, as if into the crater of a fire-breathing mountain, one sees the ruins of a prehistoric city, which he is firmly convinced must be considered Homer's Troy.

It took a prodigious effort to get to this point. When, more than twelve years ago, he believed he should search for the ancient Homeric Ilios among the ruins of the later New Ilion, the Aeolian colony in the land of the former Trojans, he stumbled upon a veritable archaeological goldmine. Nothing was found beneath the city itself, but the hill of Hissarlik, on which the fortress had stood, consisted largely of the ruins of six settlements (not counting New Ilion itself), six cities, in Schliemann's words, one of which had been built on the ruins of the other. The hill, which originally rose no more than 60 feet above the surrounding plain, thus grew a good 52 feet higher and, as the founders of a new city often cast aside some of the rubble of the old one to level the ground, also increased considerably in size. Schliemann dug a quarry through these masses of ruins from north to south and another from northwest to southeast. In the third city, which had apparently been destroyed by fire, he believed he had rediscovered Homeric Troy. The results of these excavations were made known to the civilized world (in 1874). Since then, in 1878 and especially in 1879, assisted by the renowned Virchow and the French engineer Burnouf, he resumed his task and, as far as the research on his Troy, which was his main concern, completed it. All later settlements, insofar as they extended beyond the third city, were demolished. Since the third city was very small, and the hill, as we noted, also increased in width with each new settlement due to the debris thrown aside by its predecessor, unbroken sections of the rubble pile remained around it, and thus it came to lie as if in a crater. A crater, however, not with intact edges; consider only the two grooves that bisect the entire hill. We gained knowledge of the two lower settlements, those beneath the third city, by excavating the ground somewhat deeper in some places. It was especially significant that during the 1879 excavations, the northernmost part of the north-south groove was excavated down to the bedrock over a considerable distance.

In a voluminous volume, the tireless researcher now shares the results of his efforts. All the finds are described in good order and discussed, using the most important information already available. Not only is the material presented, but a start is also made on its processing: comparisons are made with other finds, and historical and archaeological data are gathered that can serve to clarify the matter. The leading figures of science, Max Müller, Virchow, Brugsch, and others, assisted him in this. Besides this, we receive not only a fairly accurate collection of reports on Troy's history, but Homeric geography also receives a comprehensive treatment with the help of various surveys, primarily conducted by Virchow and Burnouf in the Trojan landscape. In May 1881, Schliemann undertook another journey through Troas in the interest of the same cause. I have written down the titles of the large book and the travelogue, which Schliemann considers a new chapter in it, above. We are now better able than ever to form an opinion about the significance of Schliemann's excavations for the expansion of our archaeological knowledge. I would like to draw attention to these books by briefly outlining their significance.

Who were the peoples who lived in Tròas before the settlement of the Aeolian colonists? We are quite certain that the oldest known inhabitants of Asia Minor and the islands of the Greek Archipelago—Phrygians, Lycians, Mysians, Cypriots, and the like—belonged to the Indo-Germanic tribe, and indeed—some more, some less, but all fairly closely—were related to the tribes of European Greece, among whom Hellenic civilization, classical language, and literature later developed. This is already convincingly demonstrated by the remains of their languages, though often limited to only a few inscriptions. As for the ancient inhabitants of Troas, Dardanians, Teukrians, Trojans, the people who, according to tradition, ruled the land before the Aeolian colonists from European Greece settled there, we lack the necessary material to be able to say anything with certainty about their language. Yet, their Indo-European origin and kinship with the inhabitants of European Greece are also not in doubt. The inscriptions of the Phrygians establish this origin and kinship better than that of most other tribes of Asia Minor, and ancient legends connect the Phrygians and Dardanians very closely: Ilos, for example, founded Ilios on the hill of the Phrygian goddess Ate. Overall, it is noteworthy that in the numerous myths and legends connecting European Greece with Asia Minor, nowhere does the idea arise that the inhabitants of both countries were people of dissimilar passions. This is particularly noteworthy, however, with regard to Troas. The Aeolian and Ionian colonists, among whom the Trojan myth series we know from the poems of Homer

developed, must have had, at the time these myths originated, a fairly clear idea of the nature and character of the peoples among whom they had settled. After all, a people needs centuries before it completely sheds its characteristics in the face of a foreign ruler. Now, when in the Iliad the peoples of Asia Minor are depicted in conflict with the tribes of Europe, there is nowhere to be seen anything that hints at a separation of Greeks and barbarians. On the contrary, the Trojans, Danaans, and Achaeans are considered people of the same race, and it is consistently the same pantheon that concerns itself with the fates of both.

We can form some idea of the civilization of these Asia Minor-Greek peoples, who might also be called prehistoric Greeks. The mighty stone walls in the Argive region, commonly called Kuklopian, belong to them. In the oldest cemeteries of Rhodes, among the graves arranged in the Phoenician style, one finds older ones belonging to unmixed prehistoric Greeks. The island of Santorino (formerly Thera) acquired its present appearance through a volcanic eruption around 1600 BC. First, the island was completely covered by volcanic ash from the crater in its center; then the entire central part sank into the sea, leaving only the edges (the present-day islands of Santorino, Apronissi, and Therasia) standing.

Now, settlements have been excavated beneath the ash that covered that island, which are undoubtedly prehistoric Greek. The most important, however, are the discoveries on Cyprus. In 1852, the scholarly world's attention was first drawn to inscriptions on Cyprus, particularly coins that displayed a non-Phoenician-Greek alphabet. Later, the consuls of England and America, Lang and Cesnola, especially the latter, contributed a great deal of new material, and it was the renowned Assyriologist George Smith who found the key to deciphering these inscriptions. We now know a great deal about the language of the oldest known population of Cyprus, and it was undeniably of Greek-Asia Minor origin. Only after the time of Alexander the Great does the Phoenician-Greek alphabet seem to have supplanted this ancient Cypriot alphabet. Where did this latter origin come from? Cyprus was under Assyrian rule at the end of the 8th century, and Dr. Deecke believed he could demonstrate that it derived from Assyrian cuneiform inscriptions. However, very weighty objections have been raised against this view, although presented with great acumen. The Cypriot alphabet is not even a special property of Cyprus. Several Carian, Lycian, Pamphylian, and Cappadocian inscriptions have a Phoenician-Greek alphabet, but also distinct signs from Cypriot. These inscriptions, like those of Cyprus, are of a later date, yet they support the belief that in ancient times the peoples of Asia Minor and Cyprus shared the same alphabet. In Asia Minor, this was replaced by the new Phoenician-Greek alphabet around the 7th century; nevertheless, some signs from the old alphabet were retained there for sounds that they believed could not be properly represented with the help of the new alphabet. On Cyprus, the old alphabet was retained for a century or so longer.

The excavations, primarily those at Cesnola, also provide a clear picture of the ancient civilization on Cyprus and of the Eastern influences that were particularly felt on that island. One need only continue in this direction, and we will soon enjoy a fairly extensive, precise archaeological knowledge of prehistoric Greece. Moreover, there is another very important tool.

At our service: the Eastern and Egyptian records. Just as Caesar and Tacitus inform us about the barbarian Germans, so too do we learn from the relatively highly civilized Egyptians some important facts about the semi-barbarian prehistoric Greeks of the 18th to the 12th century BC. No less clearly than, for example, the column of Antoninus concerning the Germans, the Egyptian reliefs give us a pictorial representation of those ancient barbarians of the Mediterranean coasts. We know that the Phoenicians were already trading and committing piracy on the islands and coasts of the Mediterranean in ancient times. When, around 1800 BC, the Egyptian conquerors turned against Western Asia, the Phoenician merchants submitted to foreign rule without much resistance. Civilized Egypt held many attractions for them. What valuables could be obtained from there to transport elsewhere or to recreate at home!

In a similar manner, though much later, the Phoenicians became intermediaries for the peoples of the West, for example, for the Assyrian civilization. In those early days, the Phoenician influence did not yet penetrate deeply. It was merely a coming and going. Only centuries later, when several islands, such as Santorino and Rhodes, were definitely colonized by the Phoenicians, could we speak of a Greek civilization developing under Phoenician influence. Then, for example, the ancient Hellenic art industry, that of the oldest painted vases, arose, and Phoenician script was born;

74560 Adopted by the Greeks, in recent times it is believed that another people have been discovered who—though certainly not for such a long period—connected the Greek-Asia Minor tribes with the east. In the 14th century, we see, according to the records on the pylons of Karnak, in the famous poem of Pentaura, Ramesses the Great at war with the Chetas—the Hittites of the Bible—who had allied themselves with the Dardani (Dardanians), Mauona (Maeonians), Masu (Mysians), Leka (Lycians), with Asia Minor

74565 peoples, and among them, the Dardanians from Troas. The war ended with a treaty on equal terms, as it was called, with the Chetas, and, in true modern European fashion, with a marriage of Ramesses with the daughter of the Cheta prince. From that time on, the Chetas came more or less under Egyptian influence. We know a few things about this people with a fair degree of certainty; Babylonian documents speak of them with

74570 a certain awe, as early as the 20th century BC. Hebrew tradition also mentions the Chetas, or Hittites, in Palestine before the Israelite invasion; however, very soon after their arrival, they seem to have withdrawn from those outposts. However powerful the Hittites may have been, in the time of the Egyptian king Thothmes III (c. 1700 BC), it was not they, but another tribe, the Ruthennu, who were the dominant

74575 people in Western Asia; they are not mentioned among the peoples conquered by that king; they paid him tribute. However, for Ramesses I (c. 1450 BC), their king, Sapalel, was by far the most formidable enemy in Western Asia; They completely took the place of the Ruthennu. Under Ramesses II in the 14th century, as we have seen, they led a coalition against that king.

74580 In recent times, we have also come into contact with these Chetas or Hittites (not to be confused with the Aramaic Syrians, who lived south of them) more directly. In the immediate vicinity of their land, especially near former Hamath and Aleppo, and later in their land itself, at the site of their old capital, Carchemish on the Euphrates, inscriptions have been found in a very peculiar hieroglyphic script. Inscriptions in

74585 the same hieroglyphic script have been found in various places in Asia Minor, including Cappadocia, Phrygia, and Lycaonia; these inscriptions have also been found on very unusual reliefs. A relief found near Birejik in the former Hittite region itself corresponds entirely with this Asia Minor relief in all its peculiarities. These reliefs have something Egyptian, something Assyrian, very much Babylonian; in

74590 any case, they are entirely oriental in style, so that the idea that they were brought from the west to the east is entirely excluded. There seems no doubt that it was the powerful Chetas or Hittites who brought their art forms and inscriptions to the surrounding, relatively insignificant kingdoms such as Hamath and further into Asia Minor. These monuments and inscriptions can be called Hittite with a very high

74595 degree of probability. The extent of this Hittite influence is demonstrated by a discovery by the English orientalist Sayce. Herodotus saw two reliefs carved into the rocks on the road between Sardis and Ephesus, which he considered them portraits of Sesostris. One of these reliefs had been known for some time; the other was

74600 discovered by Sayce, who also determined that they were Hittite-style and provided with Hittite inscriptions. Thus, we see the Chetas, with their inscriptions and reliefs, firmly on their way to those peoples of Asia Minor with whom the Egyptian monuments present them in alliance. Only Herodotus's two Sesostris portraits are found in the eastern part of the Maeonian land; the other reliefs have been found among the peoples of Asia Minor not mentioned on the Egyptian monuments of Ramesses

74605 II, usually those located more inland. We thus get the impression that Hittite rule extended over those inland regions, so that the inhabitants of those lands could not be described as independent fighters against Egypt on the Pylons of Karnak. The lands along the sea coast, on the other hand, would have remained somewhat independent—perhaps they had to tolerate a single Hittite outpost—but were forced, completely or

74610 partially, to join their powerful neighbor in the fight against Egypt.

Be that as it may, we see here, long before the Assyrians appeared in Western Asia, another people connecting east and west, and there is little doubt that these were the Chetas or Hittites. We should therefore expect Hittite influences in the Greco-

74615 Asia Minor civilization. However, the very fact that we should expect them should make us cautious about believing too readily that we will find them in anything. The material from which we can learn about the Hittites is still relatively limited. Sayce, with the aid of a kind of medal bearing bilingual Hittite and Assyrian

74620 cuneiform inscriptions, has made a not very promising start in deciphering their hieroglyphs. The Hittite reliefs, as we have already noted, have something Egyptian, something Assyrian, but above all a great deal of Babylonian charm; one sees, for example, sphinxes, winged sun disks, goddesses standing on animals, and the like. It is no surprise that the Hittites borrowed much from Babylonia; their empire coincides with Babylonia's earliest period of prosperity, while Assyria was then only in its

74625 early stages of development. Therefore, in the Hittites, we most likely see
transmitters primarily of Babylonian civilization. Their artistic creations, despite
all the imitation, still display something peculiar. Not only did they incorporate
what they adopted to some extent independently, but they also made certain aspects
entirely their own, firstly in terms of costume, with the tall hats with turned-up
74630 brims and the shoes with turned-up points found on all the reliefs, and secondly in
the style of workmanship, where, with a certain predilection, the figures were given
a roundedness and compactness unfamiliar to other Eastern reliefs. Or can Hittite-
Babylonian influences also be detected in the oldest works of art of the Greek-Asia
Minor tribes, for example, the lions from the fortress of Mycenae? Sayce believes so.
74635 Yet, this will not be accepted at face value. Another assertion by the same scholar
is more impressive: that the Asia Minor-Cypriot alphabet was derived from Hittite
hieroglyphs. Leaving aside other circumstances that support this view, there is a
remarkable similarity between various signs.

74640 The Chetas and Phoenicians certainly had quick pupils in our prehistoric Greeks. The
Egyptian monuments bear witness to the first manifestations of their historical life.
The feeling of immaturity in relation to the Phoenicians becomes unbearable to them.
They, too, begin building ships and entrust themselves to the endless plain; an
immense field lies open for their deeds. It was not for nothing that they had become
74645 acquainted with ancient Egypt, which had a civilization 2,000 years ahead of them.
Just as the Germans later did in the Roman Empire, these barbarians from ancient
Greece wanted nothing more or less than to settle in the kingdom of the Pharaohs to
share in its glory and riches. Already under Thothmes III (c. 1700 BC), we hear that
the Danaou (Homer's Danaans), allied with Libyan peoples, had stormed Egypt. Under
74650 Ramesses II, we saw an alliance of Asia Minor peoples led by the Chetas take the
field against Egypt. Even under his son Menephtah, numerous Greek-Asia Minor tribes
formed an alliance on their own (among them, for example, the Akaioeas, Homer's
Achaeans); they landed in Libya and advanced again into Egypt. Inhabitants of Troas
were not among them, for the Turisha, whom Bruges refers to as Trojans, are
74655 considered by Ghabas and Maspero is, with very good reason, considered the Lydian
tribe of the Tyrrhenians. - A hundred years later, the Phoenicians have apparently
been largely driven out of the Greek archipelago, and the Chetan empire is powerless
against the overwhelming power of its former vassals. At sea and along all coasts,
Greek-Asia Minor fleets and armies can be seen; a few tribes ally themselves again
74660 with the Lybians, but the vast majority, led by the Tekkri (Teukrians) and Pelesta
(Pelasgians), focuses its attacks on the east. A land army overthrows the Chetan
empire, allied with Egypt, and approaches the borders; a fleet penetrates to the
mouths of the Nile. There, however, Ramesses III (c. 1200) rises; "one rejoices as at
the rising of the sun"; he is "brave as a bull," "powerful as a lion"; He destroys
74665 "the barbarians," "the peoples of the sea," and seeks them out in their own land;
many cities submit; the names we are given are largely from Asia Minor. Whether Ilion
appears among them is still doubtful. On the temple walls of Medinet-Abu, Ramesses's
deeds are recounted and the battles depicted in relief; prisoners from various
nations are depicted in their national costumes, with their names placed alongside
74670 them.

Better days did not arrive for the Chetan Empire. Less than 50 years later, the
Assyrians under Tuklat-habal-asar pushed westward. Until its complete subjugation to
Assyria in the 8th century, the Chetan Empire enjoyed only a semblance of
independence. Major changes also occurred among the Greeks later. Many European
74675 tribes migrated to Asia; the Aeolian colonists arrived in places such as Troas.
Hellenic civilization developed, and the Phoenicians, retreating to a few islands,
remained the intermediaries between East and West. There was no longer any question
of simply adopting anything. The Hellenes created their own world from Eastern raw
materials. The period we spoke of earlier, that of the Phoenician alphabet and the
74680 oldest painted pottery (800 BC), began.

Let us now turn to the six settlements on the hill of Hissarlik beneath Aeolian
Ilion. It is entirely logical to attribute them to the Dardanians, Teukrians, and
Trojans of Greek tradition and the Egyptian monuments, an Indo-Germanic people of
Greek-Asia Minor origin, subject to varying degrees of influence from the Chetas or
74685 Hittites, Phoenicians, and Egyptians. The excavations should clarify this completely.
The various settlements of Hissarlik exhibit a considerable difference in
construction methods. The first two cities were built of rough, entirely or almost
entirely unworked stones, broken from the nearby limestone mountains. The stones of
the first, that is, the lower city, are quitesmall and somewhat bonded together by
74690 earth; however, not enough has been excavated from that first city to form a proper

picture of it. The situation is different with the second, which was undoubtedly one of the largest of all. A wall of large limestone blocks seems to have surrounded that city on all sides; these limestone blocks were stacked on top of each other, and the oversized openings were filled with smaller stones, so that we have here before us exactly the same construction method as can be observed in the so-called Kuklopic walls of Tyrius and Mycenae. The houses were constructed of similar blocks of stone; However, it appears that walls of loam or clay were also used, naturally mixed with straw, as, for example, in the pile formations of Switzerland and Italy; a single house has been excavated that had walls of small stones bonded with loam, similar to the dwellings found beneath the volcanic ash of Santorino. The houses had multiple stories and probably a flat roof of beams. Houses also stood on the city walls, whose walls thus formed an upward continuation of those walls, in the same way, as has been noted, as in Jericho from the Old Testament.¹ The entrance was on the southwest side. A gently rising street had been artificially formed there, also paved with limestone slabs, to allow for a more gradual ascent of the always somewhat steep hill. One entered the city through a gate with three successive doors. Three houses have been found in this second city, destroyed by fire; the further causes of their destruction are unknown. For some time after its fall, according to Schliemann and Burnouf, the hill was uninhabited, as rainwater apparently created cavities in the rubble.

Virchow, however, doubts this. Then the third city was founded; they simply rebuilt on the rubble of their predecessor. Unevenness was leveled, just as it had been during the foundation of the previous city, and later also that of the fourth, by placing so-called clay cakes in the open holes. Over a large area, the walls of the previous city were also used for this new one. On the south side, however, a new wall of smaller stones bonded with clay was built, thereby extending the city slightly on that side. While on the northeast side, several rows of large stones, one above the other in one place only, were laid across the rubble of the second city. Because these rows of stones were to serve as a wall on that side, a significant part of the second city was not included within the perimeter of the third. This was therefore quite small. One of the two longest sides curved, the other fairly straight, and was no more than 150 meters long. However, houses were also situated outside the walls on this northeast side. On the walls of the second city, to the extent that they were adopted, new houses were built above the rubble of the houses of that second city, so that the walls of those houses also formed a continuation of the city wall.

Primarily, it seems, on the walls that the residents themselves had built (that wall on the south side and the rows of stones on the northeast side, which had been laid across the rubble of the second city), brick walls were constructed as a continuation of the limestone walls. First, a few clay cakes were piled on top of these, then the bricks followed. This is undoubtedly the major step the residents of the third city took over from the two previous ones: that they were the first to grasp a kind of masonry; tiles of clay mixed with straw, hardened in the sun or by fire, were bonded with a kind of cement of pounded tiles and water. Just like those walls, the entrance to the city was also adopted from the previous one. However, above the limestone pavement, a red sandstone pavement was laid. Only the lower section of the gates of the second city remained; it was raised higher, following the construction methods of the third city.

The houses of the third city usually consisted of a ground floor constructed of small, only slightly worked, pieces of limestone bound with a cement of ash, earth, or crushed tiles. The floor was made of clay, spread over the rubble of the previous city or over stone slabs. The floor of the upper floor or floors was formed of beams, like the bottom, covered with clay, which also filled the gaps between the beams. The walls of the upper floors were made of fired tiles; a kind of chimney was cut into them. The roofs seem to have been formed in the same way as the bottoms of the floors: they were therefore flat. Sometimes the lower floor had no door, so that, just like in the pile dwellings, one could only enter the house by a staircase. The ground floor was also usually only the storehouse; if it had no door, one descended into it as if it were a cellar. In these lower floors, one often finds large jars, easily capable of holding a man, storage places for liquids or crops; they were thus truly a kind of cellars or storehouses. Near the city entrance stood a large, rather carefully built house, which Schliemann believes to be the palace of the city's chief; he previously called it simply Priam. Virchow's observation is striking that the construction of the houses of Troas today still corresponds entirely with that of the ancient dwellings on the hill of Hissarlik; the latter has become particularly clear to us through the former. It is, however, a phenomenon that is very commonly observed. For example, in Greece and Italy, one can still, to a certain extent, learn about ancient life through one's own observation. About 50 years ago, Stackelberg,

for example, noted that ancient costumes could be explained by those of modern Greece. It is simply impossible to determine how many thousands of years old many of our involuntary customs and habits are.

74760 The inhabitants of the fourth city again entered their fortress at the same location as those of the two preceding ones. Walls of this city have also been excavated; yet we are unable to form a proper picture of their development. The houses were
74765 apparently built similarly to those of the third city. Like the inhabitants of the Italian pile dwellings, those of the fourth city let the waste of their food and other filth fall down, undisturbed, into the space beneath the upper floor they occupied. The pottery of this city is often somewhat cruder in workmanship than that of the third, and the stone tools are also somewhat cruder. Schliemann believes that after the destruction of Troy, according to him, in the fifth city, a portion of the population remained, but was unable to maintain the higher civilization of its
74770 predecessor. This would confirm the tradition that Aeneas established a kingdom on the site of the ruined city. Based on the information available to us, we cannot form a proper picture of the layout of the fifth and sixth cities. Schliemann believes that the houses of the fifth city were made of wood and clay.

74775 The inhabitants of Hissarlik used stone, copper, and bronze objects; iron is completely absent, with the exception of a knife in the sixth city. However, on the whole, these stone objects are of a fairly high quality. Flint tools are found only in the first, lowest settlement, and even then only in a few. The exquisitely
74780 polished axes of Nephrite, found in the five lowest settlements, are particularly noteworthy; they are not inferior to a bronze axe. Some objects made of nephrite were also found in Swiss pile dwellings and in some other places in Europe. However, this type of stone does not occur in Europe. Among the axes of Hissarlik, one is made of white nephrite, which in the ancient world is found only in the heart of Asia, in the Kuen-Luen Mountains. Were there trade connections between Central Asia and Asia Minor
74785 and Europe in those ancient times, or did the Aryan peoples, when they left the interior of Asia, certainly take with them these very valuable objects? It is worth noting that in the fifth city, stone tools are far fewer in number than in the fourth, and that Schliemann reports none at all from the sixth. One can see that on the hill of Hissarlik, the Bronze Age is gradually replacing the Stone Age.

74790 Bronze objects have not yet been found in the two lower cities, but copper ones have. However, the excavations in these two cities are not yet particularly extensive, and it is therefore somewhat premature to conclude, along with Schliemann, that the inhabitants of the first two cities lived in a copper period, and that the hardening of copper into bronze by adding tin only became known in the third city. Furthermore,
74795 in these two cities, several objects made of gold, silver, and electrum (a mixture of the first two) are found, and in the lower city, a copper knife that has been gilded. In the four upper settlements, bronze objects are very common. That the metals were

worked on the hill of Hissarlik itself is demonstrated by the numerous stone molds found, for example, for arrowheads and baked clay objects, which, according to the
74800 metal flakes on the inside, also served as a crucible. The bronze at Hissarlik was probably not forged. When surveying Schliemann's finds, one is particularly struck by the gold, silver, and electrum objects he found in ten locations in the city of the third city. The largest collection, which he previously called Priam's treasure, lay among the rubble on the city wall not far from the so-called royal palace, where

74805 several objects of precious metal were also found. The principal items found among these treasures are head ornaments, hairpins, bracelets, earrings, cups, jars, a shield, and the like. Among these are pieces whose production, in the opinion of an expert consulted by Schliemann, the jeweler Guiliano, required a very high degree of technical skill. Truly, no Etruscan goldsmith of centuries later would have been
74810 ashamed of the extremely fine granulation. Guiliano cannot fathom how this could have been accomplished without a magnifying glass. The style of decoration also bears no resemblance to an original civilization. For example, a hair needle with a knob of rosettes and spirals, and especially one to the knob of which some finely crafted, extremely small vases with two handles were soldered, rather testify to a somewhat
74815 spoiled taste, which delights in charivaris.

Hard stones for grinding grain, often shaped like a ball, or even a kind of mortar with pestle, are common at Hissarlik, as is so often the case in prehistoric
74820 settlements. Hundreds, indeed thousands, of small stones have also been found there, also a fairly common prehistoric household item. Naturally, the amount of pottery excavated is astonishingly large; some of it was wheel-made, some by hand. Even wheel-made pottery is often quite crude. There is no mention of a kiln in which it was fired; It is so undercooked that it must have been fired before the fire. Many

pots and dishes have a few protrusions cut out, which are provided with holes, were a rope was brought through the pot, either to tie a lid on the pot or to hang it up.

74825 Traces of the rope can still be found in some of these holes. Similar pottery with protrusions can also be found in other prehistoric settlements, for example, in the Italian pile dwellings. The large storage jars, in which a man could easily stand, have already been mentioned; in one of them, which lay long before Schliemann's door at Hissarlik, two people sometimes sheltered from the rain. Furthermore, the pottery

74830 has a variety of shapes. Numerous flat dishes are found among them, which are particularly similar to those from Cyprus, but also suggest others, for example, from excavations in Germany and Hungary. Conical vessels, or spherical ones on three legs with an oylinder-shaped extension upwards, are also found among them. Among them, one frequently encounters conical jugs with long spouts, rising straight up from the

74835 center, which end more or less like an upward-pointing bird's beak, a design that immediately brings to mind similar ones from Cyprus and the ash-covered layers of Santorino and Therasia. Also worthy of note are certain small jars resembling our water bottles, which almost every Egyptian and Cypriot collection—including the Leiden one—contains; jugs with two spouts, also Cypriot in shape; two or three small

74840 cups connected together, also something from Egypt, Cyprus, Rhodes, and Santorino. Above all, however, attention is drawn to the animal-shaped vases, for example, pigs, which often recall some of our children's money boxes. From all Cypriot collections, including the Leiden one, one can find almost identical examples. Animals, no less humans, were imitated in the pottery. On the upper part or lid of many large vases, a

74845 face is roughly incised or sculpted, while on the belly, the female body is crudely depicted. The mouth is particularly often omitted from the face, which is why Schliemann calls these vases "owl-headed vases." Such vases, depicting the human form, are among the most widespread worldwide; they have been excavated in Cyprus, Egypt, Etruria, Pomerania, and America. Cups with two handles attached to the sides,

74850 in which Schliemann sees Homer's *depa amphicupella*, have been found in all five of the upper cities. In the sixth alone, a certain type of cup with two upright handles, which project upwards above the mouth, is very common. Similar in shape to the Greek *kantharos*, but convex at the bottom, without any foot. Cups of exactly the same model are found in Italy. At the sixth city, there is also a peculiar type of pottery

74855 handle, ending in a cow's head. The color of the pottery is often black, dark brown, or red, sometimes yellow, and occasionally green. The more carefully crafted pieces are polished; the stone tools used for this are still found. The decoration consisted of incised, straight, zigzag, and wavy lines, figures reminiscent of a fishbone, circles with a point, and the

74860 like. Often, the incised figures are filled with chalk, which makes them stand out better against the black or dark brown background. Among these thousands of pottery pieces, only three rather insignificant examples of painting can be discovered; the most prominent is a squid depicted with red earth on a lid. This animal is also found on many vases from Mycenae. The incisions on the Hissarlik vases were generally done

74865 with a very unsteady hand; yet, a certain sensitivity to the requirements of proper artistic decoration cannot be denied. The lines are not applied randomly, but in harmony with those of the vase itself; they rise with the ascending walls, or on the wider examples, they curve around, parallel to the upper rim, often from handle to handle; the more striking upper part of spherical vases often bears the main

74870 decoration; the vase surface is often divided into several decorative fields by straight lines. The paucity of different patterns is remarkable, however. The spindle whorls also bear decoration, and this is infinitely richer than that of similar objects from other prehistoric settlements. In this respect, they are also remarkably superior to the vessels themselves. The variation among the patterns is quite

74875 considerable, and these are often truly tasteful. A rather refined artistic sense is particularly evident in the, in some cases, quite clear attempt to have the figures, as it were, participate in the rotating movement of the spindles: lines or figures, which run like the spindles of a wagon wheel from the rim to the center opening of a spindle whorl, are often all curved in the same direction. Very often, especially on

74880 the spindle whorls, that mysterious mark appears,

The cross with angles, which we find in China, British India, Cyprus, Etruria, and other places, even, according to Schliemann's account, on bronzes brought back by an

74885 this sign *Snastika* (or *Sauvastika*), using a Sanskrit word. It is therefore commonly considered to be of Indian origin. Max Müller sees it as a symbol of the sun; others see something else. Animals and people are also depicted on the spindle whorls, though without anything resembling a plastic representation of forms: the body, legs,

- 74890 arms, and horns are represented by straight lines, the head by a circle. Only in the sixth city does one find a kind of intaglio in ivory, depicting a pair of crawling creatures, which truly demonstrates some plasticity. Also worth mentioning are several ivory objects, including a fragment of a lyre, a few knobs of Egyptian porcelain, cylinders, and seals in the Babylonian style.
- 74895 The inhabitants of Hissarlik were likely an agricultural people; large quantities of grains of various kinds, especially wheat, have been found in the burned city. They also engaged in fishing, both at sea and in the rivers, and consumed a surprising number of mussels and oysters; the remains prove this. Similarly, it is beyond doubt that flocks of sheep, goats, cattle, pigs, and horses were herded in the meadows
- 74900 surrounding the hill even in those ancient times. Hares, deer, antelope, geese, and swans were also hunted.
- Script was also well-known in those ancient times. It was Hang who first discovered letters in some signs on spindle whorls, seals and cylinders, and even on a vase, belonging to the Cypriot alphabet, though apparently older in form. Gompertz's first
- 74905 attempt at deciphering it was unsuccessful, and Sayce, in his appendix to Schliemann's book, has also not yet achieved any conclusive results; it remains to be seen whether that will ever be achieved with the limited material at our disposal. Nevertheless, it is a discovery of great significance. That the Cypriot alphabet was not limited to Cyprus alone, but was the pre-Phoenician alphabet of all of Asia
- 74910 Minor, is strikingly confirmed by the fact that we find it in such ancient Asia Minor settlements as those on Hissarlik.
- Which gods were worshipped on that hill? Noteworthy is the lead idol of a female goddess, very similar to idols of Babylonian origin; Sayce speaks of the Babylonian Nana. Furthermore, a highly crude idol, made of baked clay, marble, or carved from
- 74915 bone and ivory, is found exceptionally frequently. A distinction between head and torso is the most striking feature of its plastic form; a face is incised, sometimes the hair is somewhat indicated, and often the separation of head and torso is also indicated by stripes, a kind of collar. All those depicted by Schliemann, except one from the sixth city, lack a mouth. In a few cases, an eye is also omitted. Schliemann
- 74920 sees in all these, and also in the owl-headed vases, images of the Glaukopis Athenaeum, already familiar to us all from our reading of Homer at grammar school. The word "glaukopis" is usually derived from glaukos, "gray," and a root, which is given the meaning "eye," so that "glaukopis" means "gray-eyed." Schliemann thinks of glaua "owl" and translates: "Athens with the owl's face."
- 74925 There is indeed much to be said for that opinion. Homer certainly did not imagine either goddess with the face of an animal. But just as a rudimentary organ speaks of past life activities, so too would those mechanically repeated epithets preserve an ancient conception, completely foreign to the minds of those who used them. When
- 74930 people later attempted to grasp the meaning of these words, they arrived at those common explanations known to us. Max Müller declared to Schliemann that he was willing to accept his opinion, provided he was also shown the booôpis Hêrê, Hera with the cow's face, not, as had been previously explained, with cow's eyes. Schliemann went to Mycenae and excavated cow heads and cow figurines near the temple of Hera. Has the matter really been settled? Some believe there are etymological objections to
- 74935 Schliemann's explanations. I see, then, that this is so rarely the case that it is precisely the etymology that most recommends Schliemann's opinion. Has anyone ever properly understood what a cow-eyed Hera means? I truly don't believe so, and the root "op" is at least as reminiscent of the face as of the eye. "Aithiops," the Ethiopian, is certainly not the man with the brown eye, but with the tanned face, or,
- 74940 to use a word, while the formation of Homer's names booôpis and glaulcoôpis fully agrees,² the girl's name Rhodoôpis certainly does not mean "rose eye" but "rose face." When Homer has brazen ladies called kunoôpis,³ the translation "dog-eyed"—dogs were considered impudent by the father of the diocese—is highly commendable in terms of meaning, but perhaps just as easily, that brazenness can be found in the animal's
- 74945 entire snout. One must then assume that in ancient times, Athena was sometimes depicted as an owl or with an owl's face, and Hera as a cow or with the face of a cow. Is that conceivable? Why not? The ancient Greeks, like no other people, began with a creation like Praxiteles' Hermes. They, to quote Thucydides, became Hellenes from barbarians, and in that barbaric era, like so many other barbarians, had
- 74950 shapeless objects—the ancient statue of Hera on Samos was a block of wood—and wholly or partially animal-shaped monsters as idols. A few examples of the latter have even been found here and there. The only question is: did people ever imagine Hera with a cow's head, Athena with that of an owl? This is not unlikely regarding Hera. Io, her mythological doppelganger, is known to be transformed into a cow. Furthermore, she

74955 was very easily identified with the Egyptian Isis; for example, the Hera at Olympia
 wore the coiffure or crown of Isis on her head. Now, in an appendix to Schliemann's
 book, Brugsch recalled that, according to an Egyptian myth, after Horos cut off her
 head, Isis received a cow's head from Thoth in its place, and there can be no doubt
 74960 that Argos, preeminently Hera-worshipping, came into contact with Egypt in ancient
 times via Libya. Egyptian monuments, as we have seen, already appear in the time of
 Thothmes III (c. 1700). Libyans and Danaans allied against Egypt, and the Greek
 legend has Danaus, the mythical progenitor of those Danaans, whom she calls the
 brother of Egyptus, settle in Argos from Libya. When Tsis fled from Seth, she
 74965 transformed herself into a cow—the Egyptian myth continues—and thus she arrived in
 the province in the west of the empire, inhabited by Libyans since very ancient
 times. There, as Brugch demonstrates, Isis was especially worshipped as a cow, thus
 in that part of Egypt with which, according to the information on Egyptian monuments
 and the Greek Danaus saga, we must consider the Danaans associated. This is the case
 with the Heres the cow. Regarding the glaukopis Athena, no such evidence has yet been
 74970 found. Yet, how little has been done on the religious history of the Greek people! It
 is clear that the entire question would be completely settled if we possessed a
 statue of Hera with a cow's head and one of Athena with an owl's head. Did Schliemann
 find them? This, I think, must be denied. Neither the owl-headed vases nor the idols
 have anything that gives the impression of an owl, except that they lack a mouth.
 74975 Now, that could simply be a mistake, just as an eye was also omitted from another
 idol. A statuette found on one of the Greek islands, which incidentally stands much
 taller in terms of sculpture than any of Hissarlik's statuettes, even lacks
 everything except its nose. Yet, one might argue, all but one of the Hissarlik's
 74980 statuettes that Schliemann published lack a mouth; so do all the vases with a human
 face, which he depicts in his current work. However, in the photographs of the found
 objects, which he previously published, several appear where the mouth is clearly
 visible, and this, in my opinion, completely negates all evidence for the deliberate
 omission of the mouth. And now regarding the Hera Booôpis, among the gold, silver,
 terracotta cow heads, and terracotta cows that Schliemann published in the German
 74985 edition of his "Mykenae," there is, in my humble opinion, not a single one that one
 has the right to consider idols. That such statuettes are found in or near a temple
 of Hera should come as no surprise. The cow was a favored sacrificial animal for
 Hera, and therefore cows could very well have been given to her as so-called votive
 offerings, small votive gifts. Animals used as votive offerings can be found in all
 74990 museums, for example, doves dedicated to Aphrodite. The only specific idol, as far as
 I know, with a cow's head was found by Cesnola in Cyprus; it has a human torso and
 arms, but the head of a cow. However, there is no reason to consider it a Hera. Thus,
 Schliemann's opinion remains merely a guess, a not implausible guess perhaps, but one
 that is in no way supported by the archaeological discoveries that gave rise to it.
 74995

We can now form an idea of the state of civilization on the hill of Hissarlik before
 the Aeolian colonization naturally returns to the question: were they settlements of
 the Greek-Asia Minor tribe of the Dardanians, Teucrians, or Trojans? And indeed,
 after examining the finds, this can be less doubted than ever. One need only consider
 75000 the Kuklopien architecture of the second city and that of its houses, which were
 built along the lines of those of Santorino, but above all, the Cypriot alphabet. The
 pottery also firmly places the inhabitants of Hissarlik among the prehistoric Greek-
 Asia Minor tribes. Now, it is beyond doubt that more original states of civilization
 very easily exhibit some similarities, and that only in a period of more advanced
 75005 national artistic development can peoples be clearly distinguished by the products of
 their artistic crafts. Hence the similarity of the finds at Hissarlik with that of
 all sorts of finds from all corners of the world. However, no similarity extends
 across so many objects and is so evident in the smallest details of workmanship as
 that with the oldest pottery from Cyprus, Rhodes, Santorin, and Therasia—in other
 75010 words, with the pottery of prehistoric Greeks. That tribes of Asia Minor (Greek)
 lived at Hissarlik is certainly not open to doubt. It is still possible that the
 various settlements, or some of them, were inhabited by different peoples, and since
 this is indeed assumed by Schliemann and Virchow, it is worth pausing for a moment.
 We must begin by defining the point in question more precisely. If one means that
 75015 different peoples of the same tribe succeeded one another on the hill of Hissarlik,
 then that is quite possible. For example, one could assume that the Dardanians,
 Teucrians, and Trojans alternately held sway and inhabited the castle of Hissarlik.
 However, this matter will likely never be resolved from the archaeological findings;
 we would have to imagine the civilization of these tribes to be so similar that
 75020 making a clear distinction would be impossible. However, if one means that peoples of

different origins ruled at Hissarlik, that, for example, a people completely unknown to us, not of Asian Minor Greek descent, would have inhabited the lower settlements, then that is highly unlikely at this stage. We know the two lower settlements, especially the one below, only imperfectly; yet, certainly from the second, but, I see, also from the first, vases with human faces have been unearthed, all of which correspond fairly well in type at Hissarlik. Certainly in the five upper settlements, but probably also in the lower ones, one finds the very same crude idols discussed above. Large storage jars, capable of holding a man, have also been recovered from the second settlement, as well as from the higher ones. Schliemann attaches great importance to the lack of large storage jars in the first city; however, assuming they are not also found there during further excavation, could the inhabitants of the second city have been the inventors of these large jars? The fact that the pottery of the fourth city is somewhat cruder certainly cannot be considered here. Furthermore, Schliemann points out that in the lower settlement, certain large, glossy black bowls shaped like basins are found in large quantities, of which not a single example is found in the second settlement. He refers to an expression by the Etruscologist Dennis, who lived in Eugel, that a people does not simply abandon the style in which they produce their pottery, for example. Firstly, however, what one might call style—a peculiarity of art form, cherished and maintained as an expression of its innermost being—is only present in principle in products of applied art, such as those found on the Hissarlik hill. Secondly, the second town also has its own glossy black pottery, so that, if I understand correctly, the matter boils down to this: certain bowl-shaped dishes appear in the first town, but not in the second. One would hardly want to see a stylistic difference in national art industry in this. Therefore, in all or most of the settlements on Hissarlik, one likely encounters the same phenomenon as in the Italian terramares, the remains of Italian pile-dwelling villages,¹ and on the Dutch terps: multiple settlements of the same people, in different periods of their development, lie one above the other. Pigorini believes that the ancient inhabitants of the Italian pile-dwellings themselves sometimes set fire to their dwellings when they felt the need about new ones. This same is not unlikely for some of the towns of Hissarlik. For the pile dwellings, fire was the simplest means of extermination, not so for the stone towns of Hissarlik. There, a fire is more likely to be attributed to an accident or a foreign enemy. Of the six settlements, only one has now been destroyed by fire (a few houses in the second town). If one does not want to assume that all five of the remaining towns were destroyed by earthquake, then it is certainly a not entirely objectionable assumption that the inhabitants themselves each time tore down one town and built a new one on the rubble, when over time their wretched dwellings, which certainly did not differ much in sturdiness, had become somewhat unusable.

In one respect, Schliemann has indeed demonstrated a rather significant difference between one of the settlements and its predecessors. The sixth city not only ranks somewhat higher than the preceding one in some of its artistic productions, but a large number of those cups with two high-standing handles were also found there, which, as Schlieman rightly observed, bear a striking resemblance to similar objects from Italy, including a large number of those handles ending in a cow's head. However, this can apparently only be a case of a new series of objects blending with the old, not of a completely new civilization. Schliemann explains the matter thus: the Tyrsenians, the ancestors, as is often believed, of the Etruscans in Italy, emigrated from Lydia, according to legend; those cups and cow's heads are therefore not unlikely to be of Lydian origin; the Lydians ruled over Troas; the art forms that the Tyrsenians brought to Italy, the Lydians brought to Troas. I will now leave aside the fact that we know nothing of Lydian rule over Troas before this country was colonized by the Aeolians; only Gyges, in the 7th century, subdued that country. The entire question of Asia Minor influences on Etruscan civilization can also remain undiscussed. Indeed, there is insufficient basis for the assertion that these cups and cow's heads are uniquely Etruscan. It is known that the Etruscans are, in any case, a completely different people than the so-called Italic tribes, to which, among others, the Latins belonged, and now cups resembling the Greek kantharos are found in ancient Italian graves as well as in Etruscan ones. As for the cow's heads, so-called crescent-shaped handles have been excavated in Italy, including in the terramares; Schliemann believes that the cow's head is the older form of these handles, which would then be a simplification in that only the horns (half-moons) would remain. This in itself would certainly not be impossible. But what remains of the entire reasoning when one considers that these half-moon handles are precisely not found in Etruscan settlements, so much so that they are usually seen as the most consistent characteristic by which one can distinguish Italian settlements from all other ones?

Greek influences in Italy are very old, and it is not inconceivable that these cups are truly crude imitations of the Greek kantharos. In that case, it would be obvious to assume similar European-Greek influences in the sixth city, which one could then consider as precursors of the complete Hellenization by Aeolian colonists. However, everything here remains conjecture. The settlements on Hissarlik belong to an Indo-Germanic tribe, and it is obvious to draw a closer comparison with those of other Indo-Germanic tribes, including those with whom the relationship was not as close as with the other Greek-Asia Minor peoples. We have already discussed the Italian pile dwellings; these are usually not situated on the shores of lakes, like the Swiss ones, but rather above ground level. Now, the pile dwellings of the Italian terramares were most likely, and almost certainly many of them, the dwellings of the Indo-Germanic people of those ancient Italians, the ancestors of, among others, the Latins. The similarity between these pile dwellings and the houses on Hissarlik is greater than one might superficially think. Whether one builds one's actual dwelling on stilts or on a foundation wall of stacked stones, dug from the neighboring mountains, makes little difference. The main concept remains the same: a dwelling place elevated above the ground. The pile dwellings had walls of loam or clay, as did the ancient dwellings of the Celts and Germans. Such walls were also in use at Hissarlik, for example, in the second town, and when brick was used, clay or loam was used as a floor covering. The similarity between the residents of Hissarlik and the ancient Italians, in the way they dealt with their waste, have already been pointed out. The ancient Celts, Germans, and Italians lived in a period of transition from the use of stone to bronze objects, as did the inhabitants of Hissarlik. Their stone tools for grinding grain are not noticeably higher. Among their pottery, one also finds very crude examples. The kneading of prongs to thread ropes through them was, as we have seen, also known to the Italians. Like their relatives, the Hissarlik inhabitants did not fire their pots and pans in a kiln. Painting vases is a peculiarity, especially of later Hellenic civilization. Like the ancient Italian tribes, the Celts and Germans, the Hissarlik inhabitants decorated their pottery almost exclusively with incisions. Despite all similarities, however, there are also significant differences. In the third city, brick came into use; The pile dwellings lacked them; Tacitus explicitly states that the ancient Germans were unaware of them. While the inhabitants of Hissarlik were in that period of transition from stone to bronze, like other peoples, their stone objects certainly held a higher status. Among them, common flint was a rarity, not a major commodity. As for the pottery, a large portion of that at Hissarlik was made on the wheel; this tool was unknown to those other peoples. Furthermore, one should also note some objects that demonstrate such a high level of artistry and development of taste that all comparison, even with the other finds at Hissarlik, is completely negated. One need only consider several objects in these so-called treasures. Among such people, one is fully justified in concluding that they were imported from abroad. The cities at Hissarlik, therefore, demonstrate an original Indo-Germanic civilization; However, important principles of higher development are already emerging, although the new still stands alongside the old-like, for example, wheel-thrown pottery alongside hand-made—and thus there can be no question of a new, independent state of civilization. The question now is: to what can this nascent progress be attributed? These objects, undoubtedly imported from outside, already suggest foreign influences. This, however, is more evident in another way.

Can one speak of originally Indo-Germanic art forms? It was Conze who, in 1870 at the Vienna Academy, believed he could answer that question in the affirmative. On the oldest painted Greek vases—the Leiden Museum possessed the most interesting examples at the time, but since then, due to various excavations, especially in Cyprus and Mycenae, that number has greatly increased—one finds all sorts of geometric figures: concentric circles, often several sets next to each other, usually connected by tangents at the bottom of one set and the top of the other, zigzag lines, borders (so-called Greek borders), diamonds like those on a chessboard, and the like, as well as some rough beginnings of depictions of animals and plants. These decorations were applied with a keen sense of the demands of artistic decoration; borders such as borders actually serve as rims; decorations are found primarily from handle to handle and on the most conspicuous parts of the vase. The surface to be decorated is often very regularly divided into fields; in short, there is a correspondence between the lines of the decoration and those of the vase to be decorated. Today, the same patterns can be found, incised, on Germanic and Celtic pottery, and to a greater or lesser extent, with due regard for the same principles of artistic decoration. Just as one now ascends from the community of languages among the Indo-Germanic peoples to a single original Indo-Germanic language, Conze believed that this correspondence in

patterns and style of workmanship could lead to the conclusion that there was a certain number of ancient Indo-Germanic art forms, common to the tribe before its split into different peoples. However, Helbig [2] has since pointed out that in the Italian terramares, of which so many have been excavated, nothing of this decorative style can be found on either the vases or the spindle whorls. Only in the later, oldest Italian pottery do the patterns appear, but applied haphazardly, without regard for the simplest requirements of artistic decoration; a piece of metal, for example, skewed, in the middle of the body. Helbig makes it very likely that these patterns are of oriental origin and were introduced to the Greeks and Italians by the Phoenicians, and indeed, that they also came from that direction to the ancient Celts and Germans. These were still in a very original state, while the peoples at the center of the earth were still in a very original state.

The Phoenicians, and later the Greeks and Romans, were already at a very high level of civilization. Archaeology often astonishes us by the far-reaching influences of trade. But didn't Barth also find pieces of cotton from a Manchester firm among the Negroes of the Niger? The Italian terramares, though they probably haven't remained entirely free, have apparently been subjected to such foreign influences to the slightest degree; they therefore date back to a relatively ancient period. Therefore, they best enable us to become acquainted with the true ancient Indo-Germanic civilization.

And now the settlement at Hissarlik. The lines and figures on the pottery are drawn with a very unsteady hand, but nevertheless, as we have already pointed out, the awakening sense of the demands of artistic decoration, which the ancient Italians completely lacked, is very clearly visible here. Of Conze's Indo-Germanic patterns—and this is certainly quite remarkable—none are found in these Indo-Germanic settlements, except for the zigzag line, certainly one of the most obvious. The patterns on the vases are not significant; however, those on the spindle whorls, though completely different, are in no way inferior to Phoenician ones. We see foreign influences acting on the civilization of Hissarlik in a similar way as the Phoenicians later did on that of Greece and Italy.

Therefore, if the fact that external influences did affect the civilization of Hissarlik is fairly well established, the question naturally arises: what were these? We now recall what was noted above about the Phoenicians. Their more profound influence on Greek civilization (except possibly on some islands like Cyprus and Santorin), that influence most clearly visible in the painting of vases and the adoption of the alphabet, is certainly not much older than the 9th century; it was an influence established through colonization and regular peaceful intercourse. The ancient inhabitants of Hissarlik did not experience such intercourse with the Phoenicians; it coincides with Aeolian Ilion, from which Schliemann has therefore disclosed some shards of that ancient painted pottery. Before that time, the Phoenicians traded with the Greek peoples of Asia Minor as with wild tribes; they occasionally brought something there, but were often more robbers and invaders than merchants. A similar Phoenician influence is, I believe, quite plausible now also at Hissarlik. At that time, we are especially thinking of Egyptian goods transported by the Phoenicians. Just as on Cyprus and other islands, some unique Egyptian pottery forms have been discovered on Hissarlik, such as the combination of several small cups. Consider also Egyptian porcelain and the use of the wheel in pottery production, which was common among the Egyptians in ancient times. We can also imagine the so-called "schatteners" (stoves) being better introduced from no place at that time than from Egypt. All the major Egyptian museums, including the one in Leiden, possess examples of fine Egyptian granulation. Yet, much, and in fact the most important, likely points in another direction: the Babylonian seals and cylinders, that lead idol, and above all the use of bricks. The Babylonians primarily used these for building, and among the Babylonian tiles there are some—for example, only sun-dried—that are not much better crafted than those from Hissarlik. The Babylonian example would then have helped the inhabitants of the third city to bake tiles. The ivory found at Hissarlik is not unlikely to have originated from Egypt, but it could also have been brought there from the Euphrates in those ancient times. Herds of elephants grazed there at that time; according to Egyptian documents, the army of Thothmes III enjoyed hunting these animals there. The question becomes: who were the intermediaries in transmitting this Babylonian civilization? And given the above, one can probably think of no other people than the Chetas or Hittites. If it is confirmed that the patterns on the spindle whorls are at least partly Babylonian in origin, then the Chetas would occupy a position among the Greco-Kinsä-Asiatic peoples of that earlier period, entirely similar to that of the Phoenicians later:

75220 they would owe them an incipient artistic development, manifesting itself in pottery and spindle whorl decoration, and an alphabet. What we know of the Chetas and Asia Minor fullers makes such a steady and peaceful influence of the civilization of one people on that of another quite possible. Centuries before the dominant influence of the Phoenicians, we thus see an attempt among the Asia Minor peoples, under Hittite influence.

75225 Athenian tribes led to what I will call Hellenization. This attempt failed. When, later, with Phoenician help, Hellenic civilization began to develop to its full potential, it overwhelmed those first principles, incapable of any further effort, and spread beyond them: the Aeolian settlement over the ancient Dardanian.

75230 Accurately determining the influence of the Chetas on the hill of Hissarlik is a very important matter. When does it begin? With the third city? Everything is still too uncertain. One thing is certain, however, that we have a good chance of obtaining an excellent means of determining the time. If, according to what we have stated above, the flourishing of the Chetas fell between 15 and 1300, then the beginning of the

75235 Chetas' influence on Hissarlik also occurred during that time. If the excavations make it highly probable that we must imagine the inhabitants of Hissarlik in some degree of contact with the Phoenicians and in fairly close contact with the Chetas, then it becomes all the more likely that I am dealing here with Dardanian, Teucrian, and Trojan settlements. Were the cities of Hissarlik capitals of Troas, or did

75240 Homer's Troy lie beneath them? This is so little a foolish notion that one can safely say that, according to the data available to us, it is the most likely guess. The inhabitants of Aeolian Ilion had no doubt that their city stood on the site of ancient Troy or Ilios. The existence of this belief is demonstrable—Schliemann is undeniably correct—in the fifth century BC. Is it so implausible that the first

75245 founders of New Ilion knew that the ruins on which they built were those of the country's ancient capital, and can't this tradition, whose existence can be proven as early as the fifth century, be considered a reminder of that fact? Only in the Alexandrian period did a learned woman from Alexandria, Troas, named Hestiaeae, and a certain Demetrius of Skepsis, assert that ancient Troy was not located on the site of

75250 later Troy, but further inland, on the site of the then "village of the Ilians." Professor Mahaffy, in an appendix to Schliemann's work, has sharply exposed the insignificance of all the arguments advanced. The argumentation is entirely in the style of the artificial debate of the old schools of rhetoric. One of the arguments, we know from Strabo, is that in the Iliad the statue of Athena is depicted seated,

75255 while it stood in New Ilion; another, that according to Homer, Ilios was destroyed, which would mean that all the city's stones were removed. One sees how little such opponents even realized what they actually had to prove; at most, they prove that Aeolian Ilion was not the Ilios of Homer, an effort they certainly could have spared themselves entirely. The truth is that after Alexander the Great, New Ilion enjoyed

75260 great prestige as the city of Homer's songs; drawing a sharp distinction between Old and New Ilion was not in their minds: Aeolian Ilion was the city of Hector and Priam, just as Athens was that of Codros. The jealous neighbors could not grant her that honor, and, fully confident in the formidable strength of their rhetorical weapons, those writers from Alexandria, Troas, and that writer from Skepsis, turned against

75265 the claims of the much-envied capital of their region to be Ilios, Homer's Troy. Therefore, we should not attach much value to the opinion of these people. In more recent times, many believed that ancient Troy must have been located on the heights of Bunarbaschi, a considerable distance south of Hissarlik. Count Moltke, when he wrote "Briefe über Zustände und Begebenheiten in der Türkei" (Briefs on Subsistence

75270 and Belongings in Turkey) a good forty years ago, also concurred with this opinion; "his military instinct" told him that the main fortress of the country must have been located on that height. It is a pity that the inhabitants of Hissarlik, when choosing a site for their fortress, were unable to seek the advice of the greatest general of our time; but such arguments are of little use. The main argument of the Bunarbaschi

75275 advocates is that those two springs, one cold and one hot, that Homer speaks of, would actually be found nearby. However, there are no fewer than forty springs there, all cold. However, both Schliemann and Virchow, as well as the Bunarbaschi advocates, attach far too much importance to what Homer reveals about Troy's location. Schliemann argues, for example, that the area surrounding the Bunarbaschi hill is too

75280 steep for Hector and Achilles to have circled it three times, one following the other. We will return later to the fact that Homer in no way offered any representation of the actual ancient Troy and it is certainly not so very difficult to demonstrate that the poet or poets of the Iliad, even if they knew Troas, paid very little attention to topographical accuracy. Of greater significance is that,

75285 although some remains of walls are found at Bunarbaschi, these are certainly of relatively late date. Nor are any traces of an ancient settlement found at the site of that so-called "village of the Ilians." A surprisingly large number, however, as we know, are found at Hissarlik, the place where a very credible tradition sought ancient Troy. Which side is most likely? Schliemann's journey last May also aimed to

75290 locate other prehistoric settlements in Troas. He found none. Regarding, more specifically, the third city, Troy. Considering what was noted above, that it is not improbable that the inhabitants of Hissarlik, like those of other prehistoric settlements in various periods of their history, established one settlement above another, it stands out that several, or perhaps even all six cities,

75295 could have been Troy. However, the third city was burned, and that was certainly done by the Achaeans and Danaans of the Iliad. Quite possible. That the Trojan legend is based on historical truth is not implausible. But how much? This is truly not so easy to determine. That the burning of Troy was a historical fact is not proven in the least. I would like to propose another assertion, namely this: the peoples of Asia Minor, under the hegemony of the Teucrians, attacked Ramesses III; The king enters Asia Minor, subdues many cities—all of this, as we know, is historically highly probable, almost certain—and here the conjecture begins—burns the capital of the ringleaders, the Teucrians. I'm not putting forward this conjecture at all because I attach scientific value to it; I simply ask: is it so much less probable than

75300 Schliemann's? I want to propose a third conjecture, possibly more probable than all the others. Only three skeletons have been found in the entire third city, two of them, evidenced by the fragments of helmets found with them, belonging to soldiers. Couldn't one argue that such a small number doesn't suggest a fortress taken by storm, and that the third city therefore most likely caught fire by accident? When the Homeric songs originated, the third city had long been buried, and Aeolian Ilion had probably already been founded, whose fortress occupied only the hill of Hissarlik, the site of the entire ancient Ilios. Centuries separated the production of the Iliad from the heyday of ancient Troy; the cities of Hissarlik were still largely ancient Indo-Germanic settlements; the poets of the Iliad lived in an

75310 environment that was already, so to speak, Hellenic; the products of arts and crafts, which they saw around them, according to various indications, were already at the highest stage of development achieved by the Phoenician-Greek pottery mentioned above. Need I still bring up the other evidence for the relatively late composition of the Iliad? Truly, one has no right to consider Troy, as Homer imagined it, anything other than an image of poetic fantasy, modeled on the most brilliant the poet knew in his time—and if anything can confirm us in this opinion, it is those small and miserable citadels of loam and clay on Hissarlik, the Troy of reality. Therefore, nothing whatsoever can be deduced from Homer's descriptions regarding the topographical condition of the latter, and when Professor Virchow tasks philologists with carefully examining the extent to which these descriptions, for example, that Achilles and Hector circled the city three times, correspond with the condition of Troy on Hissarlik, then these gentlemen are perfectly justified in replying to the great naturalist that they have better things to do. Schliemann, too, now fully realizes that there is a startling difference between these two Troys, and that Homer could not have known anything about the Troy of reality. Yet, he does not yet draw the natural conclusions from this insight. Nor does he grasp the consequences of this astonishing gulf between the civilization of Hissarlik and that of the Homeric songs. Archaeology can render great services to philology by transporting the philologist to some extent into the material environment in which the writers he wishes to explain lived; these services cannot possibly be proven by the discoveries at Hissarlik to the Homeric interpreter, for the simple reason that Homer did not live in an environment like that of Hissarlik.

75325 One wouldn't want to make the old bard into Walter Scott or Ebers, who, through long study, managed to transport himself to a world that had passed centuries ago. It is entirely in the nature of such folk poets to embellish the past with the utmost naiveté, using what they saw around them. That's why, for example, in Homer's description of Achilles' shield, the archaeologist asks: what was the driving gear the poet had in mind when describing it? Not: what did the shields worn at the time of the Trojan War look like? Attempts to explain Homer's use of finds at Hissarlik have therefore not yielded much. Schliemann himself attaches the highest value to his explanation of the *depas amphicupello*. In Aristotle's time, it was seen as a cup, which was, on the contrary, a lace cup. Schliemann, as we know, considers it a cup with two handles, of which many were found at Hissarlik. However, leaving aside the fact that *kupellon* means cup and *amphi* on both sides, and therefore the explanation from Aristotle's time is truly not so objectionable, leaving aside even the fact that

75340

75345

75350

double cups have been found, which Homer could very well have envisioned,³ I would point out that there is absolutely no need to speak of an archaeological explanation of the word based on finds at Hissarlik. No museum lacks dozens, even hundreds, of "kantharoi," "skuphoi," and "kulikes," Greek cups with two handles! Such cups were therefore equally well known in the good old Greek period. Therefore, one can very well imagine them among the objects from Homer's circle. Even if we were to admit that Schliemann's explanation of that word is correct, the discoveries at Hissarlik would no more confirm that explanation than a hundred others.

I hope this gives some idea of Schliemann's work on Hissarlik. The diligent researcher has sometimes been compared to an alchemist, and there is undoubtedly much truth in that. His philosopher's stone was Troy, and in his eagerness to find it, he didn't ask first of all, "What is it?", but "Is it Homer's Troy?" Even the defense of a Virchow cannot detract from the fact that the layers situated above the third city, above his Troy, were eroded away somewhat too hastily, so that we could have been much better informed about them than we are now. But let us not forget that the alchemists founded chemistry, and above all, that it is no flattery when Virchow claims that the romantic digger has now become a learned man of great wealth. Even if Schliemann's errors and mistakes were far greater than they actually are, who would dare to hold them too high against him? "He who has loved much, much will be forgiven," and he did love much, the office-goer of the Gentlemen Quien, who did not forget the ideals of his youth, whose holy enthusiasm, the heavenly driving force in our earthly existence, was no more suppressed from his soul by sorrow, hard, mindless labor, or the indifferent treatment of those who did not suspect what a fire burned in the soul of that poor young German—as later by the sweet lure of wealth acquired through his own efforts, which here more than ever seemed to justify a life of peace and ease. The Handelsblad did a good job of bringing Schliemann's account of his own life to the attention of its readers; it certainly deserved a separate publication, which would bring it more consistently within everyone's reach. And I wouldn't want to give it to just aspiring young people: frankly, to our entire student class. Schliemann is (was?) a dilettante. A terrible word; we are far too learned to care about dilettantes. We are armed against dilettantism from head to toe. From cradle to grave, we are accompanied by curricula, exam programs, acts A, B, and C; our universities are entirely geared towards cultivating someone, in the best known way, for one of our many doctorates. We are indeed solid people. But do we have all we need? Are we also sufficiently imbued with that divine breath that set stones in motion and created life in "the valley of the dead"? Oh, when we are once again undergoing or having taken an examination, let us then take up this biography of Schliemann to refresh our souls with that sacred fire, without which no poet or artist, nor indeed any man of science, has ever achieved anything great. Dr. Schliemann may be a dilettante, but he has rendered greater service to the advancement of our knowledge than many a half-dozen bookish scholars. Leiden.

A.E.J. Holwerda.

January 1, 1884 **The Attic People and the Art of Phidias.**
Since Winckelman

At the beginning of the Pompeian excavations, we were living, as it were, in a second Renaissance period, one that, though profoundly influential on the development of art, nevertheless bore a more scientific character. It connected with archaeology and philology; the principle of historical treatment, which plays such a prominent role in the study of the spiritual sciences, especially in our time, was also very strongly felt in it; it is, to put it briefly, archaeology first and foremost. The results of its naturally more deliberate and systematic investigations were astonishing. It managed to bring a number of works of art within its reach, several of which, through their high intrinsic value, eclipsed everything admired by the old Italian masters.

No new acquisition, however, was as significant in itself and in its consequences as that of the remains of the Parthenon. Apparently, shortly after the fall of the pagan world, this most magnificent temple of antiquity was converted into a Christian church. It naturally suffered greatly in the process; nevertheless, it remained in a relatively good condition throughout the entire Middle Ages. Only in recent times did the actual work of destruction begin. In 1687, the city of Athens was besieged by the Venetians. When they learned from a deserter that the Turks were storing a large quantity of gunpowder in the temple, they immediately turned their artillery on it.

And indeed, after some time, a bomb landed right in the gunpowder store. The entire center of the building exploded, so that some marble blocks even fell under the besiegers. Three hundred men, women, and children were buried under the rubble. And since then, the work of destruction, which had begun on such a scale, has continued unabated. The building, now essentially a ruin, became an inexhaustible mine for the lime burners. The opportunity also became too tempting for foreigners visiting the castle to take some of it all home. Some officers of the Venetian army, which had occupied the castle for some time, had already acquired a piece of sculpture as a commemorative piece, and Commander-in-Chief Morosini even wanted to have a pair of horses and the statue of Poseidon removed from the west facade as a token of victory. This was done very clumsily. The heavy marble pieces fell down as soon as they were dislodged, smashing to the ground in a thousand pieces. Later, others also took quite a bit, and this misery naturally didn't diminish when Greece began to be visited more by travelers from various countries. Increasingly, Phidias's works of art would have disappeared, piecemeal, except in lime kilns, from the numerous small collections of art lovers throughout Europe, had Lord Elgin, British ambassador to Constantinople, not acquired them at the beginning of this century. Through a firm, this "faithful friend" of the Porte obtained permission for his deputies to construct scaffolding, to shape, to measure, and to conduct excavations in the fortress of Athens, and "should they wish to remove any blocks with ancient inscriptions or figures, no obstacle should be placed in their way." The wishes of these deputies gradually extended to almost all the sculpture found on or near the Parthenon. The noble Lord spent a significant portion of his fortune, 62,440 pence, to, as the well-known English slogan went, "transplant ancient Greece to England." When the British Museum took over his treasures in 1816, he received back only the larger half, 35,000 pence, of the expenditure incurred, but he enjoyed the satisfaction of having acquired works of art for his country, which soon drew countless artists and scholars from all corners of the continent as if on pilgrimage to England's capital.

Later, during the Greek War of Independence, Athens was again besieged, and a bombardment once again inflicted considerable damage on the temple. Fortunately, so much of the sculpture had been rescued by then. We now know of approximately 10 relatively intact statues of the façade groups, including the few pieces from other collections and those that remained in Athens or were later excavated from the rubble. Of the 92 metopes, several remain, but only 17 are still relatively intact; of the nearly 140-meter-long frieze, only a few relief plates are completely missing, and about half is still very well preserved. The arrangement and explanation of the found and of course, the remains are of great value, the reports and drawings of those who knew the Parthenon in better condition. It was a particularly fortunate coincidence that in 1674, thirteen years before that fateful bomb fell on the temple, the French ambassador to the Porte, the Marquis de Nointel, obtained permission from the commandant of the castle, in exchange for six yards of scarlet cloth and 25 pence for coffee, for the draftsman Jacques Carrey. Carrey acquitted himself of his task, especially considering that he was not allowed to make any statements and had only fourteen days, in an excellent manner in many respects.

A new era in the development of art seemed to have dawned after 1816. With a certain astonishment, one felt suddenly transported into an unknown world of beauty. A Goethe considered himself fortunate to have been able to experience this. People realized the enormous distance between the Greek works of later times, with which they had until now largely had to be satisfied, and these products of Greece's heyday. Perhaps nothing has more contributed to the triumph of the historical principle in archaeology than the discovery of these art treasures.

And even the contemplation of these Elgin marbles should have prompted a more in-depth historical study. One clearly senses that one is confronted here with the remains of a monumental art once destined to meet the noblest needs of the Attic people. In the façade groups and metopes, the mythological folk ideas of the Athenians found their highest expression; in the frieze, it saw itself in its holiest and happiest moments; it was Attic civilization, seen from one of its noblest aspects and as the Athenian himself loved it most, which, in its outward forms and spiritual mood, presented itself here in a grand scene. We too, when we dwell for a time amidst all these mighty creations of the human mind, are somewhat subjected to the same impressions as the Athenian must have received from them. But hand in hand with this goes the need for explanations, and we also want to bring these impressions to light by taking stock of them. We must get to know the Attic people, not only in their external circumstances, but above all in their life and aspirations, in their way of thinking and innermost soul. However, as soon as one attempts to clarify what a people was at a particular point in its history, one is naturally forced onto the

historical path. We too will embark on that path in this essay, following it from the beginning, not starting from the work of art, but returning to it repeatedly, only occasionally setting foot on it; to enter it for its own sake is the immediate goal. The Elgin Marbles provided the initial impetus for the following study, but the author will not concern himself with them for the time being. He will attempt to briefly present a history of the development of the Attic people—and, of course, also to some extent of Hellenism in general, for the two are inseparable—so that it may become clear how national Hellenic and Attic art arose in close connection with the entire development of the people and, as it were, grew up with the people. Our story naturally brings us back to Phidias and his works, where Hellenic art truly first matures.

We should begin with the general Hellenic; Attic is, of course, only a specific form of it.

We will briefly examine how Hellenic religion, and in close connection with it, Hellenic civilization as a whole, developed. The high significance of the religious element for the life of the Hellene in general and for the development of their art in particular, is not usually fully appreciated.

In the deep darkness of so-called prehistoric times, comparative mythology, alongside archaeology and comparative linguistics, sheds some bright rays of light. With its help, we can, for example, also form some idea of the nature-view, indeed the emotional state, of those Indo-European tribes—we will call them Pelasgians for convenience—whose Hellenic language and civilization later developed. Just as little as their kin, at a similar stage of civilization, were these pre-Hellenes masters of the overwhelming mass of impressions that pressed upon their receptive minds from all sides. They lived amidst a world of higher beings—wandering about on their own or dwelling in trees, stones, the wind, the clouds, heaven, and earth—from whom they knew neither what to fear nor what to hope. It was honorable to ascend the high fire altar and send up the sacrificial fragrance to Zeus, the being who sat there in the shining vault of heaven, seeming to encompass the scene of all change and transformation here below with an eternal equality. There, across that vault of heaven, a fiery light moved. To which being is it that one owes this nurturing warmth and bright radiance, which bring joy and confidence to the soul? A host of explanations arises, new or ones one has already given oneself many times, and imagining something and accepting it as true is the same thing, or rather, one does not yet distinguish between true and false. Many believe that it is undoubtedly the son of Zeus to whom one owes all this. But the divine being descends and disappears into the utter darkness of the far west. With what gloom and anxiety one is filled, what a multitude of images assail the mind once again. What has become of the glorious one? Does he sleep an eternal sleep and was he kissed by the moon goddess seen rising there at the transept? Does he no longer live and does he return from that West just as little as the shades of the deceased who have arrived there in the house of Hades? The horrors of death and the afterlife arise before the mind in all their force; has one perhaps also been tainted by bloodguilt, or has one offended one of the hundreds of invisible beings by which one is surrounded, in arrogance or entirely unknowingly? But redemption dawns from the east; streaks of light appear, followed by a rosy glow. What being plays there in the first twilight? Who is the glorious, the rosy-fingered one, whose appearance fills the soul with renewed hope? There rises the great being of light, whose coming one had already thought one might expect. Once again, the soul grasps for this explanation, that explanation. It is a radiant hero (Tithonos), for example, believed to be desired and embraced in love by the rosy-fingered one (Eos) herself as her consort, radiant with beauty and strength, yet one can already predict that, having descended to the west, he will live forever, without eternal youth, shrinking to a shadow of himself. It can also happen, however, that the glorious being of light suddenly disappears while shining high in the heavens. Numerous demonic beings roar and bellow through the heavens, dark figures appear on all sides. Zeus himself seems to have vanished for the moment. It is an attack of the powers of darkness on those of light. They are the Giants sprung from the earth; Hades also propels his terrifying minions upwards; The earth there in the west has split open, and from it rise those beings who have made it their inexorable task to spread despair and terror among mortals. The powers of death reign in the realm of life. There, the black Furies howl, chase, as they drive before them those laden with bloodguilt; is not Demeter, the goddess of the earth, herself an Fury, now mingling with her sisters in black form? They are under the command of the terrifying Persephassa, "the destroyer," who rushes forth with the Gorgon's head before her,

75550 whose gaze causes all who are struck to fall to the ground. But deliverance is near. Already Zeus's thunder resounds through all the shouting and wailing. The deity rises; with lightning in hand, he stands against every enemy. Or suddenly, his daughter Athena leaps, resplendent in armor, chariot and all, from her father's mind. She runs straight through her enemies; no one resists her. There, the Sun God casts his brilliant radiance through the black masses. A nurturing glow spreads throughout the entire sky. The powers of darkness retreat. The realm of life reigns once more. The Gorgon's head adorns Athena's chest like a trophy.

75560 Such were the images amidst which one lived. Their number was countless. Almost no natural phenomenon did not evoke one. They accumulated. Different individuals or tribes, or even the same ones in different times, often saw different events in the same phenomenon. What arose in the soul was not yet usually retained with full consciousness; it possessed only a small amount of fixed, enduring ideas, by which one was constantly, even involuntarily, dominated. The same image could recur incessantly, as an unconscious or semi-conscious memory, with a certain newness.

75565 Imagination still played a major role in these childlike souls. One could hardly conceive of anything but living beings in full activity, at a time when, for example, grammatical gender was used to divide material objects into men and women; and the mythical figures one envisioned were humans or animals, horses, cows, birds, or combinations of various animals or of animal and human. This animal world was that of the old Indo-European homeland, the same one later encounters on the oldest Greek vases, alongside the most easily imitated sea creatures (e.g., octopuses), which one encountered on the coasts or islands of the Greek archipelago, in the new homeland. Similar vases have come to light from all corners of Greece and the islands, on Rhodes, Santorino, Cyprus, etc., but above all through Schliemann's excavations at Mycenae.

75575 Had people already begun to depict the world of the gods? For a long time, that could not have been the case. Yet, from all parts of Greece and the islands, very old carved stones have come to light, undoubtedly representing an artistic practice that must have begun long before the rise of Hellenic civilization proper, and it is on them that one believes¹) to observe those unadulterated Indo-European depictions such as, for example, Erinnyes—horse-headed monsters with the bodies of birds or insects.

75580 A time, however, approached when the spirit gradually began to outgrow this old state of affairs. Peoples developed. By what causes? Primarily by no other means than what turns a seed into a tree, a boy into a man. Unbiased research has not yet progressed much beyond this explanation, which is not really an explanation at all. Geography, too, teaches us nothing more than the external circumstances that exerted a facilitative or counteractive influence on that development. Thus, like so many peoples before and after him, Pelasg, primarily through the inherent power of human nature, about which we know nothing further, transitioned into a new era of spiritual development: imagination is increasingly displaced from the all-pervading position it occupied in the soul; coherent, ordered thought claims ever greater space. Even amidst ancient mythological representations, one detects the influence of this transition. Alongside the Sun God, who died in the west, or slept, or languished in perpetual old age, people imagined an eternally youthful being of light, rising uninterruptedly above the horizon each morning with unchanging benevolence toward the human race. Here, they truly had the fruit of reflection, a kind of fixed theory to explain an incessantly recurring phenomenon. Such a being of light was, or apparently became, Apollo, and herein perhaps lies the beginning of the great significance this deity had for the entire development of the Hellenes: people now had some guarantee that the realm of darkness could never permanently overcome that of light; the ever-returning God of Light also became the regulator of the times. But of greater significance was the fact that the entire old mythological worldview had to recede more and more. People gained a greater understanding of the natural condition of things—of clouds and winds, for example—and thus the myths themselves lost their original natural meaning. Separated from natural phenomena, the mythical figures became entirely independent representations of the mind. They also acquired a more fixed form as, with the development of thought, they increasingly lost the character of momentary impressions.

75590 And something else went hand in hand with all this, which was equally far-reaching. The mass of ancient mythical representations was astonishing, but order was restored, not least in a way that, while by no means exclusive, was nevertheless peculiar to the ancient inhabitants of Greece and Italy. Myths were common representations within a certain circle; some were more so, others less so, and now, over time, within that circle, certain of these representations came to the fore, in a manner similar to how

75615 a language, formed from a mass of sounds that evoked roughly the same image, prefers
some without entirely rejecting others. Thus, here, generations and families chose
particular mythological beings as their gods, without this necessarily implying even
the slightest disdain for the others. Tribes and peoples did the same—undoubtedly
75620 because the ruling families made their gods into those of the people—and in this way,
certain mythical beings acquired the standard that is usually accorded explicit
recognition in certain circles. A somewhat fixed system of national gods was
acquired, to which one knew one had to adhere above all. With the development of the
state, stability was found not only in the conditions of life, but even in the world
of thoughts and feelings. And with this went something that entirely testified to the
75625 same spirit. Whereas in the past people often did not know how to appease a hostile
deity and, in desperation, tried this or that sacrifice or exorcism, a certain kind
of solid science gradually developed in this regard. The aristocratic families who
founded the states and then usually gave them their own gods, whom they had long
known from experience, naturally knew best what had to be done to remain in harmony
75630 with them. They knew the "divine things, were the interpreters of divine law and
sacred ordinances," and on this, often for centuries, much of their rule rested with
their fellow countrymen. But gradually, that ancient separation between the gods of
light and darkness acquired a very special significance among the Pelasgian tribes,
and it is here that the clear development of the specifically Hellenic begins. It was
75635 a period of ferment and development, which, as elsewhere, for example, in Europe
during the time of the Norsemen, preceded the establishment of settled conditions in
Greece as well. Peoples departed to choose new abodes. Tribes and families, guided by
their gods, entrusted themselves to the vast sea, directing their impetuous power now
here, now elsewhere, or permanently establishing themselves as lords and masters in a
75640 given country. Egyptian historical tradition has known these movements since the
fourteenth century, and only in the eleventh century, with the Dorian migration and
the subsequent colonizations, did the end arrive. How could the highly civilized
Egyptian have suspected that among those wild peoples who infested his seas, a
civilization was sprouting that would later become too powerful for him? It was a
75645 thirst for action that drove them from their homes; they no longer felt so passive in
the face of what surrounded them; having gained a firmer footing with the spirit
world around them and having entered into a close relationship with some of them as
their special guides, they were freed from overwhelming external pressure and entered
the world with a newly awakened sense of their own power. Yet, at the same time, the
75650 contrast between the Gods of light and darkness pressed ever more powerfully upon
their minds. On the one hand, they imagined the powers of the underworld, Hades,
where the shades of the dead led a desolate existence, the terrible Persephassa, the
Erinnyes, who in blind rage chase the blood-guilty one before them—onward, onward,
ever onward—to cling to him, to suck his blood, to let him live, but to consume him
75655 alive—beings without reason or human feeling. The thought of all this paralyzed their
powers once again. Fortunately, however, they were countered by the Gods of Light:
Apollo, the glorious God of Light, by whose nurturing radiance one lived with full
soul without disturbing afterthoughts, or Athena, the powerful feminine being of
light, daughter of Zeus, who triumphed over the powers of darkness. Here one gains
75660 insight into the motives that contributed to the choice of Gods. Which one will one
align with? The deepest inclinations of the soul toward the mysterious, the most
intimate sense of moral responsibility for one's actions, speak for the powers of
darkness. But against this rises that tremendously effervescent life force, which
makes the bosom rise with the bliss of existence, which must enjoy and must act,
75665 which is completely captivated by the present. Its urge proves irresistible. "Hades
one wants to forget"; one turns to the Gods of light. With a certain degree of
consciousness, a people here chose a direction in life; the path is taken on which
one will achieve one's entire further development; the dawn of Hellenic civilization
has broken.

75670 Apollo became, first and foremost, the deity who met the needs of the soul that were
now especially felt. He, the God of Light, became the one who wrested their prey from
the powers of darkness, who freed the poor suppliant from the weight of bloodguilt
through purification and atonement, and, as it were, restored him to life. He averted
all destruction and triumphed over disease. While the distressed soul had of old
75675 turned to the divine beings themselves for guidance in the midst of all the
uncertainty that surrounded it, to whose oracle one felt more drawn than to that of
the kindly God of Light, whose delight it was to spread blessings, with whom one knew
one would find a sympathetic heart, whom one could approach with so much more
boldness than the so awesome Zeus? With what rapture of soul did they sing to him
75680 their Paian, the eternally youthful one, through whom all creation seemed to truly

feel the joy of existence for the first time, that profound delight in life, where songs naturally rise from the chest, just as the Deity led the way in song and music, lyre in hand, followed by the Muses. Thus the Sun God became a god of purification and noble joy of life, and he became so to such a degree that his original

75685 significance faded completely into the background. However, there was still enough myth-creating power to establish a new being of light, Helios (the sun), in the vacant place. It was an event significant in its consequences when—this occurred already in distant times—a temple and oracle of Apollo were established at Delphi, probably on the site of an earlier sanctuary. Yet, this new spiritual direction also

75690 holds great appeal for Athena, the exalted daughter of Zeus. In her person, one begins to recognize oneself in his noblest aspirations. It was she to whom the father entrusted his lightning; before her fled the powers of darkness, the Giants, the sons of the Earth; she triumphs through bravery and strength; she, the eternal virgin, unclouded in mind, without desires, keeps her eye fixed unwaveringly on the

75695 fulfillment of her task. There is a zest for work, a self-satisfaction through exertion—that feeling which those warlike tribes and families so abundantly enjoyed when their homeland became too small for their deeds. It was of this bold desire for action that Athena became the divine example, and according to Homer, "war was at the heart of men," "the distaff and the loom to women." [1] Here too, serious effort was

75700 possible; here too, the Deity took precedence (Ergane). But after the arduous endeavor comes the glorious satisfaction of having achieved the goal of the effort, the bliss of the victor. And this too was a gift from the Deity. From her, as from her formidable father, descended Nike, the Goddess of Victory.

75705 What else is it that appears before us here than the Hellene in his peculiar state of mind and striving? New life had been infused into those old mythical figures, which had remained in the soul after the retreat of natural meaning, and indeed that same new life that one felt awakening within oneself. Some gods, such as those mentioned, were, by their original meaning, more suited than others to absorb such a new content; in general, however, the world of the gods increasingly became the epitome

75710 of that of humans, as they perceived it sensually and came to know it through interaction, not least as they experienced their inner soul sensations in their own minds. This is truly not particularly Hellenic. Where is or isn't the Deity presented more or less humanly? Yet perhaps nowhere do we see this to such a degree as here, among the Hellenic peoples. People had turned to the gods of light because they

75715 wished to free themselves from all oppressive feelings of fear and uncertainty. With a calm, free soul, they wanted to approach the Deity, and they succeeded all the more successfully the more they made it conform to themselves. The mixed forms of animal and human, which often came to mind at the mention of a divine name in the past, became increasingly human. The horse-men (centaurs) and certain winged beings (Eros,

75720 etc.) were ultimately the only things left of the old ideas. From ancient times, the mythical figures were both active and passive beings; their sexual intercourse, in particular, often provided the solution to numerous questions concerning the universe and its phenomena. Where does the sun come from, for example? From the mating, for example, of the shining Vault of Heaven (Zeus) and Darkness (Kaluke). These, however,

75725 were more or less mere notions of the moment; several entirely independent explanations could be given for the same phenomenon. Drawing conclusions was not considered. Now, however, was the time for it. The myths are linked together. One is struck by the fact that one and the same divine being now mates with one, then with the other; that he mates with someone, for example, who has also been known as his

75730 mother or sister; that the deity defeated by another is actually his father, etc., etc. The gods are tainted by fornication, incest, and parricide! One thinks one observes a certain reluctance to draw such conclusions in the Vedas. It is undoubted that they were not shunned in the least among the Greeks, that they were even explored with a certain predilection, and that nowhere does the world of the gods

75735 find such a perfect partnership.

The habit of people with human vicissitudes, passions, virtues, and vices became like theirs. In the time of Homer's poems, it was completely so. Without these clearly

75740 defined human divine figures, later Greek art is unthinkable; only a mythology that was so highly a reflection of human life could provide the material for a literature like Greek in its highest development. Yet, the intensity of the worship of God certainly suffered as a result. Moreover, compared to such divine beings, the mysterious and symbolic could only occupy a modest place. Among numerous ancient

75745 peoples, not least among the Bactrians and Indians, so closely related to the Greeks, the veneration of a single supreme being also managed to break through into popular religion. Among the Greeks, only a few faint traces of this remain. How completely

different would the Greek people have developed if, when they envisioned the gods of life and death as two separate groups, they had chosen the latter instead of the former? Not only would the emotional state have remained more suited to conceptions of a more-than-human divine being, but on Greek soil, a form of religion focused on the afterlife would have developed, which would have shared some striking characteristics, for example, with Catholicism. And this rests on more than mere speculation. For we have pointed out that in the choice between mythical figures, which plays such a role in the development of that ancient religion, those who did not come to the fore were not, therefore, entirely abandoned. This is nowhere more evident than here. The gods of light retained great dominance; they primarily governed life. Yet the right to these other religious sentiments was also fully recognized, so much so that certain institutions were created, the Mysteries of Demeter, in which they were cultivated; these, like all other religious rites, were a matter for the state. They were for "initiates"; but not only was it a very common practice to be initiated, but any understanding that one form of religion excluded another was lacking. Different institutions were simply created for the various needs that people felt awakened within them. Thus, the Mysteries became the place for the sense of the incomprehensible and the awareness of moral responsibility for one's actions with a view to the afterlife. The symbolism and mystery of certain sacred displays and of the elaborate ceremonies there brought the mind into a silent, sacred mood; one sank into the holiest sensations: one had beheld the divine itself, and thus one felt more clearly than ever that one could never fully perceive it. By undergoing initiation, one could cherish the hope of finding favor with the gods of the underworld after death. Don't we involuntarily think of those converts from early Christianity who were baptized on their deathbeds when we read of someone who believed they had to be especially careful to be initiated before their death?1) Thus, the mysteries clearly demonstrate that the Greeks also harbored the seeds of another religious development.

However, it wasn't only in a particular form of religious veneration that the gods of darkness were recognized and honored; they also continue to occupy a significant place in general religious tradition. There, they certainly experienced the profound influence of the gods of light. In their regard, too, people wanted to free the soul as much as possible from all fear. With the Erinnye-Demeter, this wasn't difficult; she was the ancient, beneficent goddess of agriculture. In the interior of Arcadia, the land where the new spirit had the hardest time penetrating, people long retained the memory of the "black Erinnye-Demeter" with a horse's head entwined with snakes, but generally speaking, this deity too soon came to be considered entirely human. Her terrifying sisters, the Erinnyes, were eventually also greeted as Eumenides, "the benevolent ones," or altars were erected for them—the unreasonably vengeful ones of old—as the "Semnai," the goddesses of sacred seriousness, the upholders of a moral world order. This was never entirely successful; the Erinnyes remained, alongside Semnai and Eumenides; their figures never assumed a completely fixed form, least of all a friendly and human one; people shuddered at the mention of her name; they feared, in some way or another, even without intending to do so. In the case of blood guilt especially, the oldest offense known to human society, it was as if these were truly ancient horrors from the underworld broken loose.

This fear of the Erinnyes kept alive the idea of a mysterious divine power at work among the gods, who were increasingly descending to the ordinary human level. This fear, however, also persisted in other ways; the human mind, especially then, often harbored the most contradictory ideas without any hesitation. Moira (fate), an inexorable power, which, according to Greek folk belief, was half and half independent of the gods, always had something very supernatural about it. Likewise, atê (ἀτή), the destruction that the gods send to humans, which suddenly clouded the mind, which struck when unexpected, fell completely outside the ordinary human realm. This too, like so many ancient representations, had something of a person, and had it, like other abstract concepts such as persuasion, Peitho, become a clearly defined human figure in the Greek way, then this divine exercise of power would also have come entirely within the sphere of the human, and Atê would have become a messenger or helper of this or that deity, probably of Zeus, just as Peitho, for example, is one of Aphrodite. A principle of such a complete personalization reveals itself in the Homeric hymns; however, this was not pursued further. More generally, numerous ancient folk tales, concerning the unexpected way in which the gods caused human arrogance to fall, concerning people who sought to evade divine decrees but thereby fulfilled them, etc., preserved a fairly lively sense of a divine power whose ways differ from those of humans. Thus, there was still some counterbalance to the complete incarnation of the Deity, and that this exerted an ennobling influence even

on the purest Hellenism, we will see later.

And besides all this, the Deity of worship was undoubtedly not quite the same as that of mythology. The gods of natural phenomena had become mythical figures, but the divine beings could also reside in inanimate objects (fetishes), often blocks of wood, and from there exert their magical power. The oldest Greek idols were such blocks of wood (ξύανα), dwellings of the Deity, half and half the Deity himself. These often acquired a human form to some extent, now more or less, but in the perception of those who venerated them, they never fully became an actual image; one was always primarily impressed by the incomprehensibility of divine miraculous power. The religious acts were prayer and sacrifice; Votive offerings, so common among the Greeks, were originally little more than sacrifices; in connection with these, other forms of worship developed in later times, as we shall see. Among the Indians, the sacrificial fire, the sacrificial drink, and the power of prayer itself were divine powers that, above all, sustained the world; through meticulous observance of an incredibly developed ritual of prayers, sacred incantations, and sacrifices, the Brahmin, as it were, held the universe in order. Among the Greeks and Romans, such immoderate exaggeration is not to be found; yet the philosophy underlying their religious practices is entirely the same; only, as might be expected, prayer and sacrifice here sustain "families and the state" more than the world in general. This high significance of sacrifice is particularly evident, for example, in the sacred fire of Hestia among the Greeks, and even more so in that of Vesta among the Romans. If that were extinguished, then the very existence of the state seemed to be jeopardized. What punishment did the Vestal Virgin deserve, whose negligence was to blame? Among the Greeks, as noted above, it was often the nobility who were expected to know the sacrifices required in all cases (we did not speak of the Romans, but it was not much different there); one now realizes more clearly how great the prestige they owed to this must have been. In Greece, as in Brahmin India, orthodoxy—actually, even that word is inappropriate here—consisted much more in ceremonial strictness, in "offering and praying"¹) than in faithful adherence to religious tenets; although, of course, this whole matter plays an infinitely more modest role for the Greek than for the Indian. It seems undoubted that the Greek, in his sacrifice and prayer, was dominated by ideas which he had already brought in embryo from his homeland common to the Indians and the other Indo-European tribes. Just as the old idols were imbued with those old religious practices, which one still feels attached to, some magical power was attributed to them, the idea of a miraculous deity was alive. Later, many people completely dulled all sense of the significance of these ancient actions. Such ideas of a more or less magical deity were, in themselves, no more sublime than those of simply human deities, but they kept the mind open to the mysterious and allowed for more exalted concepts much more easily.

People were not too attached, especially where the ancient world is concerned, to a distinction between religious and less religious peoples. Nearly all ancient peoples are primarily religious, although the religious ideas of one people are certainly much closer to ours than those of another. This is also very true of the Greeks. Perhaps nowhere did religion dominate life more completely than here. After the birth of a child, many ceremonies and sacrifices; During the annual festival of the Apaturia, the newborns of the past year were also received into the phratry, a community of citizens, through sacrifices; religious festivities, in Athens and elsewhere, marked the end of childhood for boys and girls, with the boy being received among the Ephebi (young men), the girl being dedicated to Artemis; the solemnization of marriage was also primarily a religious ceremony, no less so than the funeral and burial of the deceased. Here, religion, like the Catholic Church, accompanied man from birth to the grave. Yet, even beyond all established customs, the Greek lived, as it were, with his deity. No hope or fear, no joy or sorrow, did not share it. Everywhere, too, she was so close to him. For each of his needs, he found a divine being to whom he could pray for relief; Along the roads of a "pious land"¹), such as Attica, one saw with every step, as it were, a sacred place, an altar, a statue, a temple, where the nearness of the Deity was felt more vividly. And wasn't there still something left of that ancient creative force from the time of unhindered myth-making, when no nascent state yet established specific forms of the gods, when divine beings were heard in the rustling of the trees and the murmur of the streams; when one repeatedly saw the same forms of the gods with a certain surprise of newness, like the gods of Olympus, born from their father's head; when mythical beings, as it were, arose and disappeared simultaneously with the sensations that gave them being? Not only could one still populate the forests with satyrs, the streams and rivers with nymphs and river gods, almost to one's heart's content, outside the more official pantheon, but even that pantheon itself was in no great

danger of fossilizing into figures whose names no longer resonated with the mind. One
 75880 could easily find a satisfactory expression for each of these gods, and if one didn't
 find one, the gods appeared in numerous capacities, outgrowths of their mythical
 origins or oldest moral meaning—for example, Apollo the rejecter, averter of evil,
 soothsayer, etc.—well, what prevented one from continuing in that direction and
 75885 linking the representations for which one sought a mythical personification to one of
 the existing god types, whose character, more or less beautiful, often barely
 warranted a separate epithet? Thus the gods acquire special titles for these legions.
 Thus, to name a few examples from the vast majority, Athens became a champion of the
 city (πόρομαχος), a goddess of the council and popular assembly (βουλαία, ἀγοράία),
 and of knightly games (ἱππία); yet tradition also relates that Diomedes, after a
 75890 violent storm, founded a temple for her at Mothone under the new name of Goddess of
 the Winds (ἀνεμωτίς). She undoubtedly was anything but this originally. The gods
 repeatedly encroach upon each other's domain, and indeed, something of a sense of the
 universal divine asserts itself here. The high significance of religion for political
 life has already been noted. Families, lineages, and subdivisions of the state, like
 75895 the Greeks themselves, had their own gods and cults. When the first major attempt was
 made from Delphi to unite various Greek states into a single entity—when the Delphic
 Amphictyonic League was founded—a system of twelve gods had to be devised, through
 whose union they could join forces. It was utterly impossible for the Greeks to
 75900 imagine a state without religion, and as long as the Greek states existed, no more
 important matters of state were known than the organization of religious festivals
 and the erection of temples, the making of statues and the like. All opposition
 between the spiritual and the secular, by which one particularly understands the
 political, was completely alien to the mind of the Greek.¹⁾ Separation, discord
 75905 between church and state, has only really existed in our civilized world, at least in
 its true sense, since Christianity emerged entirely independently in the Roman Empire
 and only reluctantly conformed to the forms of that empire.
 No wonder that the influence of its religion can be discerned to a high degree in the
 entire development of such a people. We know the spiritual direction associated with
 the worship of the gods of light. The Greek walked about the world with his head held
 75910 high; he was convinced that he had a place to occupy, that he had to be something in
 his own right. His religion also accustomed him least of all to the idea of a power,
 before which he, as it were, sank into insignificance. "Gods, heroes, men"²⁾, was
 this indeed only a difference of degree, not of essence? The Egyptian, Babylonian,
 Assyrian, who could completely efface themselves before their gods, could also do so
 75915 much more easily before their rulers. When the migrations of peoples ceased in
 Greece, when thus the period of formation mentioned above had ended, republics were
 established everywhere. The East was and remained the land of divine kingship. In the
 Egyptian king lived the Godhead. With words of reverent admiration, with which an
 Indo-European people would, for example, glorify the mighty resurrection of the solar
 75920 hero, the king is greeted in Egyptian texts when he rises to fight his enemies¹⁾;
 already at least 1,500 years before Christ, the Babylonian king boasts that the gods
 have "given him dominion over the peoples, that they have placed their heavenly
 weapons in his hands"²⁾. For the Greeks, not the individual's droit divin, but the
 entire community of family or state, as we have seen, bore a divine character. This
 75925 was, indeed, the great force that held them together, alongside which, however,
 developed the so-called aesthetic concept of a harmonious union of free individuals
 through legal organization (εὐνομία). How different among the similarly related
 Germanic peoples, where the same sense of individuality all too severely hampered the
 vigorous development of the state.
 75930 That a noble joy of life permeated the soul of the people of Apollo, that round
 dances, music, song, and poetry became the highest necessities of life there, is only
 natural. Even though the peoples had become calm, something of the old thirst for
 action still remained; exertion demanded the fresh vitality. Racecourses and
 75935 wrestling grounds, gymnasiums, and palaces sprang up everywhere, where people could
 constantly demonstrate their courage and exercise their strength, even outside of
 war. In all their efforts and enjoyments, they felt a profound need for one another.
 What delighted the soul was all the more so when they could share their joy with
 others, and what they knew they were capable of, whether on the gymnasium grounds or
 in string music, song, or poetry, they felt the most lively need to see validated by
 75940 universal recognition, making it, as it were, a possession. Gymnastic and musical
 competitions were the order of the day, and generally, the Greeks surrendered without
 restraint to the truly human urge to distinguish themselves among their fellow human
 beings (φιλονομία). In the powerful self-esteem that flowed through the breast here,
 it was the human being that one respected within himself, but the human being as a

75945 whole, in his noble form, his aspirations, his powers, his inclinations, just as the
 Gods were, after all, his sublime image. There was no room here for disparaging the
 body as a bearer of baser desires. One felt the deepest obligation to maintain and
 develop all that was noble one was conscious of possessing, and this feeling applied
 75950 not least to the body, for which one was highly proud. This, too, gave gymnastics
 such high significance; bathing and anointing were a matter of great importance;
 health and strength were almost nowhere so valued as here. Whatever admiration
 physical beauty inspired; no covering, however slight, could obscure the body of the
 wrestling or running youth in any way. And while one generally felt oneself as a
 75955 human being and in every human inclination in closer connection with the Deity, this
 was especially the case with the passion of love. With a fire and fervor reminiscent
 of a Hebrew poet, Sappho implores the goddess of love, Aphrodite, 'not to bind her
 soul under a yoke to press down suffering'2), but to descend in all glory and 'with a
 smile on the divine face to ask her what she suffers and why she calls upon her.'
 'Whom do you want me to bring to you in love, who, Sappho, has done you harm?'
 75960 Already the poetess feels, as it were, the immediate presence of the Deity; with
 powerful assurances, it promises her its help. - Was it any wonder that this passion
 was admitted without any reservation? How overwhelmingly its power is revealed in
 another song by the same poetess1): 'that man seems to me like the Gods, who sits
 there opposite you and speaks to you sweetly in your presence, enchanting in his
 75965 laughter; my heart races through my bosom; My tongue is speechless, suddenly I glow
 over my body, I see nothing, the sounds whistle past my ears, a shudder comes over
 me,' etc. However, one also knew the deep melancholy of love2), or the lovely and
 sweet, as for example Alcaios3) wants to add something to his 'violet-plaiting, pure,
 sweet-smiling Sappho, but shyness holds him back.' Passion was lived through in all
 75970 its nuances. Undoubtedly the Greeks here made just as good a distinction between the
 permissible and the impermissible as any people who has reached even the slightest
 degree of civilization, but what naturally could not take root here was the idea that
 in the name of religion one had to impose restrictions on the demands and
 inclinations of one's human nature, although undoubtedly the beginnings of asceticism
 75975 are evident in the mysteries during a certain period of Lent. The boundaries of what
 was permissible were drawn rather broadly and vaguely, and they were crossed without
 much qualm. On the other hand, there was a clear sense that, within passion itself,
 one must uphold one's dignity as a human being. Within the realm of what was
 permitted there fell even the most repulsive associations we find today, and yet even
 75980 the most impure passion was often, as it were, entirely interwoven with the most
 exquisite feelings of sympathy and friendship.
 In general, among the Greeks, passion more often than elsewhere arose from
 enthusiastic admiration of truly human beauty, so that spiritual sympathies, feelings
 of tenderness, and sensual inclinations followed rather than preceded it. No wonder,
 75985 then, that feminine beauty was known there in every manifestation and every shade. No
 less, however, was there an open eye for the splendor of the pristine male body, for
 the sweetness that is often inherent in the blossoming boy; One felt oneself
 completely pulsated with enthusiasm as the handsome youth trotted victoriously across
 the racecourse, the sense of triumph seeming to imbue him with every movement. From
 75990 one gymnastics training ground to the next, one enjoyed the sight of these shapely
 boys in a thousand poses and a thousand different groupings; many a beautiful image
 on vases still conveys the feeling with which one was inspired. The allure of
 masculine beauty stood in stark contrast to that of feminine beauty. In the same way
 that the name of a beautiful girl was often written on walls and partitions, the
 75995 artists who painted the vases often let almost no work leave their hands without
 brushing on it the words: "This or that (boy's name) is beautiful"—the most common
 vase inscription. Likewise, Phidias was said to have placed the name of his chosen
 young friend on the finger of one of his gods' statues, using the same formula
 "Pantarkes is beautiful." Among the reliefs on the throne of Olympian Zeus, one found
 76000 the same youth who had won a victory at Olympia—what a stroke of luck for the artist!
 —tying the band that was to support the victory wreath around his head. The
 freestanding statues Phidias created were almost exclusively of immortal gods;
 however, among the very few of humans—it was even believed to be the only one—the
 same Pantarkes also appears as the victor. Compare this, for example, with the
 76005 predilection with which Rubens and Rembrandt depicted their women individually or in
 larger compositions, and similar works. Among the ancients, Elpinike, Kimon's
 beautiful sister, appeared in a painting by Polygnotus, and for Praxiteles, his
 hetary Phryne was a favorite model.
 Sensual charm sharpened the eye for human beauty. It is encouraging to note that
 76010 although the Greek threw himself almost unreservedly into the broadest stream of

sensuality, his noble human nature was not destroyed. All the same, the more one penetrates ancient civilization, the more deeply one realizes the colossal task Christianity later had to fulfill there with its asceticism.

76015 On this general foundation, the unique Hellenic civilization emerged. From which people did this development originate? The principal so-called Hellenic tribes are the Dorians and Ionians, but the beginning of the movement is most likely to be found on the southern islands, especially Crete. The Greeks themselves also had some idea of it. According to tradition, it was Cretans who founded the sanctuary of Apollo at Delphi; the mythical origin of art with Daedalus brings us to the same island; even in unnatural passion, the Hellene considered the Cretans his predecessors. In more historical times, however, after the Dorian migration (c. 1100), the development of Greece for centuries rested primarily on the Dorian and Aetolian tribes, who had then settled in the Peloponnese. There existed, to a great extent, the power that could create and maintain states, but there also existed a noble sense of self-worth, which exuded freedom and demanded action. There, one learned to strive for male virtue, not for material gain but for its own sake; the highest national idea, the unity of all Hellenes against the barbarians, was especially cherished there. For centuries, the soul of those who aspired to the higher was directed toward Sparta and Olympia. 2) Otherwise, the Ionian and Aeolian developed on the islands and coasts of Greece and Asia Minor. Here, there was no such dominant ideal aspiration, which gives the soul a definite direction and always confines it, to a greater or lesser extent, within a fixed circle of ideas and feelings. The Aeolian and Ionian were more inclined to surrender themselves unreservedly to every impulse of life. Uninhibitedly, they opened their senses and mind to all impressions and sensations from outside. The most diverse moods took possession of him in turn; he knew the most enthusiastic enjoyment and the deepest melancholy; exuberant joy and exuberant sorrow. Nowhere in Greece were the sounds of song and string music, or the tripping beat of the round dances, heard more frequently; yet nowhere, too, was such a wild outcry of mourning found at the corpses of beloved departed ones: wild cries pierced the air; people beat their chests with violent blows; they tore their clothes or wallowed in the mud. Here passions glowed and seethed; that of love manifested itself here above all in its unbridled natural force. Here, too, a powerful desire for action and a noble striving for masculine virtue prevailed; however, more easily than among the Dorians, people here fell back into the comfortable pleasures of life. They certainly did not shy away from the most strenuous exertion, but gladly surrendered themselves to every inclination of the moment. The carefree continuation of life, without binding oneself or allowing others to bind them, held the greatest appeal here. Naturally, however, the soil here was very suitable for every new endeavor. Directions were taken that could certainly be considered alongside those of Sparta and Olympia. Maritime traffic always exerts a great influence, and this was bound to be especially true here. Especially since, also after the Dorian migration, colonists from the Greek peninsula settled on the islands and the west coast of Asia Minor, much life and activity began to prevail there. Trade developed, and contacts were established with Asian states, especially Lydia. Along this path, Babylonian weights and measures were learned; pre-weighed pieces of precious metal were used as a means of exchange, following the Lydian example; in the Ionian cities on the west coast of Asia Minor, all trade began to rely on the use of actual money, minted by the cities and therefore of completely reliable value. This was one of those innovations that, due to its all too obvious utility, was destined to triumph within a short time. It also made itself felt in the Peloponnese. A global trade arose not only among the Ionians and Aeolians, but also in Corinth, Sicyon, Megara, Argos, and Aegina. It was an invention for social development no less significant than that of steam and electricity in our day. In ancient times, the Greek was primarily agriculturist. Under the authority of the nobility, they lived in the countryside in the same environment, so that no ideas of change arose in them. As already noted, the Greeks felt that state and society rested on divine institution. Naturally, it was easier for the colonist to be freed from the power of old traditions. Moreover, the suddenly established new states on the Asia Minor coast were naturally lighter in structure than those that had gradually emerged on the mainland over the centuries. This republican order was very easily established here.

76075 The weight of the situation, which, as noted above, permeated Greece after the Dorian migration, overshadowed royal authority. However, the once-awakened republican self-esteem could easily go further, and the shocks that the ancient tradition had received ultimately undermined the prestige of the nobility, the upholders of divine

decrees. The sea voyages made the souls of the Ionians and Aeolian more susceptible than ever to new impressions, but what is especially significant is that the new world trade completely reversed social relations. Trade and commerce became sources of wealth more than agriculture; the nobles participated in this, but alongside them also the people of lower classes.

These not only emerged from the circle of patriarchal subservience of rural life, but also placed themselves alongside the ancient lineages with wealth and influence. Revolution after revolution broke out. States like the Ionian and Aeolian were naturally not strong or flexible enough to absorb new principles like these and remain firmly grounded, or even to gain new strength. And indeed, even the mobile, irritable Ionians and Aeolian lacked the self-control and perseverance in one direction that were especially required here. It was as unstable in their own souls as in state and society. People often felt anxiously tossed to and fro; "the waves—to use the image with which the Aeolian poet Alcaios described the situation—rise on either side of the ship, the storm howls; water has penetrated the bottom, the sails are torn"—one might add, however, that the crew was also lacking, who, under such circumstances, are the only ones capable of steering the ship into a safe harbor.

Meanwhile, the Lydians also sought to extend their rule over the Greek cities on the coast of Asia Minor. It fell to the Aeolian and Ionian to lead the first Hellenic war of liberation against the barbarians. How they lived in grandiose ideas! It was as if one were witnessing once again with one's own eyes the heroic deeds of their semi-divine ancestors, Achilles and Ajax. What a noble enthusiasm that freedom inspired, now that one had to risk one's life for it! Yet, one also readily lent one's ear to the calculating mind. Did it really make such a difference whether one joined the Lydians or remained on one's own? The Lydian, after all, had a strong love for all things Hellenic, he revered the Hellenic gods and consulted their oracles; one might almost say that by allying oneself with them, Hellenism was actually expanded rather than contracted. Now, his strictly monarchical disposition was certainly not entirely in keeping with the Hellenic way of thinking and feeling; but couldn't one be incorporated into the great Lydian empire and still enjoy all the real advantages of urban independence? Indeed, now that one had learned the power of an easy medium of exchange, wasn't there also considerable advantage in establishing close ties with a state that commanded such a supply of precious metal? These grounds truly had a considerable right. However, they were the grounds on which, at all times, material interest and submission to the supposedly inevitable were recommended as opposed to the ideal.

The coastal regions bowed their heads. They lacked the inner harmony and mutual connection that would have been necessary for the success of their endeavors. More and more, however, it became clear that a close identification with the East, even where one was not subject to the Lydian, indeed endangered the Hellene, that the noblest fervor of his soul would be extinguished, and that he would no longer be able to maintain even freedom, the most glorious good he knew. The internal turmoil already made it necessary for a man with unlimited power to occasionally emerge to restore peace and legal certainty to the state. Ambitious noble families set themselves up to assume princely authority, which, after all, they believed, perhaps sincerely and certainly not without reason, was also in the interest of their fatherland. In a Lydian word, it is believed, they called themselves tyrants. Many readily accepted this. Even under such rulers, after all, all that was beautiful and glorious that life offered could be preserved, indeed promoted; even a moderate liberty would undoubtedly be truly possible under their auspices. So, once again, it's all a matter of arguing for the practical against the ideal. Tyrants also appear in the Peloponnese, especially due to the influence of the Ionian population there, subject to the Dorians, who, with the help of such a tyrant, rebelled against the Dorians.

The aristocracies he hoped to assert themselves; namely, in Argos, Megara, Corinth, and Sicyon. Here, however, Dorian idealism emerges in its full force. Sparta becomes the arch-enemy of the tyrants. One owes it to the Dorians that, in this era, the divine spark of idealism in the soul of the Hellene was not extinguished.

In general, the Hellenic disposition develops more broadly in the Ionian and Aeolian than in the Dorian; however, there again, the strength that knows how to establish and sustain was lacking. The people in whom the full Hellenic life would be able to unfold without losing its foundation—one that would also do justice to all the tendencies of human nature, but would know how to ennoble them by controlling them—namely, the people of the Athenians—was still only just emerging. Let us now examine

its development, again beginning from the earliest times.

76145 The Attic peninsula, a region approximately 1,000,000 inhabitants, was already early
on—in that era of maritime expeditions and colonizations—where, however, several
Phoenician, but especially Asian Minor, settlements had established themselves. The
bond of family, as is usual among semi-developed peoples, held particular
76150 significance. Here, too, extended lineages, each, as it were, formed a world unto
itself. A common semi-divine progenitor was venerated, although the original family
bond had probably already very early extended beyond actual relatives. Here, as
elsewhere, the deep sense of mutual responsibility led to the duty of blood revenge
for the murdered member of the family; marriages, births, the reception of boys into
the circle of men, were matters of common concern; those united in life were also
76155 united in death: each family had its own burial place. It has already been noted that
the Greek-Italian tribes, in particular, regarded human unions as based on divine
decrees. This was especially true of the ancient inhabitants of Attica. Nowhere was
that feeling of nameless anguish more acute when, through intentional or involuntary
violation of these decrees, the moral world was, as it were, torn apart and the
76160 Erinnye had broken free; nowhere was a deeper need felt for purification ceremonies
and the world-restorative power of sacrifice. It has also been noted how the Erinnye
exerted themselves especially in cases of bloodguilt, and the ancient regulations
regarding this matter were primarily considered to be among those divine decrees. In
Attica, and undoubtedly elsewhere as well, though very clearly here, this had been
76165 developed into the idea that the divine constitution of society was endangered by
every shedding of blood, even the most innocent. Thus, not only was blood vengeance
here largely a sacred duty to the community to which one belonged, but also that
which wounded or killed without intent or law—probably even the blood avenger
himself, who had indeed fulfilled a sacred duty—had to be rendered harmless to that
76170 community through purification or banishment. The awareness of being bound by a
higher bond in one's family was also very vivid here; the communal sacrificial
ceremonies, in which this feeling was strongly fostered, were considered of great
importance. Just as ancient Germanic families took under their protection less
fortunate people, without considering them to be relatives, the Attic families
76175 similarly had a following of less privileged individuals, connected to the family
through participation in these sacrificial ceremonies, thus through religious ties
(orgeons).

In Attica, too, as so often happens, the actual state developed primarily out of the
76180 need for collective national defense; the plundering, especially of the wild pirates,
necessitated cooperation. Political centers were established in numerous fortresses
established by powerful families, behind which they could take refuge. Soon, the so-
called Erechthids, a family that venerated Athena and had established its fortress
and sanctuary of that deity on a steep rock in the center of the country, acquired a
76185 kind of sovereignty. Later tradition named the mythical Cecrops as its founder.
It was a weak rule that was established as a result, the hegemony of a king over
almost independent dukes. The internal wars, probably not uncommon in the past, did
not cease entirely. The powerful Eumolpids of Eleusis not only refused to submit to
any overlordship, but, eager for supremacy, even attempted to establish themselves on
76190 the rock of Athene

to establish the worship of their god Poseidon. After a tremendous effort, the sons
of Erechtheus were victorious, though apparently some concessions had to be made to
the opponent, and henceforth, alongside the chief goddess Athena, certain honor was
76195 accorded to Poseidon-Erechtheus. In later times, legend recounted a struggle between
Athena and Poseidon over the rule of the Attic land, which ended with the former's
victory. Still—we are still more than a thousand years removed from the beginning of
our era—the Ionian and Carian tyrants, from whom so much suffering had been suffered,
still roamed the eastern seas. They had even occupied the nearest Euboea and were
76200 constantly at hand from there. Even among these wild wanderers, however, a need for
organization arose, which was otherwise more characteristic of the Dorians; Perhaps
connections with the Apollo sanctuary at Delphi aroused this need among the Ionians.
Be that as it may, Delos became a common religious and national center for the
Ionians of the islands and the Asian west coast. Just as in the 10th and 11th
76205 centuries AD many Norsemen felt deeply influenced by the ecclesiastical and chivalric
ideas of that time, so too do we see Ionians today acting as representatives of
higher political and religious principles. How often does it also happen that savage
tribes settle in a land that had hitherto been the target of their attacks and then

defend it against others? Directly opposite Euboea, an entire colony of Ionians
76210 settled in the Attic lands; they founded a state there, the tetracity of Marathon and
Oinu, which maintained constant contact with Delos and Delphi. Just as, for example,
Rollo the Norman defended France against his kinsmen, so these Ionians defended the
Attic lands against the Ionian inhabitants of Chalcis on Euboea.
It is no wonder that he who protected the land ultimately became its ruler, whether
76215 amicably or violently. The legend has Ion, the son of Apollo, or Xuthos, probably a
double of this god, and Creousa, the daughter of the Erechthees, ascending the Attic
royal throne. Under this Ionian rule, the Attic State was first completed. All
independent principalities were abolished; the various parts of the country ceased to
76220 have their own political interests; only in one place, Athens, would the common
affairs of the country henceforth be dealt with. The king would be supreme judge of
all, and those who had previously commanded supreme power in their district would now
be able to make their voices heard in the king's council. This is the so-called
Synoikismos, which the legend attributes to King Theseus, an Ionian tribal hero. But
76225 it didn't stop there. The adjacent families were united thirty by thirty into so-
called phratries; three phratries again into one tribe (phyle); four phyles existed
in this way in all. The phratries and phyles were considered a wider family circle;
newborns and newlyweds were introduced to the phratry; centuries later, they too
considered the murder and manslaughter committed against one of their members as a
76230 matter that, after the closest relatives, concerned them as well: just like the
family, the phratries and phyles were bound by a common cult of gods; they honored
the Ionian Apollo as the paternal god (Patroos), along with the Pelasgian Zeus, the
protector of the family hearth (Zeus Herkeios). It was, after all, an Ionian
institution, extending over a Pelasgian people. Just as the Phylaeans did, the entire
76235 state, now established, naturally acquired its common cults; especially the festival
in honor of Athena, celebrated on the goddess's hill, now became, as the Panathenaia,
a festival of the entire Attic people. Sacred was the ancient bond of the family; the
state also grew up independently alongside the family in Attica, but the Ionians
created a bond around it, through which the entire people acquired something of that
76240 intimate sense of cohesion that characterized the ancient families; outside of these
forms, a close union of people among themselves was still unimaginable. Now that the
entire state had become a sacred family, the family could also relinquish to it what
it considered its most peculiar domain everywhere: blood vengeance and its associated
matters. There were five blood tribunals on Attic territory; The most important
76245 cases, those of premeditated unlawful murder, were tried on the steep hill of Ares
(the Areopagos); opposite the castle itself, close to the sanctuary of the Eumenides,
Semnai, the Erinnyes resided. The relatives, the former blood avengers, became the
accusers, supported by the members of the phratries.
Perhaps even more so than England to its Normans, thanked Attica for its national
76250 unity and political organization to its Ionians. It was a profound change in existing
conditions brought about by the measures described. Nothing more or less happened
than that a civilized, orderly state put an end to a disastrous and degenerating
feudal fragmentation; the memory remained that nowhere in Greece had the right of
76255 fist been so quickly suppressed as in Attica. What a completely different position
the Attic nobility began to occupy under the rule of the new institutions. Those who
had previously led religious ceremonies individually, each within their own lineage,
and seemed to possess the requisite knowledge of divine matters, without which the
community of the lineage could not be maintained, were now, now that the state was
76260 believed to have been built from the union of the lineages, jointly with the king
considered the experts on those divine decrees upon which the state rested. They knew
how-through what ceremonies and sacrifices-those ordinances were to be upheld. They
knew the laws and customs, also divine in origin, by which one had to live; their
knowledge naturally directed them to government. Their dwellings, whether in the
76265 countryside or in the city, were undoubtedly magnificent; magnificent stud farms, a
requirement of their station, testified to their immense wealth; with submissive
gratitude, the farmers of the plains, the poor fishermen of the seacoasts, or the
wretched goatherds of the mountains, received the rich gifts of their noble
76270 generosity; one looked up at them in deep awe as they stood proudly, full of self-
confidence, in their beautiful chariot, with the swift charioteer beside them,
driving the fiery four-in-hand. Yet, however much all this might elevate him in the
eyes of their lesser fellow citizens, those who, as less entitled orgones,
participated in the political sacrifices, revered the nobility primarily for that
indispensable knowledge of the divine. Thus, the latter found its most important task
in promoting the highest interests of the common fatherland; the city was the primary
arena of its activity. Later, after the Dorian migration, the power of this

76275 republican movement was also felt in Athens, which, a natural product of Hellenic
intellectual development, as has already been demonstrated, then made itself felt
throughout Greece. Here, too, monarchical authority gradually collapsed, and that of
the originally co-ruling nobility ultimately took its place. The monarchy, which had
76280 established the unity of the country, fell. For centuries, however, people had been
accustomed to living together within the divine family community of the state, and
even the idea of retreating to their districts in feudal independence no longer
entered the nobility, who stood at the head of that community.
With what reverence did the inhabitants of Attica gaze upon the citadel of Athena,
what a sense of security it gave them to lay eyes on the sacred dwelling place of
76285 that "protector of the city, who gives victory and always protects"¹⁾. Throughout the
Attic countryside, she, the Attic City Goddess, was venerated alongside the other
gods²⁾, but nowhere did they feel more at home in her own territory than on that hill
of her choosing. There she lived—not to mention her small shrine as Goddess of
Victory—in the mighty house of the Athenian tribal hero Erechtheus,³⁾ the double
76290 temple, in the rear of which one found altars to Poseidon, Erechtheus, and Boetes,
the semi-divine progenitor of the highly noble line of priests of the Goddess, the
Boetes. In the main chamber one saw the rather shapeless wooden statue of the
Goddess, adorned with a splendid robe, a helmet on her head, a spear beside her—the
most holy thing that had descended from heaven itself. One gazed at it with
76295 trembling, as if expecting a miracle at any moment; was it not as if it could
instantly come to life and begin to move? How many a persecuted arm had fallen
powerless before it, arms wrapped around it, invoking the protection of the Deity.¹⁾
In an outbuilding stood the same first olive tree, which the goddess had caused to
rise there when she disputed Poseidon over the possession of the land; the spring,
76300 supposedly filled with seawater, which Poseidon had caused to spring from the rock on
that same occasion with a blow of his trident, was also known to have been pointed
out. Athena, however, had triumphed through her far more beautiful gift; Attica had
since become the land of olives par excellence. Never, however, did the fortress
attract all the inhabitants of the land more than on the occasion of the great
76305 festivals. The "festival of ablutions" was especially sacred", the Plunteries; the
crowd stood in silent attention around the house of Erechtheus; one was not allowed
to approach it too closely at this time; ropes were stretched around it to determine
how far one could go. However, the assembly of the highly noble Praxergids²⁾, men and
women, entered the enclosure; they were the only ones permitted to do so. And no
76310 wonder, for the men must remove the helmet and spear from the statue, the women its
garments; not everyone is permitted to behold the unveiled deity. After a while, they
emerged with the statue itself, again hidden from the view of the unconsecrated crowd
by some covering. The procession began to move towards the west; a stream of people
followed to the seashore, where the statue was to undergo its sacred ablution. After
76315 this was completed, it was returned to its original location and again provided with
its garments, helmet, and spear. More genuine enjoyment was experienced at the
Panathenaic festival, especially in the days preceding the actual religious
ceremonies, when, before their appearance, the apobats, charioteers, horsemen, and
Pyrrhicians would compete. These were ancient, venerable displays that one witnessed;
76320 hadn't apobats already been performed by Erechthonios, the semi-divine disciple of the
goddess, during the ancient celebration of the Panathenaic festival? Hadn't Theseus
himself invented the so-called war games¹⁾ involving horsemen or chariots? Wasn't it
as if the times of Homer had returned when one saw the noble warrior, helmeted and
shielded, running past him alongside his charioteer, Diomedes alongside Sthenelos?
76325 And didn't one involuntarily think of the fleet-footed Achilles when one suddenly saw
the warriors, the parabats, with their three-crested helmets, leaping to one side
from the apobat's chariots—which were designed for this purpose—and continuing for a
time alongside the chariot in a race, the contest that had begun in a race? The
charioteers turned their attention now to the runner, then to their horses. When they
76330 had progressed so far in the racetrack that the race had to become a race again, the
charioteer was alert to turn the chariot at the crucial moment so that the apobat
could easily leap onto it without losing the course. All victors in one of the
contests received a substantial reward, consisting of several jars of the finest oil,
obtained from olive trees cut from the sacred tree in the house of Erechtheus. But
76335 once again, they felt themselves placed before the Blessed Sacrament when the sacred
night of the festival had arrived, a moonless summer night, for the Panathenaia were
celebrated in our month of August before the new moon. Torches illuminated the
darkness of the night on the hill of Pallas-Athena. Strong youths, armed with helmets
and shields, performed the ancient war dance, the pyrriche; arranged in a line, they
76340 performed the same movements, leaping up and descending in time. Men's voices sang a

song in honor of the "warlike castle goddess, the feared deity, the destroyer of castles, the warlike one, the tamer of peoples, the bravest maiden"³), but women's voices were also heard, along with the rhythmic footsteps of round dances. Finally, however—at least, that's how it seems to be imagined⁴)—a procession of beautifully dressed women and girls, accompanied by torches, began to move through the castle. Two of the four arrephors, noble girls who had been dedicating themselves to the goddess's service for a time, were led down to the sacred cries of the women (ὀλολυγή) and on to a sanctuary of the Eumenides, Semnai. There they descended into a subterranean cave, where they deposited something they had worn on their heads all this time, something sacred, the true nature of which no one knew. The ancient Erinnyes had, after all, been transformed into Eumenides by the Goddess of Light. After the night, a great feast day followed. The Arrephors had to carry something from that cave back to Erechtheus's house, and besides that, the Goddess also had to bring the beautiful new robe (peplos), which priestesses, Arrephors, and perhaps other women as well had made. The Arrephors and the peplos bearers went first, then followed noble maidens, carrying the baskets in which the sacrificial knives and other sacrificial implements were kept, canephors, and then oxen for the sacrifices; the procession organizers stood aside, apobats, the chariots, and the horsemen of the martial games brought up the rear. Music and song undoubtedly accompanied the whole procession. The Attic people followed this procession as closely as possible. When the peplos and the sacred objects which the arrephoras carried had been laid down in the temple and the sacrificial smoke from the hecatombs of the great altar as the city rose up on the fortress, people felt safer than ever under the protection of the City Goddess, and under that protection, more closely united with each other.

A.E.J. Holwerda.

(To be continued.)

The Attic people and the art of Phidias. II.

Thus the Athenian state developed between the Peloponnese, with Sparta and Olympia, on the one hand, and the Ionian-Aeolian islands and coasts, with their trade and commerce, their vibrant political and social life, on the other. It is understandable that the city around the fortress, as it became the true center of the country, expanded. It also acquired a certain renown, although until then, in every area, it followed rather than preceded. Thus, it was undoubtedly influenced by the great centers of Hellenic civilization: the ideal aspirations of Sparta and Olympia ignited souls here as well. The Athenian singer Tyrtaeus encouraged the Spartan warriors in the war against Messenia. Attica also acquired its hippodromes and wrestling arenas; this country, too, had its Olympians (victors at Olympia). The ancient center of the Ionian tribe, Delos, which naturally also held significance for Athens, was probably almost entirely neglected at the time, but understandably, they maintained contact with their own colonists, who had migrated from Attica to the Asian west coast after the Dorian migration. Furthermore, Athens undoubtedly played a significant role in trade. Yet, even here, the city remained somewhat in the background. From Athena's hill, one could see the island of Aiaceus's descendants, Salamis,¹) lying before them. No movement on the opposite Attic coast was possible—and precisely there lay the country's principal ports, such as Eleusis and Phaleros—unless it was permitted at Salamis. The power of the Salaminian Aeocenes fell, but the situation then became even more untenable for Athens, as powerful Megara, Attica's western neighbor, now asserted itself on the island. Further on, opposite the western coast, lay the other Aeocene island, the powerful Aegina, whose capital was a cosmopolitan city where, although restless seafarers and merchants, who knew no higher principle than their material interests, flocked from far and wide, Dorian Eunomia, order and legal certainty, remained.[1] Their fleets made themselves felt throughout the Mediterranean, soon reaching Egypt and Italy; their pirates instilled fear, not least on the coasts of the Attic lands opposite. Nowhere did gymnastic exercises give more resilience to body and soul than here. No city shone more than this one at the national arena at Olympia. Athens felt unable to withstand such a force. A centuries-old national resentment, the origins of which could only be explained as mythical, separated the two neighbors.

And as one walked along the east coast of Attica, one could almost everywhere see the vast expanse of Euboea before one, where powers also held sway that hindered the development of Pallas's city. Ancient Chalcis may have been excluded from Attica itself since the days of Ionian rule, but in many respects it still dwarfed it. It

exploited Euboea's copper mines; the products of its metalworks dominated Greek and Italian markets; it colonized the coasts of Macedonia and Italy, whose inhabitants, just as the Greeks themselves had previously borrowed their writing from the Phoenicians, had borrowed it from them. Between these western and eastern constraints, Attic trade could not develop vigorously. On land, like Megara on the west side, there was the rather powerful Thebes on the northern border. Until now, we haven't seen art particularly prominent among the Hellenic tribes. However, for some time now, a vigorous new life has also emerged in their region. And for this, too, one shouldn't focus primarily on Attica. Around the 9th or 8th century, that tremendous invasion of Semitic and Egyptian art forms took place, causing the ancient Greek art industry—which worked with original Indo-Germanic types, with plant and animal forms from their own homeland, and with imported patterns from Asia Minor—which, for convenience, can be called Mycenaean¹), underwent a complete transformation. The Phoenicians brought all sorts of wares to Italy and Greece; excavations have brought many of them to light, including several metal vessels. They didn't possess their own stock of art forms; He combined the sacred symbols of Assyria and Egypt by way of decoration on the same bowl or cauldron, even Egyptian hieroglyphs served as such; numerous images were composed, at least partly based on models of the same origin, which sometimes had no meaning, then again had something real, occasionally even representing entire histories. This Phoenician industry was soon also practiced on Cyprus; a few representations from Greek life were mingled with this stock of forms. These Phoenicianized Egyptian, Assyrian, and Babylonian types now penetrated Greek craftsmanship, both in metalwork and in pottery.²)

However, the Greek did not limit himself to adopting all these forms. He immediately transformed them to some extent according to his own sensibilities, and we clearly see that he only gradually began to satisfy himself in the application of ornament; For example, a floral woven fabric might move to the neck of a vase, where it winds itself curiously, after first being applied to the bottom of the vase's rounded belly—a place more suitable for a supporting and uplifting ornament. Therefore, the Greek vase painter very soon favored rays springing from the pedestal, upward-stretching spindles. The actual images that appeared on the Eastern models were often, it seems, recreated in depictions of Greek daily life or mythology. At least, while in the Mycenaean period any depiction of anything resembling a scene was extremely rare, the number of pictorial poems now increased dramatically.

The world of the gods and heroes increasingly took precedence. Like the epic poets, the illustrators drew from the same endless ocean of Greek folk tales. The same gods, feared before the wooden idol as a mysterious, magical force, are spied in the Homeric songs in their most ordinary actions and behavior, and are also seen in the images now sold by the thousands in Greek markets, in all their natural movements like ordinary people before them. We still possess several bronze stripes provided with various designs; these were attached to household goods as decorative elements. People soon began carving these figures, so that they stood out clearly as a bright background against the wood to which they were attached. Some of these carved figures still exist; their design is further refined within the outline by various engravings. Such products of art industry were magnificent when, for example, figures made of gold and ivory were assembled on a background of cedarwood. The ivory often served to depict the bare parts of the body, especially the face and arms. The most famous work in this vein was the so-called Chest of Cypselos at Olympia, a votive offering from the powerful rulers of Corinth, also made of cedar wood, ivory, and gold, depicting a wealth of legends in no way surpassed by those of the Iliad or the Odyssey. We are somewhat familiar with this piece from the very precise description by Pausanias. Naturally, this artistic movement did not remain entirely without influence on Athens either. Although Attica probably did not possess works that could be compared to the Chest of Cypselos, the remarkable Greek vase-making industry, which ensured the widespread dissemination of artistic representations, much like lithography and photography today, ensured that no one remained entirely unaware of what was being produced, particularly in the Peloponnese. Corinthian, Chalkidian, and so-called Cyrenaic vase-making emerged, transferring the images from woodwork with metal fittings to the vases; Black paint usually represents the metal, white probably the ivory; the engravings on the figures are rendered by craters; the yellow or red of the vase's surface provided the base, as did the wood there. Athens did indeed connect other commercial products with the artistic world of the time, and it undoubtedly produced quite a bit itself. Yet, even in this respect, it occupied only a very modest position.

The time was approaching when Attica would offer a very unique spectacle. The inner vitality of the old Attic state and its suitability for further development would be

strikingly revealed. This, too, played a significant role in the political and social turmoil that then, from Ionia and Aeolia²), stirred most of the Hellenic states. Here, too, doubts about the right of the nobility to be custodians of the divine decrees upon which the state rested became increasingly serious. The arbitrariness to which one was exposed, especially in matters of justice, had grown greater since monarchical authority no longer kept the nobility in check³), and was increasingly felt. Here too, the growing trade exerted its influence to a great extent.

The forms of the patriarchal state became too narrow to encompass the broader developing society. Increasingly, legal cases arose regarding which it was easy to see that the old legal tradition of the nobility had established nothing; after all, provisions, such as those concerning blood revenge, were particularly peculiarly at home in this tradition, which still strongly recalled the old family law. The nobility, by virtue of the fundamental principles of the state, simply had jurisdiction, and its rulings, regardless of their nature, had to be accepted by the community (δῆμος) as in accordance with that old legal tradition, regardless of whether they were or were not. This situation eventually became untenable. Moreover, in Attica, as elsewhere, it was now not merely poor farmers or herdsmen who the nobility had at its side; here too, a class of non-noble merchants and industrious people had emerged, who owed everything solely to themselves and, through the sea and the freer, more varied life outside the rural district, had more or less freed themselves from the ban of inherited reverence for the noble landowners. Such people were easily convinced, indeed often already possessed this conviction to some extent, that they, too, deserved a share in the administration of justice and government. And indeed, they had fairly escaped the tutelage of the nobility—though not yet, of course, that of demagogues, who, rightly or wrongly, were attributed selfish aims. But even among these small farmers and herdsmen and the like, something of these democratic ideas penetrated. At least then, they had the least reason to be satisfied with their situation. The developing trade, it seems, did not benefit them; Attic soil produced nothing, except the olive, that could fetch high prices abroad; everything became more expensive, the old barter system disappeared; one could obtain less and less without money, yet money was still nowhere near enough for one's needs—oh, if Lydia would only save the day!—and one was forced to borrow at astonishing interest. [This sentence appears to be incomplete and should be omitted.] People became impoverished, and all too often the end result was that one was sold as a slave and, far from pious Athens, far from the glorious sanctuary of the Patron Goddess, had to forget that one had once lived as a free man under the protection of that deity. Was it any wonder that people resisted such a situation with all their soul? Here too, the equal distribution of goods became the slogan under which one wanted to initiate the so-necessary social reform.

How could the nobility have maintained its privileged position under such circumstances? Yielding was inevitable. Archon Draco (621) also admitted the municipality to the judiciary and issued written laws. The mysterious veil that had enveloped the nobility as custodians of divine right had been torn. In the castle, anyone who wished could read the divine laws by which they were to live. The ancient law had been written down, but even on those points where the greatest irregularity had prevailed, since the old tradition had not established anything about them, written regulations had now been made. Draco was a man of strict principles. He could think of no law except one that, like that old tradition, aimed at upholding the mysterious divine foundation of the state. However, this could be jeopardized even by a minor offense; after all, blood shed even involuntarily had to be atoned for in the interest of society as a whole. Draco knew no other way to fulfill his duty than by demanding the highest possible satisfaction for every offense for which he had to make a legal provision; the theft of crops was punishable by death, as was murder. It is understandable that such legal provisions were just as inadequate as the previous arbitrariness, and the idea developed more clearly that legislation was needed that was not an extension of the old patriarchal right of the nobility, but rather stood alongside it. The unrest in state and society continued unabated. Meanwhile, the nobility itself had also begun to lose some sense of its higher right. The obligation to safeguard the most sacred interests of the state as a community no longer bound the noble lords to each other. Everyone's ambition chose its own path. How much more powerful now was the example of foreign tyrants. The Athenian Kylon, a brilliant victor at Olympia, married to a daughter of Theagenes, the tyrant of Megara, occupied the city's fortress, intending to rule supreme from there. This mobilized both the nobility and the community. People gathered around the fortress; soon, however, they abandoned the siege. The hounds and the regular army overran. Kylon himself escaped. Hunger finally

76540 allowed the besiegers access. The remnants of Kylon's followers are seen sitting, almost dying, beside the great altar of the Goddess, under whose protection they had placed themselves. They were driven from there, lest they defile the sacred place by their death, but were then murdered in a blind frenzy, some even at the Semni altars below the castle, which they had managed to reach.

76545 The main perpetrator was the Archon Megacles, from an ancient noble family. What a state of affairs! The sacred right of protection of their own Castle Goddess had been trampled upon. A terrible bloodguilt rested on the community. Even the Semni altars themselves, in their mad blindness, had not been spared. Like wild Furies, these would rise from the earth, and from the noble court on the hill of Ares (Areopagos), no help seemed to be expected. Where was the nobility now, the upholder of divine decrees?

76550 Under the leadership of the noble regents, the most sacred right had been brutally violated. Megacles and his followers held their ground in the city, defying all calls for a judicial verdict that would purify the land of bloodguilt. "God-fearing" Athens had broken with the Deity.

76555 How utterly lacking was all peace of mind, all noble self-confidence that seeks its support in higher power. They were struck with moral powerlessness. Salamis had been lost to Megara. After several failed attempts, they decided to abandon all thought of recovery. They resigned themselves to the shame of humiliation. Soon they would be ashamed of the name of Athenian. Happy the land that produced sons like Solon, son of Exekestides, sprung from a noble lineage, a man like few capable of reconciling us

76560 with our human nature. He fully knew what it meant to enjoy life. Beautiful horses and hunting dogs were his utmost delight; how he delighted in lively conversations with strangers, guests who came from here and there; both female and male youth enraptured him; "the works of Dionysus and Aphrodite were both dear to his heart, along with those of the Muses"; even excesses, those we most deeply detest, were not

76565 foreign to him. Yet, just as much as the human desire for pleasure, from this truly Hellenic soul welled up a noble enthusiasm for the fatherland, a sincere love for his fellow man, a sacred reverence for the divine. All that was immoderate was foreign to him; he knew no restless pursuit of wealth and power; even his best feelings did not lead him beyond himself. Everywhere in him we encounter the sober, common sense of

76570 humanity. The few remnants of his poems still refresh our souls today, after more than two thousand years. Astonishing was the moral force that resided in this man, yet it never tempted him to any mighty act. Here was the rock upon which a despairing people could place their hope; here the force that could unite the scattered and compel the proud Megacles to bow his head for the common good. He and his followers

76575 must stand before a tribunal; all the guilty go into exile; even the remains of those who have since died are brought across the border. Breathe again. At Solon's call: "Onward to Salamis!"²⁾, the able-bodied Attic men take up arms. The island is recaptured; once again, one can walk among the Greeks with upright heads.

76580 But there was a need for an even more intimate reconciliation with the Deity; State and society had to be, as it were, re-established on divine foundations. Following the advice of the oracle of Delphi, at the request of Solon, his friend, the venerable seer Epimenides from ancient Crete came to Athens. He was a man with profound knowledge of the sacred, profound insight into human nature as well. He knew the sacrifices of expiation, purifications, and sacred edifications that could

76585 restore the bond with the Deity. Didn't a higher peace descend upon all souls when the black and white sheep of the Areopagos, from which, of course, the purifying effect must emanate, were seen descending in all directions, even far into the Attic lands, and an altar was erected at every spot where one of these animals happened to lie down? What sacrifices were kindled; what new religious regulations were

76590 established! That the great altar in the castle and that of the Semni, in particular, required special purifications, goes without saying. The Cretan seer worked towards a complete moral rebirth of the Attic people. He also gave the significant indication that one should be 'more calm in one's mourning, and that one should dedicate one's care for the dead to religious worship.'

76595 "Serious ceremonies must be sanctified, and women must be less offensive in their lamentations."¹⁾

76600 Attica also made its voice heard powerfully in general Hellenic affairs. It acted as one of the principal protectors of the sanctuary of Delphi against the nearby Krisa, from which it had endured much harassment. Solon's influence was entirely predominant. Why should he not, like his wise contemporary on Lesbos, Pittakos, seize the highest authority, or rather have it bestowed upon him? Wasn't this really the only way to provide lasting peace to the state? Solon thought better of his people. Would they only be able to conform to order under the tyrant's scourge? As for himself, his sober mind told him that for him this path would only yield the fleeting

76605 glory "of a day," to be discarded afterwards as a useless object.²⁾ In other ways, he
 "hoped to gain victory over all"³⁾.
 He acted as a legislator (594 BC). First and foremost, it was important to alleviate
 the burden on the poor. Debt repayment was made easier, primarily by changing the
 monetary standard; no citizen was allowed to be sold into slavery for debt. Those
 76610 already sold, as much as possible, returned to their homeland. How that Attic
 nobleman—and it was his job—enjoyed seeing his unfortunate, poor fellow citizens
 return, "who had often forgotten their native dialect, wandering here and there,
 enduring harsh slavery, trembling before their masters, but now had become free
 men"¹⁾. Furthermore, he seems to have made provisions to prevent the formation of
 76615 large plantations²⁾. He fully understood, and legal provisions were also intended to
 instill this idea in his people, that a country as infertile as Attica, if it wanted
 to play a significant role in world trade, would do best to devote itself vigorously
 to industry. Athens later became one of the leading industrial states of the entire
 Hellenic region. Furthermore, his practical intellect did not shy away from doing
 76620 what had become evidently necessary: to separate the old, sacred law from a more
 profane one that met the immediate demands of society. Of the laws of Draco, he
 retained those concerning blood revenge, regulations truly stemming from ancient
 legal tradition, and the council of Areopagos was to constantly monitor their
 enforcement. For the rest, he established a new law according to the new needs, and
 76625 legal cases judged accordingly would be heard by a jury composed of members of the
 community. The most important state interests would be decided by the community in a
 popular assembly, under the supervision of the Areopagos. For the day-to-day
 administration, a council of four hundred members was established, elected from the
 four tribes into which the people had traditionally been divided^[3]; one hundred from
 76630 each tribe. Indeed, Solon had no intention of abolishing the old religious
 organization of the state, and the sacrifices of tribes, phratries, and lineages
 remained, as before, essentially sacrifices of the nobility, to which only the lesser
 citizens were admitted. This was the only prestige the nobility retained as such;
 yet, it acquired greater influence on grounds other than its nobility. Eligibility
 76635 for holding state office would depend on the annual yield of each person's fields,
 and now the nobles were the principal landowners. Those who belonged to the highest
 class, for example, according to that annual yield, were allowed to become archons,
 and the resigned archons of impeccable conduct became members of the Areopagos.
 Something had taken place that Greece, and perhaps the world, had not yet seen:
 76640 democracy had been organized and incorporated into the forms of an ancient state. But
 Solon understood very well that this was dangerous territory, and he demonstrated
 this in ways other than the partial maintenance of the nobility's influence. In the
 Aeolian and Ionian states, it seemed that the autocracy of a tyrant was often
 unavoidable. If the Athenian people wanted to govern themselves, they should not
 76645 become too Ionian or Aeolian. Solon decreed that the popular assembly would be opened
 with prayers and a purification offering; first, those over fifty would be called to
 speak, then the opportunity would be given to others as well. no one was allowed to
 speak who had not properly supported his parents, if necessary, who had thrown away
 his shield in battle, who had squandered his paternal inheritance, etc. The popular
 76650 assembly was not allowed to acquire the character of an Ionian chatting society, in
 which the most boisterous easily prevailed and the ferocity and passion of a few
 easily spread to the whole. One had to feel deeply that they had gathered for a
 highly serious work. Unworthy people and those who could not manage their own affairs
 were also not the proper advisors of their people. Furthermore, however little he
 76655 thought to disapprove of sensual pleasure as such, laws and limits had to be set for
 it too; children, for example, had to be safe from their teachers. Parents who
 profited financially from their offspring's youth were also despicable. A child thus
 abused did not have to support his father in his old age; he owed him only a funeral.
 Deep respect was instilled for the institution of marriage through various
 76660 regulations. Idleness was punished; parents were required to teach their children a
 trade. One was never to say anything bad about the dead, nor about the living in
 shrines, government buildings, or courthouses; The lively Athenian had to learn to
 curb the urge to say whatever bluster or passion prompted him. The legislator, as
 evidenced by these and similar provisions, often strange to our minds, considered
 76665 modesty the most essential virtue for a free citizen. The Ionian's soft life was also
 to be stigmatized, his unbridled luxury kept as much as possible outside the borders
 of the country; the preparation of fragrant ointments was deemed unworthy of the free
 citizen; the flamboyant processions of prominent women with flashy, lavish clothing
 and large entourages were forbidden. It had also been against the Athenian way of
 76670 thinking since ancient times to allow women too much freedom of movement. Apparently

in response to the suggestions of Epimenides, regulations were also established regarding the funeral of the deceased: for example, it was forbidden to bludgeon oneself to death in lamentation and to bury the dead with excessive pomp. In this way, too, he took a stand against Ionia. Thus, in Solon's legislation, and to this it owes its high significance in no small part, the Athenian comes to a powerful consciousness.

Thus, Solon met the most profound needs of the Athenian people. They now had regulations for their political, social, and even personal lives that were more in keeping with their level of development and their spiritual direction, in which they also found themselves, yet in their deepest feelings and inclinations. They freed themselves from the idea that they had to live in all respects according to precepts that in one way or another bore a special divine stamp, and had the courage to enter before the eyes of the immortal gods with a completely new order of life, an order created according to their own human insights. Solon's legislation cannot be explained without a certain freedom of spirit in the religious sphere.

Again, we must turn to the more general Hellenic realm. There comes a time in the life of nations when people no longer simply accept the things around them as they present themselves, but the thinking mind feels itself awakening amidst numerous riddles that attract it and whose solution it considers its task. Among the Greeks, this period of development is first encountered in the colonies, whose youthful societies were less bound by tradition and where the lively traffic on the coasts incessantly aroused the mind—especially in Ionia, where, after all, any restraint on the mind was so largely shunned.

Already in the oldest school of Greek philosophers, the Ionian of Thales and Anaximander, we find a fundamentally genuine scientific endeavor, independent of all tradition and without need for arcane formulas. Alongside this stricter trend, however, a certain practical rationalism revealed itself, which did not seek to create a new system of world explanation, but rather to explain and more deeply grasp all things that occurred, including all traditional concepts, without any connection to each other. On the one hand, this, along with this stricter philosophy, is a weaker offshoot of the same stock; on the other hand, it is quite common that the latter provokes reflection even in circles where it penetrates only slightly, at least not in its true form. Life's events, especially the social and political, human experiences and vicissitudes, indeed, the entire human existence, human character and inclinations, now became a subject of reflection, and thus far only among thinkers of that less strict trend, such as Theognis and Solon. The time had long passed when people simply absorbed and recorded those things as they found them, when they simply listened – and listened with a lively interest down to the smallest details – to the epic story about the deeds and the adventures of gods and men. Then, especially in that time of deep turmoil in state and society, the more lyrical forms of poetry came into vogue; one was stirred to the depths of one's soul by sorrow, joy, or enthusiasm. Ultimately, with the philosophical sentiment just mentioned, one knows how to rise above one's feelings to some extent and, with the calmness of Solon, or the residual bitterness of Theognis, to judge the world from which one has, as it were, withdrawn for a while, from a higher vantage point.

It was not the bright joy of life of the Light deities that primarily filled the souls of such philosophers. Contemplation of human life presented them with more shadows than lights; through misfortune and one's own wrongdoings, humanity was often deeply miserable. In this state of mind, the older folk ideas of Moira Atê, Erinnyes, and the vengeance of the Gods punishing presumptuous arrogance—ideas which, as already noted¹⁾, had always managed to hold their own alongside this more life-loving outlook—suddenly acquired greater significance. Conceived more profoundly and applied more extensively, they somewhat take on the character of a system of poetic-philosophical explanation of human life. Moira (fate) is a dark force in the world that no one can escape; indeed, it was thought that even the Gods were not.²⁾ Arrogance—which today, for example, also manifests itself in the unjust pursuit of wealth; in ancient myths, the moral principle is not so prominent—this arrogance could thrive for a time, but then the first rudiments of Atê manifest themselves; This spreads all around and often even plunges an entire family into disaster; indeed, subsequent generations must suffer for the guilt of their predecessors. One sees a mysterious divine power governing human life, and man is completely unable to escape its dictates.

3) It is the same philosophy of life that later, in a more fully developed form, also comes to us in Attic tragedy; it presents us with incidents from the lives of semi-divine heroes, especially as the Atê and the avenging power of the gods manifest

themselves in them. The tragic mood it evokes in us is, for it, the main point, but this by no means excludes a poetic-philosophical view of human life. It is, therefore, the way of thinking of an entire subsequent period that now appears before us; it developed approximately at the end of the 7th century, reaching its zenith in the 5th. How much more profound did the entire concept of the divine become during these reflections on the world and fate? - it has already been pointed out that those ancient concepts such as Atê and divine vengeance would play a major role. [This sentence appears incomplete and should be omitted.] Infinitely deeper does the true religious sense of dependence become in the face of such a mysterious, higher power; that power, at least later, at times acquires something almost impersonal; one feels the influence of the divine more than of the Deity. [This sentence appears incomplete and should be omitted.] No longer, as in Homer, for example, do the Gods restlessly interfere in human affairs, now here, now there, entirely in the manner of human participants, at one moment fighting alongside their friends, then offering advice, then, for example, handing Odysseus a new mast for his ship, etc. [This sentence appears incomplete and should be omitted.] Calm dignity is now the essence of the Deity. Zeus no longer "suddenly flies up in his wrath like a mortal." Seated on his throne, not every evil deed he witnesses immediately provokes him to revenge; he calmly waits, so that, as soon as he pleases, he can suddenly bring down punishment with crushing force like a storm. 4) The gods command supremely, and the world submits to the will of these formidable beings, who, in the most imperturbable tranquility, quietly survey everything. They see the pious and the impious, and comforting is the thought that the latter can never escape the punishing hand of the Deity. Never? Simultaneously with the profound concept of God, the idea arises here, so eminently suited to drive the pious Israelite or Christian to despair, namely that the God "who knows all minds and emotions, who holds supreme authority over all, nevertheless occasionally grants the good an equal fate with the evil." The Erinnyes, the ancient representatives of the incomprehensible, terrifying, and mysterious nature of the Deity, acquire a very high significance for the inner life. People were on their way to breaking the spell of humanizing the Deity, and for some it came close to this, as with Aeschylus, for whom Zeus was the "unspeakable, incomparable," for whom he is "everything." Yet this was not in the general Hellenic spiritual direction; people were content with pushing the boundaries of the human aspect as much as possible. In Homer, the larger stature of divine beings is not yet a fixed principle. This is now becoming the case; we will return to this shortly. Later in tragedy, as is well known, the actors were given bodices to appear larger than they were, since they were, after all, supposed to represent demigods. The mythical stories about the gods themselves recede into the background or take on more of the character of a sublime world event. For example, in Pindar, heaven and earth tremble with terror when the heavenly maiden Athena first appears in her magnificent majesty. Thus, alongside the stricter philosophy—which stood outside the old tradition and therefore could more easily, and indeed did later, come into conflict with the old religious ideas—also developed alongside this, and indeed to some extent under its influence, an enlightened religious conception. This conception did not consider placing itself outside the old circle, but, without being aware of any deviation from the old way of thinking, infused the old with a new spirit. It was the conception of the aristocracy of the spirit—not in the narrowest sense, so that it encompassed only the strict thinkers—and the old way of imagining the gods continued alongside it as the way of thinking of the general public. This continued to delight particularly in the old myths and incorporated them even into the most common stories. The birth of Athena, for example, is depicted in a flat reality on vase sculptures; A tiny Athena emerges, to the amazement of the gods present, from the head of Zeus. They adhered to the most common humanization of the divine, and the idol nevertheless retained its fetishistic nature quite strongly. The enlightened, however, looked down on the superstition and stupidity of the masses. Evidence of superstitious stupidity was, for example, the fact that the Athenians were led to believe that Athena herself—a wench disguised as such—brought the tyrant Pisistratos back to the city;¹ similarly, when an ancient oracle declared that Athens must be defended behind wooden walls, some actually barricaded themselves behind a wooden plank against the Persians.² The enlightened view was that of Themistocles, according to whom wooden walls meant ships. Naturally, there was little room in the souls of these enlightened people for genuine fetishistic tendencies; They were undoubtedly more indifferent to the ancient idols, unless the mystery surrounding those ancient sacred blocks of wood appealed precisely to their often deeply religious minds. Both perspectives, however, stood on the same foundation. They also gradually merged; something of both could be present in the same human soul; now one, now the other,

could dominate; the lower-minded could easily be temporarily elevated into the higher spheres, just as historically the higher way of thinking had risen from the lower. Therefore, for the time being, there is no sign of a division into two hostile camps between adherents of different opinions.

Precisely at the time when Hellenic society was thus being infused with new life, it also came into direct contact—no longer exclusively through the mediation of the Phoenicians—with the great world monarchies of the East. Assyrian rule had reached the Mediterranean coast; Cyprus was also drawn within the larger circle. 3) An Assyrian cylinder lists ten kings of Cyprus, "which lies in the middle of the sea," who were tributary to Esarhaddon, an Assyrian king from the early 7th century BC. 1) The ancient Pharaonic empire was opened to the Greeks from the mid-7th century onward, and they maintained the most lively relations with it ever since. Later, the Median and Babylonian empires established themselves on the ruins of the Assyrian empire; the Medo-Persian empire finally extended its borders into Greek territory, to the coasts of Asia Minor. Greek mercenaries of an Egyptian king, Psammetichos—probably much earlier, certainly not much later than the year 600—carved their names into the Ramses' colossi at Abu Simbel in Nubia. The distinguished Lesbian Antimenides, brother of Alcaios, enlisted in Nebuchadnezzar's army when his tyrannical homeland no longer offered room for his noble ambition. The mighty palaces and colossuses of those wonderlands made a deep impression on the receptive Hellenic mind. As we have seen, Greece already possessed a fairly developed art industry, which included works like the Kupselos cabinet. Crude bas-reliefs were also available early on. However, the production of freestanding statues—which, the less they are household goods, can more easily become artistic creations for their own sake — was still in its most original state of crude handcraft, devoid of any conscious artistic endeavor. This certainly doesn't entirely apply to wooden idols, though they undeniably still had very little form. Besides these, the Greeks had, until then, talisman-like idols, statuettes of people and animals, dedicated to the dead, found in graves, and similar votive offerings to the gods, including primarily human statuettes; for it was an ancient custom to dedicate one's image to the deity, presumably in place of oneself, just as statues of sacrificial animals were also considered sacrifices. A relic of this custom persisted into much later times in the custom that victors in combat games were allowed to place their statue on the sacred grounds where they had achieved their victory, although by then little was felt of its original significance. None of these had any national style whatsoever; they are primitive products, such as can be found all over the world. They were mostly made of baked clay, very occasionally of marble, and even then extremely rough; in Cyprus, many were also made of native limestone. They were all small. Among the wooden idols, some larger ones appeared. Today, however, the contemplation of Egyptian and Assyrian sculpture makes their influence felt. We know Cyprus best from that period through numerous excavations. The mass of sculptures, especially of native limestone, that we encounter here is astonishing. What Egyptian collars, tunics, and hairstyles! The left foot is depicted countless times in a completely Egyptian manner; the shoulders often have the same high and broad shape. The face and hair, however, are much more predominantly Assyrian, and generally speaking, in the finer art of art, the Assyrians seem to have been more the teachers of the Cyprians than the Egyptians. In Cyprus, one can certainly find one, probably more, fully Assyrian works of art. It is striking, however, to see how immediately the Cypriot Greek breaks the rigid Assyrian stylization; for example, the eyebrows, always joined together by the Assyrians (there is no soft transition such as occurs in nature), are immediately separated. From the very beginning, Greek sculpture has nature before its eyes, just as Greek philosophy, from the very beginning, strives for truth with an unbiased approach. It is also noteworthy that the statues begin to acquire a fairly large size; even enormous colossuses appear among them; for example, General Cesnola found a severed head, so large that it must have belonged to a statue several meters tall; over eight feet high is also a statue of the demigod Heracles, with a pedestal on which a relief is carved depicting the captivity of Geryon's herd. Among all the statues found, there are at most a very small number of actual gods. The overwhelming majority consists of statues of people dedicated to the deity, as mentioned earlier, mostly of priests and priestesses. It is noteworthy that little or no thought seems to have been given here to the deliberate treatment of the nude.

Thus, Cyprus developed a great deal of activity in the realm of sculpture itself, at a time when it was practically unheard of in the rest of Greece. However, it never became fully Hellenic; thus, for example, it always remained monarchical. It is not unlikely that Hellenic sculpture owes its origins largely to the example of Cyprus; it was almost certainly influenced by Cypriots; the Assyrian-Cyprian treatment of

hair, for example, appears quite frequently in the oldest Greek art. Cypriot art, however, developed further in a non-Hellenic direction; She never completely escaped Assyrian and Egyptian forms, but instead incorporated them into her own national artistic style, alongside which, later in the fourth century, the truly Hellenic style was introduced as something entirely foreign. Of great importance for the developing art of the mid-seventh century was the opening of the marble quarries of Paros. Melas of Chios emerged as a marble sculptor at this time; his art passed down as a family legacy to his descendants, his son, grandson, and great-grandsons, and remained so in his lineage for over 100 years. Naturally, the new craft was soon practiced outside of this circle as well. A form of sculpture arose on the islands and coasts of the archipelago, which one might call the Ionian. It is not unlikely that what the Cyprians did in their limestone, they began to imitate in marble. In the art school of Chios, as we have seen, they applied themselves, especially regarding the workmanship of female dress. The principal remains of this Ionian art that we possess are seated statues larger than life, found near Miletus, now in the British Museum, as evidenced by an inscription, statues of people dedicated to Apollo. All this is already reminiscent of Cyprus; even more so is the Assyrian treatment observed here and there, and even the more or less specifically Cypriot character of the dress.

Alongside this marble sculpture, a metal one emerged. Samos produced two famous metal founders, Rhoikos and Theodoros, at the beginning of the 6th century. The most powerful, most ancient, and yet most genuinely Hellenically inspired artistic movement, however, originated, at approximately the same time, at the beginning of the 6th century, from Crete, the island of the Greek art hero and mythical creator, above all, of woodcuts, Daedalus. Especially then, that island, which already in ancient times occupied such a prominent place in the history of Greek civilization, precedes Hellas here. The first Cretan artists, whose names have been handed down to us, are Skyllis and Dipoinos, the so-called disciples or descendants of Daedalus. They felt they had something higher to offer their people. We see them appear everywhere, especially in the Peloponnese. They worked in Sicyon, Argos, Cleonae, and Ambrakia, and founded an entire school, primarily of Spartan artists. This school produced many works for the great national sanctuary at Olympia. More independently, yet undeniably under the influence of the Cretans, Smilis appeared in Aegina, several of whose works were also found at Olympia. The focal points of Hellenic civilization, in particular, exert the greatest attraction. Art here no longer resembles a craft that was the heritage of a family. We hear frequently of groups crafted by these artists, primarily from cedar wood with gold and ivory. These were mythological representations like those found in works like the Kupselos cabinet, and since these were certainly often also made of cedar wood, ivory, and gold, both the representations and the materials of the ancient art industry were used for the new, freestanding statues. It is not unlikely that the ancient art of making wooden idols also exerted some influence. It goes without saying that precious materials like gold and ivory were often omitted. On the other hand, they could take center stage, and the wood itself became the core covered in gold and ivory. This is how the gold and ivory (chryselephantine) art, which later became so famous, came into being. Besides these materials, stone was also used, particularly Parisian marble. A statue that almost certainly belonged to the Cretan school of art was the Hera at Olympia, and, as is known, a large part of its head has now been unearthed in the most recent excavations there.[1] It is made of limestone found in the immediate vicinity of Olympia, is larger than life-size, and has a hairstyle like that of the Egyptian goddess Isis; however, the horns have broken off. According to Pausanias (V. 17), it had another statue alongside it, which is not evident, as the site is corrupt. However, the head found indicates that this other statue must have been very closely related to it, which again suggests an original relief composition. The statue has all the flattened features and broad waves of hair typical of the woodcut style. Woodcarving, therefore, preceded it; its art developed from there, and the forms thus acquired were later simply transferred to stone. Other rediscovered sculptures can be attributed to this school, especially the so-called Apollos of Orchomenos, Thera, and the British Museum; they were originally funerary monuments, probably depicting the deceased as heroes. All are equally imitations of wood in stone (marble), in the Egyptian manner with the left leg advanced, and two (those of Orchomenos and London) with the high Egyptian shoulders. Also remarkable is the complete nudity of these figures and the apparent effort (evident, for example, by comparing the apparently younger London figure with that of Orchomenos) to depict that nudity increasingly in harmony with nature. This new school of art lived and worked primarily in the Peloponnese, in circles where, more than elsewhere, people had developed under the

76935 influence of Olympia. It is well known how much the nudity of the combatants was
 considered one of the most characteristic features of the Greeks compared to the
 barbarians. The very oldest monumental Greek sculpture was already Hellenic in its
 core. All traces of Assyrian or Egyptian stylization had to disappear long before a
 76940 sense of the natural, which had been instilled in her from the very first moment of
 her development. In another respect, too, we very soon see her moving in a fixed
 direction: she increasingly focused—we find information about several of her works in
 ancient writers—on the creation of divine images. The Egyptian-Assyrian colossuses
 had passed into the oldest Greek art; the seated statues from the vicinity of Miletus
 are larger than life-size, as was Hera at Olympia; the former depict humans,
 76945 apparently not deified. This exaggeration did not, in itself, align with the Hellenic
 spirit. It was destined to disappear. Not entirely, anyway. The larger-than-human
 size gave a fitting expression to the divine; it became a fixed requirement for the
 image of gods and heroes. The famous master of Aegina, Smilis, was summoned to Samos
 to replace the old woodblock depicting the goddess Hera with a new statue. This was a
 76950 matter of no small significance, nor an isolated event. The divine statues of the new
 art replace, or even stand alongside, the old idols, and the new statues convey new
 ideas, or rather, are the more or less involuntary expression of existing new ideas.
 They may well become so in the minds of the public, but in the minds of the artist
 who created them—he may have been more or less aware of this—they are not fetishes in
 76955 which the deity itself seems to dwell, but simply representations of it. To a large
 extent, the types of works like the Kupselos cabinet, whose divine figures everyone
 had to consider mere representations, were probably transferred to the temple statue.
 Furthermore, while the colossal size of the statue expressed divinity, it also
 indicated that the artist had no intention of destining it for highly sacred
 76960 ablutions, solemn processions, and similar ceremonies, for which a statue that was
 not too difficult to lift was a prerequisite. The nobler spiritual current, which, as
 we have seen, purified the religious way of thinking of the Hellenic people at that
 time, merged with the new, higher artistic development. The more deeply the artist
 was imbued with this new perspective on the divine, which envisioned the gods in
 76965 exalted majesty, from Olympus, directing the fate of humanity, the further he became
 from the idea that the divine spirit resided more or less in the work of his hands.
 The old statue certainly often retained a higher sanctity, but the new statues of the
 gods expressed a nobler conception of the divine; Let us add, however, that this also
 marked a new step on the path to the humanization of the Deity: the representation of
 76970 the divine being became more sharply defined, and thus the mystical was more
 excluded. Was it perhaps this obscure awareness that later led a man like Aeschylus
 to prefer the old, crude images to the new, more artistic ones?

Athens is no longer far removed from these movements. It has already been pointed out
 76975 how its democracy cannot be explained without a certain freedom in religious thought,
 and now we see that precisely at the time when this was established, a new, more
 unconstrained view of the divine and human broke through, in which the democratic
 legislator Solon himself also strongly led the way. To a certain extent, this must
 already have become common property of the Athenian people when it later became the
 76980 soul of a literary genre that originated on Attic soil and occupied a place in
 popular life similar to that of tragedy. - Furthermore, a few names of Attic
 sculptors have also been handed down to us, who most likely flourished shortly after
 the middle of the sixth century: Endoios and Aristocles; we even have a tomb stele of
 the latter; and although there can be no question of a famous Attic art school, as
 76985 will become clear, the significance of the new monumental art was deeply felt here.
 Solon's last years were most sorrowful. Had it truly been a foolish delusion when he
 considered his people ripe for freedom? Party factions revived, and people once again
 listened to demagogues. The Alcmaionides had returned from exile, but the nobility
 seems to have understood that if they wanted to preserve anything of their former
 76990 selves, they had to keep such comrades at bay. Now the grandson and namesake of the
 bloodstained Megacles sought to gain prominence in another way, and he led the middle
 class, primarily the seafarers, against the noble faction surrounding Lycurgos.
 Alongside both of these, however, a relative of Solon, Pisistratos, rose to the head
 of the smallest of the people, the shepherds and small farmers; they felt disappointed
 76995 because the legislature had not introduced an equal distribution of the land. Such
 people, however, were very easily deceived. With their help, Pisistratos established
 himself as tyrant (560 BC). He was driven from the city twice. But he returned each
 time and, upon his death, left the government to his sons Hippias and Hipparchus.
 The most precious asset, freedom, was lost. Yet, the laws of Solon, insofar as this
 77000 was compatible with a single authority, persisted, and so the Athenians, to some

extent, embraced those numerous small regulations that were intended to teach them self-control and restraint and ennoble their lives. Moreover, the ambitious, action-hungry nobility felt the pressure of such authority much more than the common citizen. Pisistratus also believed that, precisely under a rule like his, the good and great qualities his people possessed could be better preserved and developed, and to a certain extent, his opinion was correct. One should not dwell on overly lofty theories; what mattered was true prestige, prosperity, and happiness. Athens had to exist first and foremost for itself. It had to be respected and revered by the Greeks above all. And truly, under the tyrant, the city's prestige rose. Proud Aegina, for example, experienced that a different authority now held sway on the hill of Athena than had hitherto held sway.

The festival of the City Goddess, during which one felt oneself to be a citizen of Athens above all else, acquired a new, brilliant organization. Shortly before Pisistratus's rise as tyrant, perhaps already under his influence, the prelude to the actual Panathenaic festival, which had previously consisted of horse races, was augmented by the addition of gymnastic competitions, where even those who didn't maintain stud farms could demonstrate their strength. Even the less fortunate wanted to be given the opportunity to participate directly in the great city festival; the entire series of these competitions was adopted from Olympia. And it didn't stop there. The annual city festival – which, we don't know since when, now qualifies as Athena's birthday—was to be celebrated every four years, in the third year of each Olympiad, with a splendor that would shine throughout the entire Hellenic world and capture the hearts and minds of thousands. The festival of the great Panathenaia was instituted alongside the annual smaller one. Just as in the fourth year of each Olympiad, thousands from all corners of the Hellenic world were to descend on Athens in the third; Festive delegations had to gather; foreigners could also participate in several competitions, but the main thing was that one would see the Athenian people celebrate the birth of their God in all their splendor—that one would behold, in that splendid procession, moving in stately procession through numerous streets to the castle, all the splendor of foot soldiers and horsemen and chariots, of youth and virile strength and gray hair, that the city of Athens knew how to display before the eyes of its Goddess at this solemn moment. Without a doubt, under Pisistratus and his sons, the procession became more of a central element of the festival than it had been. His son Hipparchus also ordered a contest of rhapsodes, who recited the poems of Homer; this would again precede the gymnastic games, just as the gymnastic competitions precede the horse races. In later times, the Parthenon of Pericles was the principal temple used for the Panathenaic festival; a single brief note, hidden in the work of a very late grammarian, Hesychius, informs us that this Parthenon replaced another temple burned by the Persians (480 BC). Now, in the northern wall of the fortress, which was hastily constructed after the Persians' departure from whatever could be found, numerous fragments of a Doric temple have been found, evidently damaged by the flames. Furthermore, it has been discovered that the Parthenon rests on an older foundation, which, before it was placed upon it, had to be widened on the north side with new additions. Judging from these fragments and what we know about Doric temple construction in general, the temple, whose fragments have been recovered from this wall, must have fit more or less precisely on this old foundation. That temple could not have stood anywhere else on the castle. We also possess the remains of a Parthenon destroyed by the Persians in 480, the fragments of which naturally provided suitable material for that wall immediately after the retreat of those barbarians. Judging by the style of the building fragments found, that temple hardly predates Pisistratus. It was also not yet finished when it burned, which is the result.

It appears that the discovered building fragments have not yet been completed. In fact, it could not have been built by anyone other than the tyrant or his sons. They gave the entire city a new appearance through numerous new buildings, and the renewed festival of the Panathenaia—we will return to this shortly—demanded a temple other than the old-fashioned house of Erechtheus; how eagerly the tyrants were to carry out works that would enhance the splendor of the worship of the City Goddess. It was probably not finished before they were expelled, and the Athenians, like another building they had begun, the Olympieion, were unwilling to complete it. Both in this new festival and in the founding of that temple, the influence of the new spirit that was then beginning to dominate the religious life of the Greeks was felt. Still, at the festival of Plynterië, one saw the ancient statue of Athena from the house of Erechtheus brought out with deep reverence. There was the least thought of abolishing old, mysterious ceremonies, but introducing new ones was equally

unthinkable. For that to happen, fetishistic tendencies would have had to possess a power completely incompatible with the then-current state of civilization. Now, however, the image of the immortal gods as clearly defined beings was more than ever before before the Greeks; not a god conjuring from a piece of wood, but an Olympian, enthroned in calm majesty high in the ether, filled the souls of the more evolved, especially. The spirit could also rise to such awe-inspiring beings through prayer and sacrifice. The latter, in the mind's eye, had often lost much of its former significance. It had become an outward form; but this had acquired a new content. The enlightened Greek also sacrificed much; he felt the need to do so whenever he wished to express a sacred, deeply serious mood; thereby he maintained the bond with the divine. The ancient custom of giving votive offerings (ἀναθήματα) was particularly in keeping with the conception of human gods. One offered something to the Deity and, as it were, placed it before her eyes, knowing that she would take as much pleasure in it as one took in it oneself. The mysterious found almost no place here; yet it was a religious act, albeit one that very easily degenerated into a most outward display of homage. This custom then spread. Especially beautiful temples and statues, splendid sacrificial implements, and the like were dedicated to the Deity. Even the most exalted Olympian, however, could look down upon all this with pleasure; even the most enlightened were happy to honor the gods with votive offerings. Closely in character with the votive offering was another way of pleasing the gods, which only became more prominent in historical times, namely through the display of splendor and splendor at religious festivals, especially in processions, and through competitions, in all that one personally enjoyed so much. Were not also several gods and demigods,—especially Heracles,—the superior examples of the same exertion one encountered in the contest, and where, indeed, that truly Hellenic sense of life flowed more powerfully than ever through the breast? Alongside many temples, camps arose; the four great contests, like those at Olympia, were even specifically called "sacred." Here one truly had a form of divine worship, though, if possible, one even less mystical than that of votive offerings, and in a sense, not a complete one; For this reason, people were still too conscious of dealing solely with human inventions, no matter how much they tried, for example, at Olympia, to convince themselves that every type of competition they introduced was actually ancient, of semi-divine origin, which was being recalled. The gods they imagined in this context also had to be human and humanly sentient beings, and here the highest conception of that humanity was by no means excluded. Indeed, their majestic seclusion readily permitted a truly sympathetic participation in everything that interested man, albeit a participation full of gracious majesty and heavenly tranquility: not only sympathetic humans, but also sympathetic gods, the Greek had as spectators in all his enjoyments and endeavors. This could put him in a sacred mood; Many times, when he yielded to a noble human impulse for pleasure, when he glowed with enthusiasm at the sight of beauty and strength, when his healthy nature roused him to exertion, he felt himself, as in prayer and sacrifice, brought into a closer communion with the immortals. But nowhere was that feeling aroused more powerfully than by the contests and the display of splendor and power, which were deliberately dedicated to the Deity. And now in Athens — the festival of the Plynterie had to remain as it was, until it fossilized in its old forms; however, at that of the Panathenaia, the number of contests was expanded, and the procession was given a new organization. Even in the time when only the chariots and beautiful horses of the nobility accompanied the peplos and mysterious objects of the arrephores to the castle, the Gods were undoubtedly expected to observe such beauty with the deepest interest. Now, however, the purpose of the procession—to bring the Goddess her own—is fading into the background. The main goal becomes to display all the splendor and beauty in which the city so dearly delights, before the eyes of the immortal Gods, and first and foremost, before the City Goddess herself. The peplos is more than ever a magnificent piece, especially at the great Panathenaia; these too were almost as much to be made to shine in the procession as to be presented to the goddess; we do not know since when, it was spread from the mast of a ship moving through the streets. And in all this, we vividly feel that the old little house of Erechtheus, in which, besides the old idol, through numerous things, partly mentioned above,1), for example, the fountain of Poseidon and Athena's olive tree, the wonder of religion, above all, forced itself upon the spirit, could no longer satisfy. Old festivals, such as the Plynteria, were added to this; the newer religious mood demanded a new place of worship. Now, the unevenness at the highest point on Athena's hill was leveled by inserting limestone, thus forming a foundation for a new Doric temple. Whether the statue for that temple was ever actually made, we do not know; however, it could not have been intended to create anything other than a conscious depiction of the Deity,

in the spirit of modern sculpture. Only now would the glorious procession end in a glorious divine dwelling, one where one would breathe in the new atmosphere of religious sentiment. Curiously enough, the peplos was actually intended for the wooden statue in the Erechtheum, but the offering of that garment had now become so much of a side issue that the procession carrying it would not end there. It would then, apparently, have to be brought later to the Goddess in the Erechtheum. The procession would, as always, have to offer the great sacrifice at the great altar in the castle; however, it went without saying that many sacrifices would also be offered in or near the new temple. Above all, however, the victors in the contests—this is highly likely, though we do not know for certain—would have had to stand in that temple before the statue of the Goddess, the giver of victory, at whose magnificent feast they had acquired their great fortune. Perhaps the awarding of victory was meant to take place there more as a religious ceremony, after the undeniable crowning of the victors had already been conferred on the camp site itself immediately after the decision had been made; indeed, this also occurred here, although the material rewards in the form of several jars of oil were still received.²) Thus, temple was placed beside temple, a renewed form of worship alongside an old one. The re-creative power of that Hellenic paganism was astonishing. In the Christian world, perhaps only the monasticism of the Catholic Church, which also repeatedly managed to rejuvenate itself in new orders, offers a similarity. One religious creation rose alongside the other, without excluding them. In the holy places of Greece, the various religious worldviews of the centuries were seen side by side in various monumental remains.

The Athens of the tyrants was undoubtedly resplendent and magnificent, and yet the Athenian felt all too keenly that this glory was not truly his own. He was deeply wounded in his self-esteem, and half a century of a generally wise and moderate monarchical government was unable to reconcile him to the existing situation. What was the splendor of the Panathenaia for him, where no one held a place except that assigned to him by the tyrant? In the eyes of the Castle Goddess herself, one appeared there as dishonored by slavery. — Hipparchus, one of the two sons and successors of Pisistratus, was led by his particular enmity towards a distinguished young man, Harmodius, to shamefully deny his sister the honor of carrying a basket in the Panathenaia, of being a canephora. Harmodius and his friend Aristogiton plan to kill the two tyrants at the feast. They succeed only halfway. Hipparchus falls, but Hippias, through his swift and courageous action, manages to save his rule and his life (514 BC). Harmodius and Aristogiton, however, "the tyrant-murderers," were still revered by distant posterity as the heroes of freedom.

The bloodstained family of the Alcmaionides still stirred. The years seemed powerless to erase the stain of the murder of Cylon's followers. They had, as we noted, already returned to Athens in Solon's time; but had they really had the right to do so? No family felt more detached from the old, sacred tradition of the nobility than this one; how could those who had so horribly violated the old, sacred right have derived any prestige from it? They often felt abhorred by the people and were well aware, though they might have tried to pretend otherwise, that every intimate bond with the Deity had been broken. What could they rely on but their wealth and boldness? Megacles, the party leader pushed aside by Pisistratus, had later joined the noble party under Lycurgos, his former opponent, to expel the tyrant; then allied with him again to bring him back and share some measure of power. However, soon realizing that, after having made use of his services, one could not maintain close relations with him, the bloodstained one, he had become one of the principal agents of Pisistratus' second expulsion. When he later returned, he was forced to flee the country along with many others. Years have passed, and now his son, from his marriage to the daughter of the tyrant Clisthenes of Sicyon, also named after him, is plotting ways to return to the city and make Pisistratus' son realize that the despised Alcmaionids are still to be feared. The temple of Delphi had been burned down and, thanks to the Alcmaionids' money, had been restored more magnificently than would have been possible without it; that Delphic sanctuary could serve! Through Sparta's influence, the rule of the tyrants had come to an end everywhere in the Peloponnese, undoubtedly including in Sicyon, the city where Clisthenes' grandfather had ruled. The Delphic god then incessantly reminded the Spartans that it was their solemn duty to free the Athenians from their tyrant; it was the influence of the Alcmaionids that had brought this about. It was even believed that they had bribed the priesthood to do so. Hippias was the Spartans' guest, but religious duty prevailed too strongly; he was driven out with the help of a Spartan army. Clisthenes returned to the city after an absence of at least thirty years (510 BC).

Will the despised family now achieve prominence there? Like his father, the old party

of the nobility stood in his way, now under Isagoras, as then under Lycurgos. If his
77200 father had sought support from the middle class, he was able to marshal the popular
force against his enemies even more effectively. The family then evidently felt even
more outgrown by the authority of the nobility than the former; moreover, it was
primarily the nobility itself that was being sidelined by a monarchical regime like
77205 that of the Pisistratidae. Clisthenes understood that one could now take a
significant step further on the path of democracy. He introduced a new division of
the population according to the hamlets (demen) in which people lived, then numbering
one hundred, while ten hamlets were again united into a tribe (phyle), so that there
were ten tribes (phylen); hamlets and tribes received their own sanctuaries and
sacrificial ceremonies, so that even now the state did not deny its religious
77210 character. The old tribes, phratries, and lineages were not abolished; here too, the
new was juxtaposed with the old; but all political significance was transferred to
the new administrative districts; for example, the Council, established by Solon,
would henceforth consist of five hundred members: fifty from each of the ten new
tribes, no longer four hundred, one hundred from each of the four old ones. From then
77215 on, one was considered a citizen when one was registered on the lists of the hamlets,
no longer by being admitted to the ceremonies of the nobility.
Democracy was also confirmed in other ways; among other things, the well-known
ostracism (shard court) was introduced. The bloodstained one had dared what almost no
one else would have dared: he had broken with such an ancient, sacred tradition as
77220 that of the Ionian national division. The nobility was utterly defeated. One could
attend his sacrifices; one could also refrain from attending; in any case, this no
longer held the state together in its constituent parts. One could have one's child
with the phratries indicated; it was of no concern to the state whether they did or
did not do so. The nobility had excluded numerous people, probably precisely the most
77225 turbulent, whose citizenship was questionable, from citizenship by not allowing them
to attend the sacrifices: they now appeared on Clisthenes' lists in the hamlets. From
the people who attended their sacrifices with pious attention, the nobility had
formed its party; the political organization had immediately been an aristocratic
party organization. It was ensured that the new division would never become anything
77230 like that; not ten adjacent hamlets (demen), but often the most distant ones were
united into a single tribe (phyle); the various larger social circles of neighbors,
in which one or another could easily gain a significant following, were divided over
several administrative districts. The Attic people had enthusiastically followed the
bold Alcmaionide, even though he had led the way in something they themselves would
77235 likely have dreaded. Now, for the first time, they felt completely freed from the ban
of the nobility. They breathed freely in the glorious consciousness of their
independence. What task in the world was too heavy for a people so conscious of their
strength?

Old aristocratic Sparta was startled by the tide it had helped unleash. It had once
77240 begun to extend its guardianship beyond the Peloponnese to the Attic lands as well,
and just as it had first driven out the tyrant, it now acts as an upholder of divine
right; understandably, Isagoras had a hand in this. A Spartan herald arrived in
Athens to demand the expulsion of the descendants of those who had murdered Cylon's
followers. Clisthenes and a few others were forced to leave the country; Even after
77245 more than a hundred years, the great-grandson was persecuted by the bloodguilt of his
great-grandfather. A Spartan army entered the city; the rule of the nobility would be
restored, much as it had been before Solon. Seven hundred families, naturally the
most democratic, were expelled from the country.

Was democracy merely a matter of demagogues, and would the people, deprived of their
77250 leaders, willingly submit to an aristocratic order, such as they had not known for
more than eighty years, since Solon's legislation? The Council, established by the
legislature, refused to be dissolved. This signaled a resolution; a center appeared
around which all could rally. The stream of people converged from all sides;
aristocrats and Spartans fled to the castle; they were besieged there and were
77255 quickly forced to surrender. All those who had fled, including Clisthenes, returned
to the city. It was understood that the fight for freedom would now truly begin.
Sparta would return with its aristocratic allies; one felt the eyes of all its old
enemies upon it. How could the noble merchants of Aegina on the west side of the
country remain indifferent to what was happening at Pallas's Hill? How could the
77260 aristocrats of Thebes on the northern border? How could the wealthy nobility of
Chalcis, with its magnificent stud farms, on Euboea, opposite the eastern coast?
Where would they look for support? The Persian Empire had replaced the Lydian. The
Alcmaionids had previously been in contact with the latter. We are not told, but it
was presumably they who advised the Athenians to seek support from the formidable

- 77265 Asiatic empire, which then stretched from the Nile and the Mediterranean Sea to distant India. An embassy departed for Asia Minor. The Persian satrap there was willing to assist the Athenians, provided they sent the king earth and water as a token of submission.
- 77270 This condition was accepted by the envoys; despite such an outward incorporation into the great empire, one could, after all, remain relatively true to oneself. This was perhaps the boldest feat of Alcmaionide policy, or that emulated by the Alcmaionides; the first organized democracy the world had seen would be safe in the shadow of the strictest Eastern despotism. Now, however, even those for whom politics was merely a game of shrewd calculations proved to have been mistaken about the most
- 77275 important factor in their alliances: namely, the people they had summoned to freedom. The significance of such an embassy seemed to become fully clear to the Athenians for the first time: they rejected such an agreement with indignation. Half a century of tyranny had not made people forget what they owed themselves as Greeks. How could they want to give up to the barbarian any of that freedom they were so unspeakably
- 77280 happy to have regained from the tyrant? Shortly afterward, Clisthenes was again into exile.
- 77285 There stood the Attic people alone, alone with their ideal spiritual drive, with the noblest self-esteem that man can cherish, alone, but under the protection of the gods, whose sanctuaries were everywhere to be seen, shining especially conspicuously from the city's fortress, where the Patron Goddess herself had established her seat. From the east approaches the mighty colossus; on the coasts of Asia Minor, on a few islands, tyrants have been appointed, who, like petty kings among the great, bend the necks of the free Hellene; gradually they will advance, and soon the Attic coast must be reached. On the landward side, too, across the Hellespont, its mighty arm extends
- 77290 slowly but surely; numerous places are occupied, Macedonia is encircled, one is knocking at the gates of the European Hellenic land. And in Attica's more immediate surroundings? Peloponnesian, Theban, and Chalkidian aristocrats summon their men to battle; armed Aeginite warships could invade the Attic ports at any moment, and amidst all this, a people of surely no more than twenty thousand fighting men holds aloft the standard of freedom, the standard of man's high right to live free from the
- 77295 oppression of his fellow man.
- 77300 The Peloponnesian army stands on Attic territory in the west; in the north, the Thebans, in the east, the Chalkidians, have crossed the border. The first to act is against the Peloponnesians. Here, however, the power of the principle for which we fought aided them. The Peloponnesians themselves, aristocrats though they were, cherished freedom; relatively recently, several of them had been freed from their tyrants; Now that they were facing the Athenians, their courage failed them, confronting these rulers, whom they had no wish to impose. The Corinthians were the first to leave the army; even one of the two Spartan kings refused to continue; the
- 77305 expedition had to be abandoned. The Athenians then proceeded to chastise Chalkis for its simultaneous invasion. The Boeotians attempted to come to their aid but were repulsed across the border. On the same day, the Athenians crossed the sea and the Chalkidians were also defeated; the landed possessions of the Chalkidian nobility were distributed among Attic colonists (cleruchs).
- 77310 Once again, the Boeotians crossed the border, pressed hard by the Athenians, and called upon the Aeginites, Athens's long-standing enemies, for help. These landed, devastated Athens' principal port, Phaleros, and the coastal regions. At the same time, another attack from Sparta was threatened. Hippias was present. What happened in Chalcis showed all too clearly what one feared from the youthful democratic
- 77315 arrogance. Sparta would so forget itself that it would bring back a tyrant to a Hellenic city. However, this proved impossible. Once again, at the behest of the Corinthians, the undertaking was abandoned, despite Hippias's warning of the danger that unbridled Athens would pose to all of Greece. Some time later, Hippias went to the king of Persia, his natural ally. This time, Athens was saved. They even came to
- 77320 a relatively good understanding with the Peloponnesians. However, relations with Aegina, in particular, remained very tense.
- 77325 With what a different feeling one could now ascend to the city fortress for the festival of the Panathenaeans! Only now had that festival become entirely the Athenians' own festival. No tyrant anymore inquired of a free citizen whether he carried a sword. Harmodius and Aristogiton seem to have hidden theirs among the leaves of a myrtle branch, which, in the hand of the celebrant, would not arouse suspicion. "With the sword in the myrtle branch," they now followed the procession, and a song proclaimed that they did so in imitation of those heroes, "when they slew the tyrant and liberated Athens." "Dear Harmodius," it continued, "you are not dead,
- 77330 you live on the islands of the blessed with fleet-footed Achilles and excellent

Diomedes."1) A detachment of handsome old men, each with a branch in their hand (Thallophores), also participated in the procession. Beforehand, a contest was held among the ten tribes of Clisthenes to determine who could present the most handsome old man (Euandrie). In a similar manner, the honor of participation for other participants no longer depended on the whim of a single individual. Cases like that which had befallen Harmodius' sister were no longer to be feared. Now, for the first time, it was truly an image of the Attic people in their full glory that presented itself in the procession of the Panathenaeans of the goddess.

How vividly, in all this, the consciousness of being Athenian spoke. Unlike the tyrants, they had shown themselves unwilling to relinquish their dignity as a Hellene; in a particularly close bond with one's Ionian kin; yet, one held the conviction that one was, or at least could be, different and better than them, and that one should be so. The Solonian legislation—not abolished under Pisistratus and his sons, especially regarding provisions such as those mentioned here—had instilled in the people for almost a century. Clisthenes had also cast aside the old Phratric tribes because it was an Ionian division; as protective demigods for his ten new tribes, he had deliberately chosen demigods from non-Ionian legends: the Athenian was Pelasgian, was Indigenous, not Ionian. This increasingly became a well-established popular opinion, and there was about as much basis for it as if, for example, an Englishman were to call himself more Anglo-Saxon than Norman. It was a precious awareness for a people to belong to an age-old state, to have, as it were, grown together with the soil of their homeland; this gave a certain stability and steadfastness to customs and ways of thinking; the sense of national unity was strongly confirmed by it.1) The Ionians, whose cities were colonies, lacked all of this. Entirely in the spirit of Solonian law, the Attic men, now or a little later, abolished the custom of wearing long linen garments in the Ionian manner, of rolling their hair into a bun, and of piercing it with elaborate hairpins to keep it together. Such matters had a completely different meaning for a people who so little separated the inner from the outer than for us.

Thus, the Attic people became more and more themselves. Today, too, we encounter an Attic art that had already acquired a very distinct character of its own. Indeed, several ancient Attic painted vases, or fragments thereof, have been found that date to approximately this period. The large mixing vessel, for example,—seventy centimeters high and roughly as wide, made according to the inscription by Clitias and Ergotimos and found in 1845 by François—is the most famous example; eleven scenes are depicted on it in six rows. This Attic vase painting is the successor, above all, to an Ionian one, namely that of Chalcis.1) As on the battlefield, Chalcis was also defeated here. First, Attic artists more completely freed themselves from all vestiges of oriental influence; Chalcis vases, for example, often still have numerous rows of Asiatic animals, while Attic ones omit them more; François's vase has one, along with ten with genuinely Greek mythological scenes. All further situations are generally more clearly perceived and rendered, even today with a certain sharpness, as one wanted to bring clearly to the eyes of others what one was consciously aware of having truly seen for the first time. On one of the most beautiful Chalkidish vases, for example, one sees a couple of cows; don't look too closely for the connection between the tangle of legs and the bodies; that vase painter didn't take that so seriously. An Attic artist, however, wouldn't be satisfied with that. They also have a much more vivid sense of what can and cannot be accomplished with the given resources. Drawing on vases, as we know from what has already been said about it, was a silhouette drawing with some, only minor, further elaboration of the figures by means of crayons. It was therefore highly recommended to use the figures in profile. The Chalkidish vase painter, however, is not sufficiently aware of this. So, to take just one example from many, on one of the most beautiful Chalkidian vases, a warrior is positioned in such a way that his face and face are visible. That in itself is quite manageable, but what about the helmet's crest? How could it be drawn from the front, primarily with a little black paint, so that one could tell what it was? They knew no other way than to give one helmet two crests, both seen from the side. Among Attic artists, however, the desire to compose scenes in such a way that such difficulties could be avoided is very clearly revealed. This may have required effort, but they undeniably learned to master the material better and made greater progress in their art. Through a very simple, yet precisely for that reason so striking, invention, they later also managed to expand the means of their art. The black figures on the red vase surface were still an imitation of the old metal fittings on a wooden base. They did not yet have their own style for vase painting.

The Attic vase painter now simply turns the matter around: instead of painting black figures on the red surface of the vase, he makes the entire vase, or the part

intended for the drawing, black, the figures, retaining the black varnish, these now became red on a black background, just as they had previously been black on a red background. This now makes the figures appear much clearer and more beautiful, and their interiors could be much better developed with a brush and black paint than previously with crayons. One now has much more freedom in one's drawing. Deep perspectives were still out of the question, but the surface of a vase, which in our perception always remains a plane and therefore wants to be decorated as a plane, is not really the place for it.

Athens also apparently came much more to the fore in monumental art at that time. We hear the names of Antenor, Amphicrates, Hegias, Critius, and Nesiotes. The former created a group of the two tyrant-murderers, as did the latter two together. Thus, art was immediately nationally inspired. We can gain some insight into the tyrant-murderers of Critius and Nesiotes from later imitations and depictions on coins; both men charged toward their target with courageous courage. We also have some remains of sculpture from approximately that period, but we lack the data for a comprehensive assessment of the oldest Attic sculpture.

(To be continued.)

The Attic people and the art of Phidias. III. (Continued from Part II, p. 312.)

Attic democracy was, at its origin, a love of freedom and a sense of self-respect. The community demanded space for itself and displaced the nobility, but this displacement was more a means than an end. No desire for equality was the great passion here, nor did the glory of governing and judging itself shine primarily in the eyes of the Attic citizen. The city's princes were distrusted to the extent that they believed they feared their lust for tyranny, yet they could be seen without envy as the chosen ones of the community at the helm. As always, the Athenian remained sensitive to the grand splendor of the nobles' lives and to the allure of distinguished manners and noble innocence. About eighty years later, the comedian Aristophanes poked fun at a wealthy Athenian citizen who had taken the pleasure of marrying a destitute noblewoman. The grand noble names, such as Xanthippos (yellow horse), Hipponikos (conqueror with horses), long retained a certain appeal. A party of the old nobility continued to cling to its lost rights. No wonder, however, that many others learned to adapt more or less to democracy, which at least offered them more room for their ambition than the rule of tyrants. Nevertheless, it is indicative of the situation that the first statesman who seized the young democracy and led it was a man whose father belonged only to the less distinguished nobles, yet who, above all, had often deeply felt the consequences of his illegitimate birth from a non-Hellenic mother. It was Themistocles, the son of Neocles. The Greeks recounted all sorts of examples of his childish tendency toward self-aggrandizement and a burning, common-sense, yearning to shine and gain prominence. At Olympia, for example, he attempted to outdo Kimon, the son of Miltiades, with pomp and splendor, with beautiful tents and splendid banquets. What the Greeks considered entirely appropriate in the highly noble youth, however, repelled them when it was imitated by a roturier. But the roturier was a man of genius. The qualities by which he made himself felt were an almost unparalleled cunning, a boldness and foresight that consistently managed to achieve what, in the end, proved just as attainable, and an originality that mocked all the calculations of his opponents. No statesman ever possessed—Thucydides¹) already admired him for this—the gift of foresight to a higher degree. He was fully aware of his ability, and all that petty and childishness was the bastard offspring of the statesman's natural ambition. Push a Themistocles off the stage of government; you might as well wrest the chisel from the hands of a Phidias. Was he enthusiastic about democracy and Hellenism? He was not, first and foremost, a nature to be enthusiastic. His circumstances connected him to democracy, but above all, he was one of those statesmen who, without much prior reflection on their desirability and justification, accept the currents of their time as they are, to see what, with good leadership, might be made of them in the interests of their state, and whether therein lies a field for their activity, where they can fully demonstrate who they are and what they are capable of. For von Bismarck, in many ways Themistocles' spiritual twin brother, the German unification movement was the means to the upliftment of the Hohenzollern; the Attic statesman understood how democracy and the struggle against the barbarians could leverage Athens' greatness. The movement against the tyrants in Europe was countered in the Hellenic region of Asia Minor. The tyrant of Miletus, Aristagoras, on hostile terms with the Persian

court, knew no better option than to place himself at the head of the liberation movement; in his own city, he voluntarily relinquished his authority; in numerous other places, he drove out the tyrants appointed by the king of Persia. He counted on the help of Sparta and Athens, and the latter city, in the youthful sense of its newly acquired freedom, actually came to the aid of the Ionian kin. The same applied to the inhabitants of Eretria on Euboeia. Aristagoras's venture, however, failed. The Persians once again confirmed their authority on the coasts and islands of Asia Minor and the European lands beyond the Hellespont. They then continued their advance, this time to subdue Greece and to chastise the Ionian allies. This time (493 BC), it was impossible to penetrate this far. However, everyone could understand that new attempts would follow.

Next to the roadstead of Phaleros, Athens's principal port, a rocky peninsula of irregular shapes jutted out, with two small and one large inlet, all three very narrow at the entrance, but widening further, while being flanked by a higher and lower hilltop. The largest inlet and the entire peninsula bore the name of Peiraeus. There is a story that the ancient Epimenides of Crete, upon noticing the fortress heights of Mounychia, the highest of these two hilltops, pondered for a long time, but then predicted to the bystanders that great evil awaited the Athenians from that place. Similarly, Themistocles foresaw what that hilly peninsula with its three indented bays could become, and there, as it were, the entire Athens of the future rose before his eyes. A well-fortified Peiraias could be the safest harbor and the most impregnable fortress in the world. The sturdy Attic citizenry, as it then was, animated by the fire of freedom, undoubtedly formed a land army that could even be called honorable alongside that of Sparta; but at sea, it could be utterly irresistible. Athens could become a maritime power that would far outshine Aegina, Corinth, and every other Greek maritime state. Their fleets could sail from and return to those inaccessible harbors, from whose narrow entrances any enemy ship could easily be barred. Should they be attacked by their enemies from the land side, the entire population could find a safe refuge within that fortified harbor. Provided the walls were built high enough, it could easily be defended by a few weak men, so that almost the entire able-bodied force would remain available to the fleet, and the enemy would therefore have as much to fear as ever. There was, of that there was no doubt, a major Persian campaign was imminent. The great king could command hundreds of thousands; but a Persian land army would hardly be able to carry out its task without a fleet. A Persian expedition solely by sea was conceivable, one solely by land very difficult. At sea alone could the Persian be permanently defeated, and what future lay in store for Athens if all of Greece had to bear witness that its naval power had, first and foremost, broken the yoke of the barbarians?

And without a doubt, the vision of the seer—for that was what he was, albeit one in a completely different vein than the old venerable Cretan—reached even further. The sea had created democracy; the sea would make it great. The core of the land army was formed by the more affluent as hoplites (heavy-armed troops); the vast majority belonging to the lowest of Solon's classes, those who owned no or a very small piece of land, were excluded from the honor of serving as hoplites. No distinction was seen in naval service; such lesser men, it seemed, were precisely in their place. If the fleet now gained the upper hand, the preservation of Attica, perhaps even of all of Greece, would largely depend on these lesser citizens. Since Solon, Athens had developed greatly as a trading state; undoubtedly, this measure of the soil's yield excluded many well-to-do, even somewhat wealthy, citizens. However, there were fears about the restlessness and the sometimes excessive freedom of thought from tradition, which, as experience had shown, were fostered by maritime traffic; the state had to rely primarily on these sedate citizens, who were more attached to the existing order. Themistocles' policy ultimately triumphed completely, but that victory was still lamented by the ancient Plato more than a century later.[1] This also explains the prediction, rightly or wrongly attributed to Epimenides. During Themistocles' archonship (in 493 BC), work had already begun on fortifying the Peiraias. However, the work was halted again.

Meanwhile, the danger threatening from Persia drew ever closer. The great king's envoys marched through the cities of Greece to demand land and water as a sign of submission. Several granted it. Sparta and Athens refused. Among those who had submitted was Aegina.

What could have motivated the proud island of the Aikides to do so? An ally of Sparta, a nation powerful through its fleets and wealth, excelling almost all others through its heroic deeds at the camp of Olympia, surrendered to the barbarians at the first summons. Was it to be assumed that this state intended to do what the Athenian citizenry had so indignantly rejected shortly before, namely, ally itself with the

mighty Persian Empire against its Hellenic neighbors? The danger threatening them was
 77530 appalling. From Aegina, the barbarian fleet might invade the roadstead of Phaleros.
 The Athenians complained to Sparta, considered the natural head of Hellenism.
 However, the friends they had in that city at that time knew nothing more than to
 hand over some prominent Aeginetans to them. After Aegina had vainly demanded the
 extradition of these people, the Aeginean fleet suddenly attacked the Athenians while
 77535 they were celebrating in southern Attica, and in retaliation, several prominent
 Athenians were taken to Aegina. The danger that constantly threatened from this
 western neighbor was now felt more vividly than ever; one was not safe for a moment
 in one's own country. There was no resting on one's laurels. Aegina had to be
 punished. But how? Their own naval forces were insufficient. However, they managed to
 77540 obtain twenty ships as a gift from the Corinthians, made secret alliances with the
 democrats of the island, and bravely attacked the powerful enemy. War had broken out.

There, however, the long-awaited storm was truly approaching from the east. A mighty
 fleet was carrying a large army. Hippias was with the barbarians. Those who had
 77545 refused water and land would now be subdued by force. The king had given firm orders
 that the Athenians and inhabitants of Eretria on Euboea be taken captive to Persia.
 The enemy fleet approached from island to island. There they landed on Euboea.
 Eretria went up in flames; its wretched population was taken captive. The barbarians
 stood on Attic soil at Marathon (490 BC).
 77550 The Athenians deeply understood the gravity of the moment. They were convinced that
 they had much that was great and noble to defend, along with their national
 existence. However, no one could fully grasp what was then at stake, even for
 posterity. The question was whether the noble Attic people would produce its
 Sophocles, its Phidias, its Socrates, its Plato, or whether, languishing in a
 77555 forgotten corner of the vast Persian empire, it would be no more than, at best—
 preserved from utter ruin by a quirk of fortune—an ethnographic curiosity, a strange
 national relic amidst entirely different tribes.2).
 What high interests, then, were those ten thousand heroes fighting for, who dared to
 face the formidable Persian army? Themistocles was among them, and the noble
 77560 Aristides; but the main leadership was in the hands of Miltiades, the son of Kimon, a
 haughty nobleman of great military experience. He belonged to a family that had
 acquired an independent principality among the Thracians, at a time when the tyrants'
 rule offered the Athenian nobility no sphere of action; there, too, he had ruled and
 fought; there, too, he had come into contact with the barbarians. He could boast that
 77565 perhaps no Greek had been as dangerous to the king as he. The prestige of his highly
 noble house was great; the husband of a Thraian princess felt a considerable distance
 between himself and the circles of the people, but what a new splendor it gave to his
 old nobility to stand as leader of the Greeks against the barbarians!
 The ten thousand were victorious. The immense army fled to the fleet. This fleet,
 77570 however, sailed around Attica to attack it from the west. Onward from the fields of
 Marathon, to obstruct the enemy there as well.

Already the barbarian fleet comes into view, directly opposite the harbor of
 Phaleros. Suddenly, however, it turns away. Did the barbarians lack the courage for a
 77575 second battle when they once again saw the enemy arrayed against them on the coast?
 What a triumph, at what a camp! No long line of victors at Olympia could bring such
 fame to a city. Ancient Sparta, too, was full of recognition for the heroism
 demonstrated.
 And what were the consequences of this victory? The fear that had so long plagued
 77580 them was now completely removed from their souls. Would the barbarians ever dare to
 return? Through the might of the Attic heavy-armed men, it was believed, Athens,
 indeed all of Greece, had been freed forever from the danger that threatened from
 that side.
 Had not Themistocles also been defeated by Marathon? The ever-calculating,
 77585 deliberating, and weighing statesman saw matters quite differently than the people,
 enraptured by victory. The decision that had brought the triumph of Marathon was not
 one the great king would accept. The vast empire had not yet exhausted all its
 resources. The barbarians would return, and they could not be defeated by heavy
 weapons alone. Under the circumstances, however, it was advisable not to discuss
 77590 this. Continuing the construction of Mount Peiraieus was out of the question; but
 perhaps something else could be achieved. War with Aegina was still on the verge of
 collapse. After some initial victories, defeat had been suffered. Would the brave
 Attic people prove powerless against this enemy? Themistocles proposed that the
 surplus produce from the silver mines of Laurion should no longer be divided, as had

77595 been done up to now, but should be used for shipbuilding.
Here, however, Aristides, a man of great influence, stood in his way. That he possessed this undoubtedly reflected honor on the Athenians, as he sought to assert himself through nothing but better insight, a deep sense of justice, and a pure enthusiasm for the beautiful and the good. He was by no means an unruly conservative, but he shuddered at all leaps into the unknown, above all at any less than gradual progress on the path of democracy. Therefore, he opposed Themistocles' plans, which he fully understood would lead his people to an entirely new future. Themistocles, however, was victorious. With all the youthful resilience of a newly awakened sense of self, the Attic citizenry set to work; for wealthy people, it was a point of ambition to contribute large sums from their own resources. Aristides was banished through ostracism. Themistocles thus gained complete control of the people, and understanding that it would be unwise to ask for too much at once, he repeatedly proposed building more ships, thus gradually placing the Athenians in possession of a large fleet.

77600 There, approximately a million Asiatic warriors approached (480 BC); a bridge was built for them across the Hellespont; twelve hundred ships followed this immense army along the coast. How could Greece resist? Hellenes versus barbarians—that was one of the most familiar ideas; but had a united Greece ever actually faced a foreign enemy, except in the ancient period of the Argonaut expedition and the Trojan War? Hellenism was still unorganized. The Spartan alliance in the Peloponnese comprised relatively few states. How many feuds and disputes also divided the various tribes? Would it become apparent, once the barbarians actually approached, that Hellenism did not actually exist? Several Hellenic states had already submitted to the enemy, who had sent envoys ahead for earth and water. The cause of Hellas's freedom seemed hopeless.

77615 It was the great Attic statesman on whose broad shoulders the future of the entire Hellenic homeland now seemed to rest. He, above all, organized the resistance against the enemy. Disputes were settled; Athens reconciled with Aegina. On his advice, the city of the Marathon victors willingly placed itself under Spartan leadership. The Spartan confederacy in the Peloponnese was extended to all those who had the courage to stand up for their dignity as Hellenes, even in that fearful era. Sparta's brave men fell at Thermopylae. The immense host poured down upon Greece and approached Athens. It was the mighty hand of Themistocles that managed to drive an entire population out of their homes. One had to leave one's sanctuaries in the hands of the barbarians; one must risk whether one would even stand under the protection of the Immortals outside one's ancient, sacred territory. The Peiraieus, still unfortified, offers no refuge. Women, children, and old men flee to Salamis, Troyes, and Aegina—who would have thought such a thing possible a few years ago?—the men hide behind the wooden walls of the fleet. From Salamis, the city and the shrines of the fortress are seen going up in flames.

77635 The Persian fleet appears at the roadstead of Phaleros. The Greek fleet has retreated not far from there, between Salamis and the mainland. Great discord reigns on the latter. The Peloponnesians want to leave the place to defend their peninsula alone. Themistocles holds them back with difficulty. News arrives that the Persian fleet is approaching. Very few knew then that the king, through a ruse of Themistocles, had been induced to attack the Greeks there in a narrow strait, terrain so much more suitable for their smaller fleet, and thus force them to unity. What a result his efforts were crowned with: the Persian fleet was defeated. Most of the Greeks had behaved better; above all, the Aeginites wanted to erase the stain they had brought upon themselves by their initial submission. However, no one could reasonably doubt that the victory was primarily due to the city, which ten years earlier had been forced to request twenty ships from the Corinthians to defend itself against a Greek enemy, but which had now deployed a fleet of two hundred ships, more than half of the entire Greek naval force (372 ships). What a reversal in the space of thirty years; the proud Chalcidians of old had fought alongside Athenian ships.

77650 The king left the country, leaving only a portion of the army, three hundred thousand men, under Mardonius; the Persian fleet also withdrew from Greek waters. It was later learned that another ruse by Themistocles had been the cause of all this. However, under his command, the Attic fleet set sail to rule the seas between Asia and Greece; the islands that had joined the Persians were forced to pay a fine. If only the Attic navy would maintain control over this, the route by which the Persian fleet could return to Greece would be blocked.

77655 However, Mardonius and his large army were still in Greece. Athens was once again occupied by the barbarians; the barely returned population had to flee the city once again. The work of destruction was now completed; only a relatively few houses remained standing.

77660

The king was also determined to vigorously maintain his authority over the Greek coastal cities of Asia Minor. Of all the troops with which he had returned from Greece, the majority had perished from hunger and disease; but there was still a significant reserve army there, capable of holding the Greeks of Asia Minor in check, while a substantial fleet lay off the coast to repel any attack from that side. Mardonius' army, however, was all but destroyed at Plataea; he himself was killed. On the same day, it is said, the Asia Minor reserve army was utterly defeated on the promontory of Mykale, and the Persian fleet, along with its fortified landing place into which it had taken refuge, was burned. At Plataea, the Athenian land forces under Aristides had contributed at least as much to the success as those of the Spartans; that the victory at Mykale was primarily due to the Athenian fleet could not even be doubted. The Persian army consisted of courageous, tactful men, but those vast, shapeless masses of warriors, so to speak, nameless, were no match for men so powerfully developed and of such high moral character as these gymnasium champions, who were never for a moment disoriented by the consciousness of competing, just as they did on the racecourse at Olympia, under the eyes of their fellow Greeks. They undoubtedly owed much to their superior organization and equipment, but how else did they possess these if not by being Greeks? Above all, however, what a sublime character did the fighting here possess! Just as later, during the Crusades, the most diverse peoples, the most hostile armies, stood united as Christians against the Muslims, so too here, for a high principle, all age-old feuds and all petty ambitions had to be set aside. Man does not maintain himself so easily at such a lofty position. Just as in that heroic age of Catholicism, the fire of internal discord flared up again and again. More than once, this even threatened to destroy the great work entirely.

What bitterness and passion, especially over the question of which nation and which individuals would receive the prize of victory after each battle, for the fight had so completely taken on the character of combat in the arena that here too, prizes were awarded to the bravest. Now, however, Panhellenism (the union of all Hellenes) was at its peak. A spirit of peace and reconciliation spread its wings over the united heroic army at Plataea; it was the influence of Aristides, the commander of the Athenians, that made itself felt here. Spartans and Athenians were on the verge of drawing swords over the question of who would receive the prize for bravery in the battle of Plataea. He prevented any outbreak, and when the proposal was made to award it to the small, brave nation of the Plataeans, he was the first to join on behalf of the Athenians. The storm of passions had completely subsided. The moment was solemn and sacred; concern for divine things, noble thoughts of freedom and unity of purpose completely consumed the soul. All fires in the land of the Plataeans were extinguished; they had been defiled by the presence of the barbarians. New fire was brought from the hearth of Delphi; its world-restorative power was certain. An altar of "the Zeus of Freedom" (Eleutherios) was erected. At the suggestion of Aristides, the territory of the Plataeans was declared sacred and inviolable. Festive envoys from all Greek states would travel there annually; every four years a great festival of freedom (that of the Eleutheria) would be celebrated. The small nation of the Plataeans, admired by all for their demonstrated heroism, yet envied by no one, would be responsible for performing the sacrifices for all of Greece. At the suggestion of the same Aristides, it was decided to establish a permanent Hellenic army and navy for the fight against the barbarians. If ever, then the unity of Hellenism had now become a reality.

But what bustle and commotion reign amid the ruins of Athens! The fleeing population has returned and is restoring its homes and sanctuaries. But behold, walls are also being built, and indeed on such an astonishing scale that, in the event of a new invasion, the entire population of Attica might find a place behind them. Athens' old enemies were alarmed: the Attic people, already so powerful at sea, indomitable in their self-esteem, would ensconce themselves behind high walls, from which they could defy all of Greece. It was Themistocles, Neocles' son, who once again led the way here. His strength was the strength of the entire people; the Athens of his designs was about to be realized. He, too, had repeatedly managed to maintain the bond between the Hellenes, but he believed he knew people well enough to know how much one could rely on the durability of their noblest sentiments. Even in the midst of a united Hellenism, Athens had to ensure its safety. And wasn't it, in any case, her right to fortify herself as she saw fit? Couldn't an Athens with walls render greater service to the Hellenic cause than one without? Even a man like Aristides had to fully admit that.

Athens' enemies, however, especially Aegina, were restless. On behalf of the majority of the Hellenic allies, Sparta demanded a halt to fortifications; after all, a fortified Athens could serve as a base for their operations in the event of a possible return of the barbarians. Themistocles, through cunning, managed to delay the Spartans for a considerable time. Meanwhile, men, women, and children had to work tirelessly. All suitable stones found, worked and unworked, gravestones and stones on which acts were chiseled—we still have some that were dug out of that wall—in short, everything that could serve any purpose was piled up into an irregular, yet strong wall. This was finished before anyone could intervene. The fortifications of the Peiraias were now also completed. Athens, on its ancient, hallowed ground, was untouchable.

With what self-satisfaction could Aegina also look back on the heroic struggle it had endured. After the Battle of Salamis, it had won the prize of bravery, and although everyone knew that such decisions were not always made with the strictest justice, it was above all suspicion that the Aeginetans, as so often at the camp at Olympia, had here also proven themselves the worthy people of the Aeacians. These same ancient demigods, Aiaceus, Telamon, Achilles, Ajax, had been called upon by the Hellenes at Salamis in a very special way, and some believed that their figures were to have seen themselves moving through the air. – When approaching the island from Attica, a platform on the seaward side quickly caught the eye, upon which a temple of Athena had been built. Now, as we know, Aegina, since the time of Smilis, had shone with an unsurpassed school of sculptors. Now, after the heroic struggle, when its powers are felt more vividly than ever, two large sculptural groups are being created for the two facades of that temple, a splendid example of what the sculptural art of the Aeginetes was also capable of. The creation of a work of art was here, as so often in Greece, a national act. On the east facade, one saw a battle between Greeks and Trojans for the body of a fallen man, presumably Oicles, with the Aegean Telamon leading the fight; on the west facade, the battle also between the two peoples for the body of Patroos, with Ajax leading the fight. In both chariot battles, the goddess Athena intervenes, as always in favor of the Greeks. Thus, as soon as the foreigner set foot on shore, the ancient glory of the Aeacids shone in his eyes, who had once again been the forerunners in the renewed struggle between Europe and Asia that had now been experienced.

Significant portions of this work of art have been preserved and are now in the glyptothek in Munich.[1] Undoubtedly, it does great credit to the masters who created it. The striking accuracy with which the bodily forms are rendered and the versatility of postures in which the figures were composed are those of an already highly developed art. The Aeginite sculptures undeniably held a very high place among the works of art of their time.

However, the full light of truly Hellenic art had not yet broken through here. The heads, with their good Assyrian hair and old-fashioned smiles, have lagged behind in their development. A more refined art of grouping, in which the rich diversity of the various parts is only briefly, yet just enough, held together by the bond of symmetry, is still absent. The figures of the gods are highly rigid and conventional. All grandeur is completely absent in both her and the fighting heroes. Moreover, especially in the western gable group, the movements of the bodies, though often tremendous, are not intimately and accurately rendered in the smallest details to create a powerful impression of life. There is, in fact, a significant difference between the two gable groups. The eastern group was clearly created by a younger generation of artists²⁾, who, through continued observation of nature, began to outgrow the artistic tradition honored in the western group. Not only are details like veins and tendons rendered much more accurately—something that immediately enhances the impression of life—but the poses and gestures are also taken from life with much greater delicacy. This is especially true of a dying warrior, who has fallen to the ground, but who still holds his upper body somewhat upright with his shield resting upright on his left arm and his right hand weakly pushing off the ground. This figure is truly expressive; even the conventional smile of the west facade is replaced here by a fairly well-rendered expression of sorrow: the pursed lips are slightly parted at the corners.

However, the Aeginetes were not destined to achieve further victories in this field. It is undeniable that a vigorous development of art usually goes hand in hand with the overall national advancement of a people. Yet we are repeatedly reminded that geniuses are primarily by the grace of God, and thus the great artist who contributed most to freeing Hellenic sculpture from all the barbarism that still clung to it, belonged to Rhegion, in a remote corner of the Greek world, a southern Italian colony

far from the battlefields of Marathon and Plataea, with a population whose cowardice would soon become proverbial. That city had already produced one famous sculptor, Klearchos, a pupil of Skyllis and Dipoinus, and Pythagoras—for that was the name of the great Rhegionian master who now appeared—was said to have been a pupil of this Klearchos. While Greek art from the very beginning had an open eye for nature, Pythagoras was the first to make it a rule that, if one wanted to imbue bodily forms with the expression of life, one must follow it down to the smallest detail. He therefore put an end to Assyrian and other ancient hair treatments; he depicted veins and tendons with great clarity; but above all, he felt that it was the so-called rhythm of movements is what gives bodies their full naturalness, and if one did not want to leave it to chance whether the figures one created would appear animated or not, one had to endeavor above all to reproduce that rhythm delicately and accurately. But what did one understand by this?1) The human body is, so to speak, more of a single whole than an amalgamation of several limbs; all movements of any significance are therefore more or less movements of the entire body, even if they originate in a single limb; the movement propagates throughout the body and produces countermovements. Only when this propagation occurs gradually, without jerks or jerks, does one obtain a movement that, at a single specific moment—and only such a movement can visual art depict—dominates the entire body. Such movements were called "good of rhythm," "eurythmic." The lines of these movements, however convoluted, immediately appeared as a single whole, just as one feels that a line of verse forms a single whole, no matter how different the feet from which it was composed. Eurythmic was the springy gait, full of self-control, of the athletically trained, free Hellene; eurythmic were also highly evocative of the dancer's movements, which emanated from the feet and were conveyed to the entire body, which, in its rhythmic undulations, was, as it were, carried by the rhythm of the accompanying music. A no less striking example, though of a completely different nature, is provided by one of Pythagoras's own most famous works, namely his limping Philoctetes, of which we can gain some understanding from imitations on cameos. It was precisely a subject that tempted Pythagoras to test his strength, a difficult, painful gait to which the entire posture of the body was adapted. Yet even the victors of Marathon were not left behind. The delicacy and loveliness of Kalamis, especially his Aphrodite Sosandra, were striking nonetheless—or rather, more or less so because he clung to the old art form. Of greater significance in the consequences, however, was that Myron from Eleuthera, a Boeotian border town that had joined Attica, a pupil of the famous Argive master Ageladas, dared to enter the arena with the genius Pythagoras. While the master, with his pankratiast (a kind of champion), achieved victory this time, there is no doubt that the movement that had begun in distant Rhegion was carried over to Athens and continued there. Myron, like Pythagoras, studied extensively in the gymnasiums and palaces. His animals, especially his cow, also achieved great fame. We know a few of his works from imitations. First, his discus thrower; he is depicted at the precise moment his discus (disc) is about to whizz away; the entire body is at the height of tension, an indivisible moment before it ceases. Furthermore, we have copies of Marsyas, who recoils from Athena just as he was about to seize the flute she has thrown away. Also very famous was his runner Ladas, who died as a result of his exertions in the racecourse at Olympia; "his breath," according to an old poetic description, "floated from the sunken sides onto the edges of his lips." The position of the lips, in conjunction with the sunken sides and, of course, the flat chest, thus indicated the condition of the runner gasping for breath. These examples demonstrate how effectively Myron, like Pythagoras, was able to express life in coherent movements. However, he went further than this. From what we are told—and what we know of his works is entirely consistent with this—he managed to convey the impression of life in his creations more powerfully than he had observed in nature. Furthermore, in relatively minor details, such as the treatment of hair, he must have been less careful in imitating nature than Pythagoras. Myron was clearly more concerned with explaining nature than with following it, and therefore he did not bother with the minor details of execution, insofar as these were not related to what he wanted to clearly visualize through his works. Although he was not yet an idealist in the full sense of the word, he had undoubtedly already set foot on the path that idealism alone could attain. Myron no longer needed to search for the forms of nature, as Pythagoras had done, but he had already mastered them sufficiently to use them as the material for artistic creations, a fantasy that reached beyond nature. However, the man in whose spirit the unique idealism of Athens was already alive and working lived and worked in Athens.

Attic art would mature. Phidias, Charmides' son, had first tried his luck as a painter, but later, realizing his true calling, he apprenticed with the Attic sculptor Hegias; probably not entirely satisfied with what he learned from him, he, like Myron, had sought solace with the Argive master Ageladas. It is believed that in both his and Myron's art, traces of Ageladas' influence can be discerned alongside that of the earlier Attic school of sculpture.[1] Phidias was still a young man at the time of the Battle of Salamis. However, not long afterward, he created a large group of bronze statues to commemorate the Battle of Marathon, using part of the money brought in by the booty taken there. This group was placed in the temple of Delphi; Miltiades stood there between Apollo and Athena. Another work from the early part of his artistic career was a large bronze statue of the goddess Athena, which was placed on the citadel; this too was likely made from part of the proceeds of the spoils taken in the Persian Wars. No Hellenic people were more closely connected to the Athenians than the Plataeans; they were the only ones who had fought on the battlefield of Marathon; without the envy of the other Hellenes, they would have become fully Athenians by having their territory incorporated into Attica. With the money they had earned as a prize for bravery in the battle near their city, they had a temple built for Athena Areia. Phidias sculpted the statue of the goddess for it. Thus, from the beginning, he was the national sculptor of the Athenians and their most loyal friends, then, so to speak, the sculptor of the Persian Wars, just as the sculptors of the aforementioned Aeginean groups were for Aegina. While these adorned the island's east coast, facing Attica, anyone approaching the Attic west coast, facing Aegina, could soon catch sight of Phidias' bronze statue of the Castle Goddess atop the fortress.

What powerful impressions lived under the generation that had waged a gigantic struggle for its national existence and, in the process, had seen the highest national ideal, hitherto of scarcely any practical significance, suddenly become a full reality. In the powerful uplift of soul, which brought the consciousness of having, according to the noblest promptings of one's soul, dared the unequal battle for the best one knew, one breathed as if in the heavenly atmosphere of the Immortals, by whose help, indeed—one was deeply convinced of this—one had, in the first place, crushed the power of the barbarians. It was the sacred atmosphere of the battlefield of Plataea, and while people often imagined these helpful gods, according to popular belief, as fellow warriors, there was also a special place here for those poetic-philosophical conceptions of a higher spiritual development. They had witnessed the denouement of a tremendous world drama. The ancient struggle between Europe and Asia, already begun during the time of the Argonauts' expedition and the Trojan War, had resumed. Old predictions circulated that the Asian army would perish in an attack on Greece. In his blind arrogance, Xerxes had, as it were, equated himself with the gods. It was not a God1) who marched against Greece at the head of such tremendous armies and such a mighty fleet, who, at the Hellespont, to clear a path for himself, threw a "yoke around the neck of the sea"2), who had the promontory of Athos dug through to grant his ships safe passage! The deceit of the gods led the arrogant man ever further down the path of destruction, once he had embarked upon it. Xerxes' blindness caused those ancient prophecies to be fulfilled more quickly than might otherwise have been the case. The Moira and Atê of the gods3) were the cause of the terrible disaster that had befallen the barbarians.

In this spirit, Aeschylus wrote his "Persians." We know that the poet's religious views were more peculiar to him. Yet, as we have seen, the ideas then generated were connected with more exalted conceptions of the Deity than those according to which the world of the gods formed a restlessly tossed, small-scale human society. The events of the time thus brought the Gods more vividly than ever before to mind as the immense beings who sat enthroned there in tranquil majesty and heavenly calm on Olympus and guided humanity in all its ways, even unnoticed by them. Thus, they also undoubtedly imagined the exalted artist, who seemed chosen to be the heroic singer and hymn-writer of his people in metal and marble. He would attempt to recreate them in that full divine majesty.

To present it to his compatriots and contemporaries as if before their eyes, after the visual artist had hitherto depicted it as a motionless lump or in human activity. The form of the colossus was bestowed upon him by the existing artistic tradition, but he would lose the accuracy of the Peloponnesian sculptors in depicting bodily forms, the relative skill in depicting the garment in its various arrangements, in its folds and folds—which one apparently owed to the Ionian school of art, and the eurythmy of Pythagoras and Myron—he would, in short, take everything that his ancestors and contemporary could achieve in their art, so to speak, as a tool in

77925 their hands, to perfect and glorify it, and to create forms such as these, though
entirely in harmony with nature, were never produced by nature. The path by which
nature was surpassed, taken by Myron through the inspiration of his imagination, was
entered by Phidias with the awareness of a higher calling. This Attic idealism, after
77930 all, was no arbitrary play of the imagination. They were truly existing gods and
demigods who had to be depicted, as people truly believed they were, human and yet
more than human. It is sometimes assumed that in Phidias's first works, the influence
of Ageladas was still quite strongly discernible, and of course, the master did not
immediately reach his greatest heights; yet, the basic concept of his religious
77935 creations is apparently already apparent in that bronze statue of Athena. It was not
only very large, but the martial attitude usually given to the goddess—we know
Phidias's image in its main features from Attic coins—was replaced by one of calm
dignity.

Yet, however, Athens was not what it could become. Themistocles experienced the
77940 utmost satisfaction; Salamis, so to speak, conquered Marathon. Was it possible to
continue treating the Attic sea people, to whom Athens, and to whom all of Greece
owed most of its survival, as less entitled fellow citizens, to whom the interests of
the state could not be fully entrusted? At Aristides's own suggestion, most offices
were opened to citizens of all four classes, according to land ownership. It was one
77945 of those reforms that were inevitable, even if the statesman was not entirely
reassured about their consequences.

Already during the Battle of Mykale, the Ionian troops of the king's army had
deserted; for the second time, the Asian Hellenic lands were in full revolt against
the barbarians. The European Greeks understood that they could not abandon their
77950 kinsmen to their vengeance and deliberated on what should be done. The Spartans,
naturally wary of any daring undertaking, believed it best to have them evacuate
their cities and lands and assign them other places of residence in Europe. Such
cowardice, especially after such victories, was utterly incomprehensible to the
Athenians; they had to maintain their Ionian brethren in their own country despite
77955 all the armies and fleets of the barbarians; abandoning Asia Minor to them was
tantamount to giving them free rein on the path to European Greece. Were those Dorian
Spartans really the right people to decide the fate of their Ionian brethren? What
did they feel for them? Wasn't Athens, already united with them in ancient times in
the Delian League, their natural protector? When the Spartans shortly thereafter
77960 concluded their campaign of that spring, the Athenians continued the fight with their
Asia Minor brethren for a while longer. Meanwhile, as we have seen, renewed war
against the barbarians had also been decided upon at Plataea. Consequently, under
Spartan leadership, a Hellenic naval force sailed once again to Asia Minor. Cyprus
was largely captured; from there, any new naval deployments on the opposite
77965 Phoenician coast could be prevented. Byzantium was taken; by conquering the lands
along the Hellespont, the Persian route could also be blocked there. The Spartan
commander, Pausanias, however, adopted a very haughty attitude and permitted himself
all sorts of violence, especially against the Greeks of Asia Minor. All allies except
the Peloponnesians placed themselves under the protection of the Athenians and
77970 assigned them hegemony. Meanwhile, Pausanias was summoned to Sparta, accused of
treason, and only the Athenians and those who had allied with them remained on the
battlefield. The Spartans made only one more feeble attempt to regain control of the
war. When it became clear to them that this would not succeed, they also abandoned
the war in Asia without much resistance to the Athenians and their allies; after all,
77975 from the very beginning, this far-flung undertaking had been very unpopular with
them. The alliance of Plataea was not considered broken, but why should all the
allies go to war, now that it turned out that a portion of them was entirely
sufficient for waging the war?

The old Delian alliance was renewed. Treasurers of the Hellenes (Hellenotamies)
77980 managed the common funds at the temple of Apollo on Delos. Each of the allies paid
according to their ability; it was the just Aristides who had established this for
each. Not a dominant Hellenism, as had more or less been Themistocles' intention, but
a free alliance of states on equal terms would form Hellas's bulwark against the
barbarians. The leadership of the war fell to Kimon, son of Miltiades, a commander of
77985 swift and bold warfare, acting with the same powerful, audacious impulse that then
animated the entire Attic citizenry. The Ionian allies were forced to acknowledge
him, in his private life, as a carefree, rather unsterne nobleman, almost one of their
own; however, when the time came for action, he was entirely self-possession,
courage, and strength of spirit. He always captivated with his engaging, uninhibited
77990 manner. No one did good on a greater scale than he; evidently, his generosity never

cost him a single victory over himself. It is said that he had the fences of his gardens removed so that his poor fellow citizens could freely gather as much fruit as they chose; daily he held an open table, at which he fed a great many poor people. It is understandable that, however much this open-mindedness suited his nature, it nevertheless became a consciously employed means of gaining support. The paternal tradition of fighting the barbarians completely filled this brave warrior, son of the hero of Marathon, and for him, the general Hellenic spirit far exceeded what any state, even his famous hometown, could aspire to be on its own. For Sparta, he possessed the inherited reverence of ancient Panhellenic sentiments, and he intended nothing less with his military exploits than to outdo Sparta by elevating Athens. The Plataean League still held its full strength for him. Fighting resumed in Thrace, on Cyprus, and on the coasts of Asia Minor. The blows inflicted on the great king's power were tremendous; on and along the western coasts of his empire, the Hellenes triumphed and ruled. And yet, the affairs of Panhellenism were already taking a very unfortunate turn. The Ionians began to complain about the Attic yoke, just as they had previously complained about the Spartan yoke of Pausanias. This constant effort was too much against their nature, and the Athenians demanded that they fulfill their obligations with great rigor. They thought that the unwilling could buy their way out of the war; the Athenians used that money to build ships and fight for those who stayed back. These, understandably, became all the more dependent on the leader of the alliance; they became completely weaned from war and soon possessed no ships or military equipment. Kimon also had to repeatedly bring back to submission allies who had defected; naturally, these allies lost even the semblance of independence.

Sparta watched with dismay how much Athens' power was thus consolidated. Could even that ancient fighter of tyrants actually tolerate one Hellenic state depriving another of its liberty? It secretly entered into an agreement with the rebellious Thasos; by invading Attica, it would provide indirect aid to that island. However, as if in a bitter mockery of fate, the Messenians, Sparta's slaves for centuries, took advantage of the turmoil caused by an earthquake to rise up against their oppressors, thus preventing the Spartans from intervening to save Thasos's freedom. Sparta found itself in such dire straits that it was forced to call upon its allies for help, and since the treaty of Plataea was still legally valid, it also turned to Athens. Despite the resistance of the ardent democrat Ephialtes, Kimon managed to persuade the Athenians to send a Spartan army to his aid. For the first time in about fifteen years, the Spartans once again saw an Athenian army on the field beside them. Now that they were once again in close contact with these people, they also suddenly felt more vividly the gulf that actually existed between them. Moreover, those qualities that had always hindered them in these allies.

That ease with which they seemed to overturn existing conditions, that overconfidence in acting on the dictates of the moment, that never flinching from the uncertainty of the outcome—none of this had undoubtedly improved during those years. These men came from numerous victories, in which their boldness had achieved what Spartan prudence had not dared to attempt: the liberation of the Asian Hellenic lands. More than ever, they were full of faith in themselves and their democracy. Like a bolt of lightning, the idea struck the Spartans that such revolutionary liberators might well develop sympathy for the Messenian slaves they were supposed to help bring back under the yoke. It was impossible to retain such people any longer. Under the pretext that they no longer needed their help, they sent them back home, alone among all their allies (461 BC). The anger and bitterness of the haughty Attic people after such a treatment is understandable. They considered the Platonic League completely broken and aligned themselves closely with Argos, Sparta's long-standing enemy in the Peloponnese. At that very time, Megara found itself deeply embroiled in a conflict with Corinth over the boundary. It broke away from Sparta's Peloponnesian League and sought support from the Athenians. They allied with them and occupied their land to protect it from the Corinthians. Meanwhile, the campaigns against Persia had also been expanded: Egypt resigned, and the Athenians of Cyprus came to its aid. It seemed that no effort was too great for this citizenry with its twenty thousand able-bodied men; She challenged the immense Persian dominance of the world, even beyond her Hellenic lands. She held a federal territory hemmed in by reluctant allies, encompassing almost all the coastal regions and islands of the Greek archipelago. She now stood ready to wage war in the Peloponnese as well, now that she considered herself insulted to death by the Peloponnesian leader of the federation. Yet, it was something other than a surge of vengeance that drove her here. At the very moment she was thus attacked in her innermost being, her soul overflowed with a consciousness of strength, and it became increasingly clear to her how much she was

on the path to greatness and dominance. In a sense, this challenge was welcome to her; she eagerly turned in all directions, wherever an opportunity for battle was offered her; the inner urge she felt to assert herself everywhere was powerful. It
78060 seemed to her as if, through every resistance she had to overcome, she felt her strength rising, and she also realized that she could only assume the great position she was consciously capable of by inspiring awe in all around her. She was now playing a high-stakes game and throwing herself into a terrible crisis, but in doing so she undeniably acted on the premonition that, from this scourge of effort and
78065 danger, her national greatness would truly shine forth in all its splendor. Such self-confidence cannot be justified before any tribunal of reasoning; moreover, when driven by such a natural urge to assert oneself and assert oneself, one is, by nature, completely incapable of lending an ear to a moderation that primarily seeks prudence, and a strict justice that never yields to circumstances. Such moderation
78070 and justice were represented in Athens by the venerable Council of the Areopagos. It was impossible for the Athenians to allow themselves to be hindered in their actions by these any longer. What lay in the direction of the developing democracy was also a practical requirement. With the most fervent indignation and deepest turmoil, many protested against the possibility of such an ancient, venerable institution being
78075 undermined. However, the necessity was too great. At the suggestion of Ephialtes, the Areopagos was stripped of all oversight over the decisions of the popular assembly. The Athens of Aristides and Kimon increasingly faded into the background; the time for a completely selfless dedication to the common Hellenic cause gradually passed; a completely different attitude now prevailed. Besides Ephialtes—a passionate but
78080 sincere party man, decisive, full of resilience, and of impeccable character—there were other popular leaders who opposed Kimon's policies, among them Pericles, the son of Xanthippos, who had entered the political arena after Aristides' death and had managed to acquire great influence. He was a man of highly noble descent, also on his mother's side, who belonged to the
78085 famous, though bloodstained, family of the Alkmai Onids; once more later, the Spartans, in his name, demanded the expulsion of all those who by birth were tainted with Kylo's bloodguilt; but then that ancient weapon proved completely blunted. His father, Xanthippos, was apparently one of those nobles who had joined the democracy—he was the leader of the Athenians at Mykale—the son could not imagine Athens as
78090 anything other than democratic. It was especially through his influence that democracy acquired a very peculiar perfection. It was truly beneath the dignity of a free Athenian to be welcomed by prominent people. Didn't the men who did so much for their country also have an indisputable right to the pleasures of life? Not only was the state supposed to ensure that sufficient grain was always available at a
78095 reasonable price, and that all citizens should be able to enjoy the meat of the state sacrifices during the great festivals, but also, through direct payments from the state treasury, the Athenians had to be enabled to celebrate their worthy feasts. It was in this direction that Pericles, in particular, exerted his influence; thus, it was decided that the poorer Athenians would receive money from the state treasury to
78100 pay the admission fee for the theatrical performances of the Dionysus festivals. This approach continued. The free Athenian owed no one for what he received in this way; he gave it, so to speak, to himself. Such measures were a matter of principle, but they were also a powerful weapon against Cimon, whose natural generosity, as we have seen, also became a political tool.
78105 Pericles was first and foremost, one might almost say exclusively, an Athenian; The fatherland could then still—and this would soon change—satisfy all the higher needs of a richly gifted mind. Yet Pericles' Athens was far from one that, like that of the tyrants—he was indeed compared to Pisistratus, and even the elderly were astonished by the similarity in appearance and voice—lacked all higher Hellenic consecration.
78110 Yet, of course, he was also far removed from Panhellenic sentiments like those of Cimon. An Athens that was even remotely absorbed into Hellas was, in his view, a theory completely at odds with the actual state of affairs. Rather, one could say, conversely, that Hellas was nothing but Athens. After all, it had initially been primarily thanks to Athens that the barbarians had been driven back; Afterwards,
78115 after Sparta had withdrawn, the national struggle was only sustained because Athens held the allies together, indeed, increasingly shouldered the burden of war on its own shoulders, merely forcing the unwilling to contribute money. Thus, the struggle with the barbarians themselves led the Athenians to dominance. It was simply a matter of accepting it, and it was the most natural thing in the world that they did so.
78120 However,—this must never be forgotten—they could only possess it despite Sparta and the Peloponnesians, and above all, a powerful Aegina, directly opposite the port of sea-ruling Athens, was utterly intolerable.

Pericles was a man of reason, and thus what stirred the Attic citizenry at that time stirred him to reflection and reason, and therefore, amid the complications that now followed, he was the most suitable leader of his people. Yet, this also implied something else. The rule of reason also means self-control. Pericles was destined to become, so to speak, the Areopagos of his people, but naturally, one who felt and thought accordingly. He understood sooner and better than anyone that the tremendous Attic power was in danger of being destroyed in futile outbursts. Often, in moments of slackness—and these too were to become more frequent the more their strength was wasted—Pericles also called his people to renewed effort. But this Athenian was a true Hellene in this respect as well, in that he considered the enjoyment of life one of life's primary requirements, and he was not one for a restless drive that seemed to forget that the primary goal should not be the acquisition, but the enjoyment of power. Especially through Pericles, the idea increasingly gained traction that just as the Athenian citizen was at the expense of the state treasury—Pericles arrived at the same point here as with his democratic theories—so too was the champion of Greece entitled to a life worthy of him, full of pleasure, a life full of splendor and glory—at the expense of Greece's treasury.

It was not long before Cimon was banished by ostracism. The sheer number of struggles into which they plunged is astonishing. In Europe, in the region of Megara and in Argolis (the land of Argos), they fought with Cimon Rinthians, Epidaurians, and Aeginetes; Aegina was besieged. Occasionally, they were less fortunate; on the whole, however, the powerful onslaught of the Attic forces was utterly irresistible. We still possess a fragment of a tombstone,¹ according to the inscription, erected for people of the Erechthean tribe, who "had fallen in the same year (458 BC) in Cyprus, in Egypt, in Phoenicia, in Halieis (a place in Argolis), near Aegina, near Megara."

Numerous names follow.

In fact, it was the policy of Themistocles that was more fully developed and perfected during this period. Thus, his buildings now also attain a completion that would better meet the designer's intentions. A fortified Athens and a fortified Peiraeus were not satisfactory as long as they each stood alone. Therefore, two parallel walls were built, two hours' walk in length, to connect the adjacent ports of Peiraeus and Phaleros with the city. Work continued restlessly on this amidst all these campaigns. Between these two walls, the city would always be able to maintain communication with the port in the event of a siege, and the space available to accommodate the fleeing population of Attica in that event became astonishing. At that very time, a significant Spartan and Peloponnesian army appeared in central Greece to protect the Dorian mainland there from the neighboring Phocians. When they attempted to return, the Athenian fleet cut off their return route by sea, and the Attic garrison of Megara cut off their return route by land. The long walls were not yet completed, and yet the Attic citizenry confined a powerful hostile army on its exposed northern border, amidst the Boeotians, many of whom deeply hated Athens and yearned for the humiliation of this so dangerous neighbor. In the city itself, the old noble party, which had been completely powerless since the days of Clisthenes, was stirring. This nearby Spartan army emboldened them; they secretly communicated with them. It was no time to delay. The Attic citizenry advanced toward Boeotia. A terrible battle was fought at Tanagra (457).

The situation, it seemed, became even more perilous. The Athenians suffered defeat. Fortunately, however, the Spartans were satisfied if the victory provided them with a free return home. After they had departed, another Attic army marched into Boeotia. That country was conquered; the Phocians also joined Athens; The Locrians submit; Athens rules central Greece.

Meanwhile, after a siege of about two years, proud Aegina bowed its head (456). It was forced to demolish its walls, surrender its ships, and henceforth pay tribute to the Athenians. A period of centuries had ended. All the glory of the glorious Aiaides island was lost forever. From its earliest days, the Attic state had always had to develop despite its western neighbor; now, having reached its highest point of strength, it shattered the obstacle that had taunted it for so long.

During this time, the long walls had also been completed. An Attic fleet immediately spread fear and dismay along the coasts of the Peloponnese. Later, a major expedition was undertaken under the command of Pericles. They landed in Sicyon (in the northern Peloponnese) and defeated the Sicyonians, then allied with Achaia, crossed the Gulf of Corinth, and subdued Akarna. A great goal had been achieved. Athens now stood truly unassailable, with complete freedom of movement to attack anyone else. However, the fact that almost the entire army fighting in Egypt had perished miserably cast a deep shadow over all this success. An expedition to Thessaly was also not successful.

At the same time, Athens' dominance over its naval allies had been confirmed. The confederation was transferred from Delos to Athens. The Hellenotamia would no longer be under the auspices of the Ionian Apollo, but under that of the Athenian Athena. The City Goddess received one-sixtieth of all the tributes that came in. We still possess important remains of the official lists that were drawn up annually of these payments to the Goddess. They begin with the inception of the administration of the confederacy in Athens and cover a period of more than thirty years;1 after all, the Athenians had the custom of having such records chiseled in stone. Allies who believed they were being charged more than they were required to pay could lodge a complaint with the popular court of Attic jurors. Wasn't it fair that these jurors should receive a certain remuneration from the confederacy?

This was soon considered entirely Athenian property.

Not everything that had happened, however, had been in accordance with Pericles's view. He had real reason to be wary of a useless waste of popular energy. Kimon was recalled to his office, and through his mediation, a five-year truce was negotiated with Sparta (454). Kimon resumed the war against the barbarians in Cyprus and Egypt, but died soon after.

It was not long, however, before the Attic citizenry found itself embroiled in new complications. The alliance with the Phoenicians once again placed them on hostile terms with Sparta. Completely against Pericles's advice, a new campaign was undertaken in Boeotia to drive the enemies there from their last refuge. Now, however, Athens appeared to have reached the limits of its power. The army in Boeotia was miserably defeated at Koronea (447). That entire region became independent. Dangers now arose on all sides. Euboea resigned. Pericles crossed over to that island with an army. However, news arrived that Megara had also resigned, that a Peloponnesian army was advancing into Attica, and that almost the entire Attic garrison of Megara had been cut down. Quick as lightning, Pericles turned back. The Peloponnesian army retreated; Pericles had managed to bribe the Spartan commander. The general immediately returned to Euboea. It was again subdued.

How irresistible became the man who had warned of the danger and rescued it! Now the time approached when, according to Thucydides, the Attic state, nominally a democracy, would in fact become the rule of a single ruler. Pericles was a king. His contemporaries recounted that before his birth, his mother had experienced a vision according to which she would give birth to a lion. However, he regained his lofty spirit as an Athenian, during the time of such national exaltation, and the Attic people felt that only then would they be as truly ruling people when Pericles elevated them to his height. With the calm self-confidence of a born ruler, one had to enjoy his greatness: only those who barely considered themselves entitled to possess it were allowed to flaunt and boast of their glory. In the uplifting consciousness of being an Athenian, one had to scorn troubles and dangers and keep one's eyes constantly fixed on the greater good, never allowing one's soul to be depressed by passing adversity. Conversely, those outbursts of arrogance, which, taken outside oneself, overestimated and squandered one's strength, were not only, as had become apparent, highly dangerous, but also hardly in keeping with the self-control and even temper of the true ruler. Only through such a spirit could the Attic people maintain their exalted position, and it seemed that this could only be possessed by Pericles.

It was also as if all of modern Athens was perfected in that man. How much did that city owe to that spirit of enlightenment, which, emerging simultaneously with Hellenic philosophy, had been making its influence felt for almost two centuries. Without these, there would have been no Attic democracy, no Solon, no Clisthenes—without these, there would have been no Themistoclesian policy, no Attic fleet, which had to be established against the old traditions, no abandonment of the old sanctuaries before the Battle of Salamis—without these, there would have been no limitation of the Areopagos' power—without these, there would have been no tragedy or art by Phidias. In Pericles, we see him acting very forcefully and at the same time coming into the closest contact with that stricter philosopher, who, if not his mother, was certainly his nurse. At that time, there lived in Athens a philosopher from Clazomenai, Anaxagoras. The people mockingly called him "Nous" (Reason), because they had heard something about this man, who considered the world to be inspired by a great, thinking mind. Pericles was on very cordial terms with him; He also came into contact with other thinkers of his time, for example, the philosopher Zeno. He warmed himself by their fire without being burned; had he become their follower in the strictest sense, he would no longer have remained confined within a Hellenic or Attic

78255 horizon. However, the very principle of the natural philosophy of that time, that the
phenomena of nature could be explained, gave him a sense of sovereignty of reason,
which was most welcome to him and entirely in keeping with the intellectual direction
of his mind; all those signs, solar eclipses, strangely morphed animals, and the
78260 like, which terrified the crowd with what they seemed to foreshadow, left the
convinced one in quiet possession of himself.
That one saw nothing there but natural consequences of natural causes. In another
respect, too, this philosophy gave man a sense of spiritual prowess. It achieved
results through reasoning, often forcing others to concede defeat even reluctantly.
78265 With a certain naiveté, then and long afterward, logic, which one first became aware
of using, was regarded more or less as a special art, one that one had, as it were,
been fortunate enough to discover all at once. Pericles now wanted to apply this art
practically to the life of the state—for a popular leader, it was of great value—and
he thus became the father of Attic oratory.
That lofty disposition, that lively awareness of spiritual strength, were naturally
78270 paired in this king of democracy with great open-mindedness of character. He was far
above any petty jealousy. The spirit of exclusion of a party man like Ephialtes was
completely foreign to him; his opponent Kimon experienced this on several occasions.
His Highness was also one who embraced goodness and human kindness, being the
complete antithesis of that narrow-minded desire to assert himself through torment.
78275 His sense of order and prudent deliberation, a natural outgrowth of his intellectual
orientation, did, however, sometimes make him appear narrow-minded and petty in his
private affairs. His household was relatively frugal and strictly regular; he shunned
all excessive luxury and pointless waste; Attic self-restraint in pleasure¹⁾ ran deep
in his blood. His children, however, all too unlike the father, complained that they
78280 were not permitted to live in accordance with their high birth. The Attic nobility,
entirely in the style of Kimon, still often saw an extremely luxurious lifestyle and
the carefree enjoyment of their wealth as more or less a characteristic of his
station; in this respect, he was actually still Ionian. Pericles, however, had
completely outgrown such feelings; even in his private life, he was a counterpart to
78285 Kimon. Yet, despite all this, there could be no question of a narrow-minded
attachment to money and possessions in him. Many examples of great benevolence could
be cited from him, even though they had nothing to do with his politics. He stood far
above all base greed than most of his contemporaries and compatriots, the man who
exerted a greater influence on his fellow citizens through nothing than the fact that
78290 everyone knew he was not to be bought for the earth's treasures. How could anyone
blame him for not wanting, at any price, to become dependent on his outward
circumstances through a neglected household?
Pericles would not have been an Athenian, would not have been a Greek, if he had not
attached great value to appearances. In all his behavior, in his entire demeanor and
78295 manner of presenting himself, his disposition and spiritual state were therefore
faithfully reflected. He was far from ever displaying a nervous activity; he never
allowed his speech or actions to be dominated by momentary moods. He moved sparingly
in social life and did not step into the spotlight more than necessary—he considered
this advisable even as a statesman—but when he appeared among his people, it was with
78300 majestic calm and dignity. His gait was stately, his bearing dignified, and he
possessed complete control over his facial features. On his head he wore a helmet,
which was especially fitting, as he was usually chosen as a strategist (army
commander); however, his head was somewhat deformed, as it tapered somewhat, and he
seems to have wanted to prevent the ludicrous appearance of this deformity from
78305 detracting from the impression his person made.¹⁾ Nor was the arrangement of his
clothing left to chance; His left arm, according to the more stately attire, was
wrapped in the upper robe, while the right was entirely sufficient for the moderate
movements he had to make. His mouth opened, his powerful, solemn voice rolled across
the entire square of the popular assembly. This man passionately loved Athens; this
78310 man could be trusted implicitly; no one knew better than he what could promote the
greatness of the fatherland; his argumentation had something quite extraordinary; in
a surprising way, one had to concede defeat again and again. It was a sublime
spectacle: an entire nation, powerfully self-aware, dominated solely by the moral
superiority of a single person, in whom it saw its most exalted and magnificent
78315 qualities and feelings represented in the most perfect way.
Was it any wonder that this man's actions brought the name "Olympian" to the lips of
his fellow countrymen? How did Hellenic religious concepts, even in their highest
form, cling to a humanized deity. Even those withdrawn, heavenly-calm gods of the
more enlightened way of thinking found their counterparts here on earth, and none
78320 were more so than precisely the man in whom, more than in anyone else, that

enlightened spiritual current reached its zenith.

Pericles, as has been noted, lived somewhat secluded; this was also made necessary by his many concerns and activities. Yet he valued the Attic life, which he could enjoy only sparingly, with true patriotic fervor. Undoubtedly, the sociable existence of people in Athens had developed to a very high perfection. People enjoyed together, they admired together, they sacrificed communally at the altars of the gods. However, a very important element was missing here. Respect for an ancient social order, whose dissolution was feared more than anything else to lead to the degeneration of morals, was the reason why, while life developed ever more richly, the Attic woman continued to exist in her secluded state. This was one of the refuges into which the new spirit of enlightenment had not yet penetrated. Yet, even the enlightened, especially, felt deeply what a woman could be in life; Sophocles's magnificent female figures are proof of this. It was also a gap so great that it had to be filled. Foreign, especially Ionian, women lingered in large numbers in the city and lived as hetairs (companions) in free association with Attic men. It was undoubtedly also the need for social interaction with women that made association with these hetairs so appealing. That such free associations carried with them a very great danger goes without saying. However, in assessing this, one should never lose sight of the fact that there was also a relatively easily resolved marriage involved.

Pericles, too, did not live happily with his wife. Socrates says in Xenophon—and he usually reflects the master's sentiments fairly faithfully—to a certain Critobulus that a good wife can contribute no less to the happiness and prosperity of the house than the husband. But what does the Attic wife of the household understand, Socrates continues,? She cannot learn it either, for no one shows her the way to good, least of all her husband. She is married off at a very young age, and to whom does the man speak less than to his wife? But what preparation for marriage would be desirable for Attic girls? The philosopher cannot explain this to Critobulus in detail, but he would like to send Aspasia to him; she is more knowledgeable about all this. Elsewhere, too, Socrates, with a certain fondness, cites a statement by Aspasia regarding marital matters: how wrong it is to bring together young people who are not compatible, since the one who brought them together only reaps hatred from both parties.²)

There is no doubt that the noble philosopher held this woman in high esteem. We even learn that, accompanied by his students, he frequently conversed with her. She was not an Attic, but a native of the Ionian city of Miletus, the daughter of Axiochus; we know nothing whatever of her fortunes before she arrived in Athens. Pericles became very close to this woman. By mutual consent, he separated from his wife. She married again—for the third time, as she had previously been married to Hipponikus—while Aspasia came to live with Pericles and remained his companion until his death. A marriage with her, the non-Attic by birth, was an impossibility; we know nothing about whether they ever regretted it. It was, however, highly gratifying to Pericles that, when both his legitimate sons died, the Attic people granted citizenship to his illegitimate son, whose mother is almost certain to have been Aspasia, thus removing the consequences of his illegitimacy for him. We cannot help but assume that this man and this woman were also bound by a bond of higher sympathy. Without a doubt, Athena's greatness and majesty captivated the Hellenic soul of that Milesian woman, and Pericles found in her a complete understanding of his aspirations, his concerns, his efforts. Rumor had it that she taught Pericles and many others the art of oratory; Pericles also supposedly sought her out for the sake of his political wisdom. However foolish this may have been, it seemed to be realized that she was something different for him than Attic women could usually be for their husbands. Thus, Attic life received a most necessary completion in Pericles. Plato also remembered having heard his master speak of Aspasia. In his *Menexenos*, he has Socrates to mock heartily that talk about her instruction in rhetoric. Attic comedy, in particular, vilified her in a gruesome way; slander, in that time, so naive in so many respects, was perhaps the most naive of all. Aspasia stood at the head of a line along which one was led, through numerous gradual transitions, to the deepest depths of baseness; was it any wonder that the general public drew no boundaries where law and convention did not? After all, she was and remained a hetary. More or less, she shared the fate of her philosophical friend. If only we knew Socrates only from Aristophanes' "Clouds," in which he is mocked as a sophist, although he, in fact, took very decisive action against those corrupters of youth! But wasn't that man, with his artificial reasoning, also in a certain sense a sophist, and therefore that confusion a very understandable superficiality? Aspasia also truly exerted some influence on Attic life. Not only women, who would later live in free intercourse with men, but also Attic female citizens were brought into her environment. Her

insight into what women needed for their development, which Socrates appealed to, had thus been demonstrated in practice. The way in which she taught was undoubtedly that truly Hellenic way of communicating,¹) which Socrates, in turn, also put into

practice. And truly, the time now seemed to have arrived when the enjoyment of life in all its glory would be the main thing. The struggle with the Persians was not resumed after Kimon's death. Yet, one could say that almost everything that spoke Hellenic in Asia was safe from the attacks of the barbarians under Athens' scepter. Pericles concluded a thirty-year peace with the Peloponnesians (445); Boeotia and Phocis, and the conquests in the Peloponnese, were abandoned.

Attic citizenship thus gave great proof of moderation and self-control. No one, however, understood better than Pericles that one day they would have to fight again to preserve what they had gained. He persuaded his fellow citizens to build another long wall between the other two. This measure would connect both the difficult-to-defend Phaleros and the very strong Peiraeus to the city; through the new wall, the latter would also be connected to Athens. Thus, Athens would be almost as unassailable as an island,²) and the Attic citizenry, if it could only refrain from futile undertakings beyond its powers and preserve the true spirit of power exemplified by Pericles, could await with the utmost tranquility any enemy that might appear.

Now, however, there was at least a moment of relief. Such tranquility had not been known since the time of the tyrants. More than thirty years had passed since the barbarians had been fought in Greece itself, and yet they had not yet had time to regroup, so to speak. Numerous sanctuaries, destroyed by the barbarians, still lay in ruins throughout Greece; as long as these were not restored, matters did not seem to be back on solid ground. At Pericles' suggestion, the Athenians decided to send envoys throughout Greece to invite all the Hellenic states to a meeting in Athens, in order to take measures to rebuild all the sanctuaries destroyed by the Persians.

But how could the Peloponnesians, in particular, align themselves, as it were, under the hegemony of Athens in the religious restoration of all Hellenism? Pericles felt compelled to limit his plan to his own homeland. A chosen field of work was opened up for a whole generation of artists: the fatherland, in such a time of national greatness, had to be provided at once with almost all the monumental buildings it needed. The money was available; Athens owed that to its dominion; it freely disposed of the federal treasury.

No buildings, however, were of greater importance than those on the castle of Athens. There lay the center of Athens' existence and greatness. There the plan was made to build the Propylaea, a forecourt leading to the castle; there the House of Erechtheus and the Temple of Athena-Nike had to be renovated; there also—and everything was significant—had to be rebuilt that temple that once stood on the highest point of the castle, the Parthenon of the Pisistratidae.

How could Athens have achieved such a level of greatness and glory without also enhancing the splendor of the Panathenaia? Pericles had a large building erected at the foot of the castle, called the Odeion, in which musical competitions were held, which on his advice were added to the games of the Panathenaea.

The reasons why the house of Erechtheus had previously no longer met the need^[1] were now even more pronounced; a temple was needed that was more in keeping with the more enlightened religious outlook and the heightened splendor of the city festival, a temple where one belonged with the exalting feeling of victory in one's bosom. To all this, new reasons now arose. Athens's Castle Goddess had become, simultaneously with her people, the supreme ruler of a vast Hellenic territory; the sums of money that flowed to her from that region had to find a worthy refuge; no less so the astonishing mass of votive offerings in which such a deity might rejoice. Construction of this temple had to begin.

It was the edifice in which the Attic people, as it were, expressed themselves in all their splendor and power. As if by a primordial impulse of nature, the ancient peoples felt the need for monumental art. An Asian conqueror, returning from his campaigns, imagined his greatness tangible before his eyes in colossuses, temples, and palaces. Here, a people now feels that, after a long, anxious struggle, it has reached the highest point it can, and it now wishes, as it were, to proclaim in a lasting memorial to all succeeding generations: "This is me."

Only after a fierce struggle were Pericles' building plans adopted. Were their opponents wrong when they claimed that Athens would damage its reputation by thus using the funds of its allies to enhance its own splendor and glory? The Attic citizenry, however, demanded these buildings—the necessary completion of its

greatness—almost as a condition of its existence, so that here, too, grounds of justice and honesty could make little impression.

78455 Pericles was the most influential of those entrusted with the construction of that new Parthenon. To whom else could the supreme direction of that work be entrusted but the exalted artist, who, utterly imbued with the lofty ideas of his time, seemed capable alone of giving them worthy expression—to Pericles' friend, Phidias Charmides' son?

78460 While the artist labored, the statesman could not rest. With a firm hand, he had to hold together what alone made the realization of all that splendor possible. A large Attic fleet constantly appeared in the seas between Europe and Asia to show the barbarians that Hellas' guards were still watching—was it not fair that these were paid well from the confederation's treasury?—and at the same time to keep the allies

78465 in awe. These, however, were reluctant to submit to Athens' rule; precisely at the time the Parthenon was being built, Pericles was waging a fierce war against the rebellious Samos. And even more deeply, the foundations of the Athens of that time were threatened by entirely different dangers. While enthusiasm for freedom was originally the soul of democracy, the generations that now grew up increasingly distanced themselves from that first, animated period of struggle for freedom and

78470 existence, and in their actions, found democracy to be a legally existing condition. Democracy was self-government, democracy was equality. It was inevitable that now, governing and judging would truly acquire the greatest appeal in themselves, and people would become increasingly less inclined to acknowledge the majority of others,

78475 even the moral and intellectual ones. - Why should one look up to one's fellow citizens? The community had to judge every proposal made to it as the supreme sovereign. - In a word, democracy, like all earthly matters, was in great danger of losing its original naiveté, and thus the foundation of a rule like that of Pericles was threatened. And while the more old-fashioned religious movement was not

78480 originally hostile to the newer one, indeed, it was not even sharply distinguished from it, [1] now that it has reached its highest peak of development, this cannot remain so. A religious reaction had to develop. The freer life of several Athenian women under the influence of Aspasia was particularly offensive. The reactionary deeply felt the connection between old religious ways of thinking and old social

78485 institutions. Pericles probably did not sense the full extent of this evil: it only revealed itself in his first signs. - The cothurn, the high stage shoe of tragedy, has, as if by a law of nature, the lower footwear of comedy alongside it. When in Attica one had seen the demigods of mythology in ideal majesty in the tragic plays, it satisfied a

78490 certain need to see them in the satirical drama in crude reality, for once of a lower life. For example, the most exalted hero Heracles appeared there as a glutton and drunkard; the genre of Jan Steen lies as deeply rooted in human nature as that of Raphael. Likewise, Attica also had its carnival fun of old, namely at the rural Dionysus festivals, where people, with a certain brutal intent, surrendered

78495 themselves for a while entirely to the lower pleasures of human nature and indulged in crude wit at the expense of everyone within reach: it even had its own genre of folk poetry there in the satirical and satirical songs of comedy. Today, however, when one is faced not only with the world of demigods in tragedy, but with an entire generation of contemporaries in the chorus, even that comic sense of the lowly

78500 naturally acquires the significance of a spiritual direction of the time. - What did all this exaltation mean? Did Athens possess so much more true greatness than in earlier times? Was it more pious, was it more just? Comedy, too, naturally became a higher literary genre with political significance. The first comedy poet in this sense was Cratinus, who was precisely in his prime during Pericles' time. He was very

78505 much one of those natures that adhere with all the more zeal to ordinary reality the more they see others inspired by a lofty aspiration. Cratinus, too, did not escape the danger inherent in this trend; even less than our Jan Steen or Breerloo, he was a model of restraint. With crude, impudent mockery, yet witty precisely because of its roughness and impudence, he mocked, referring to the man's nickname, Pericles,

78510 "onion-headed Zeus"—a quasi-Homeric epithet, referring to his pointed head—and Hera-Aspasia. A man of fundamentally conservative convictions, for example, was in all likelihood another comedian from Pericles' time, Hermippus, and undoubtedly the slightly younger Aristophanes. But already because of what all these comedic poets had in common—namely, that utter disbelief in the higher spiritual direction of their

78515 time, that heartfelt delight with which they tried to show how ordinary, if not commonplace, that so-called highness actually was—they exerted a great deal of influence and certainly contributed significantly to completely undermining the people's respect for intellectual superiority. For several years, the freedom of

these comedic poets was restricted by a law. It was precisely during the construction of the Parthenon that this law was enacted.

The Olympian was still able to completely control the situation. They continued to work on the great project, restlessly, just as the Attic citizenry could work in the glow of the highest national inspiration, and undoubtedly not entirely without the determination to complete it before perhaps entirely different times dawned. The harbors were a hive of activity: precious stones and woods, copper, ivory, gold—in short, the world's treasures—were brought in from all directions. Drivers constantly traveled back and forth between these harbors and the castle; large cargoes were also transported from the Attic region itself, especially from the Pentelic marble quarries. In and around the castle itself, stonemasons, carpenters, coppersmiths, chisellers, ivory workers, metal smelters, sculptors, painters, and the like worked. Even those not directly involved in the work, such as wheelwrights and ropemakers, felt its influence. Like the warriors on the fleet, the workers in the city now also enjoy the benefits of their acquired dominion. The renowned architect Iktinus and the excellent master craftsman Kallikrates worked under Phidias; more specifically, the sculptors had to work from Phidias's drawings and models. The influx of interested people was immense, constantly showing themselves at the castle. With amazement—was Aspasia's influence perhaps discernible here?—one also noticed women among them. A very cheerful atmosphere prevailed throughout. Attention was drawn to a discarded mule, eighty years old, which, although no longer employed, nevertheless accompanied the other draft animals, seemingly to encourage them to greater diligence. Such dedication to public affairs had to be rewarded. The people made a decision—was it half serious, half fleeting?—that this animal would not be chased from its cribs, and would therefore be fed at the state's expense.

After a few years' effort, the new temple was consecrated during the great Panathenaic Mass of 438.

(Conclusion to follow.)

The Attic people and the art of Phidias. IV. (Conclusion.) The Parthenon.

It was the most glorious temple of the Antiquity, which shone there on the highest point of the castle, offered a votive offering to the heavenly virgin.¹⁾ It was built in the Doric style. From a pedestal, rising in three stages to a height of over 1.5 meters, rose powerful Doric columns—8 on the shorter, 17 on the longer sides of the temple—which supported an impressive superstructure, with a roof that sloped towards both longer sides of the building, while an obtuse-angled facade joined it at the shorter front and rear. The columns were clearly designed for their enormous task: twenty upward-reaching cannonballs demonstrated their strength, and as they narrowed and rose, they did so in a somewhat curved line, so that, especially in the middle, where the pressure between the pedestal and superstructure was strongest, they were somewhat broader (αντάρσις) and thus visually more powerful than they would have been if the narrowing had occurred in a perfectly straight line. Moreover, besides supporting the superstructure, they seemed to have to contribute, at least to some extent, to holding it together; this impression was given by their slightly inward-leaning position, not entirely perpendicular to the base. Freer than the upward-reaching stem of the column. The leaves, which visually formed the capital, spread outward, but with their converging points gathered under the flat surface of the abakos, they were projected outward as a sphere, a result of the relentless force from below and the heavy load from above. The beginning of the superstructure was formed by the smooth beams of the epistyle, which ran across all the column capitals; above these, in continuous alternation, stood the row of triglyphs and metopes, the latter decorated with reliefs. The cornice further above this supported the roof on the longer sides, and the upright moldings of the triangular pediments on the shorter sides, in which groups of Avar sculptures were placed. A large foliate ornament stood on the tops of these triangular pediments, and at each end a golden oil jar, reminiscent of the jars that victors in Athena's contests were accustomed to receive. The temple reached a height of approximately 17 meters, with a width of over 30 meters and a length of almost 70 meters, making it wider in proportion to its length than the other Doric temples, which were undoubtedly somewhat elongated. The entire building shone in soft colors; perhaps not painted in all its parts, the Pentelic marble from which it was constructed also radiated a soft, light-yellow glow. The

78585 superstructure was primarily painted in red and blue, but the marble's luster shone through all the paintings. The leaves of the capitals were indicated by colors; similarly, kumatia with colored leaf ornaments ran along the inside of the façade frame. Two magnificent maeanders encircled the entire superstructure, one below and the other above the row of triglyphs and metopes; just below the topmost maeander, a
78590 delicate string of pearls also ran, also completely circular. The outer edges of the facades were bordered by a beautiful floral and palmette ornament. All these ornaments made it easier to grasp the building's main forms at a glance—something that fully met the truly Attic need for clarity.

And the beautiful appearance was achieved solely through the thorough and meticulous
78595 workmanship of all the building components, including the smallest ones; everything fit and meshed perfectly; no sloppiness needed to be covered up. During the subsequent destruction of the temple, it often happened that marble blocks, assembled without any external connection, broke through without touching at the joints; through such strong cohesion, they had become connected under the great pressure to
78600 which they were subjected, as a result of the precision with which they fitted together. However, several components—metopes, triglyphs, columns—were apparently deliberately not made perfectly identical; moreover, even the spacing between the columns was not always the same. The differences, however, are such that the most trained eye would not notice them, and yet the structure thus acquired a somewhat
78605 looser and freer quality, so to speak, more of a natural product. It has also been noted that all the horizontal lines, both on the superstructure and on the pedestal, had a slight curvature, making them somewhat higher in the middle. Others, however, believe this is primarily due to the consequences of subsidence. In all respects, it can be said that Doric temple architecture found its perfection and refinement here
78610 in Attica, just as the Attic style in general was a perfection and refinement of the Hellenic style.

This superstructure now, with its columns was placed "like a canopy"¹⁾ over the temple proper, so that one could walk—as always with Doric peripteral temples—between the inner temple and the columns. At the top, this gallery between the temple walls
78615 and the surrounding columns was closed off by a magnificent panel-painted ceiling. Below this ceiling, separated only by a kumatization and a beautiful ornamental band, a bas-relief frieze ran around the entire inner temple for a length of approximately 160 meters. From this encircling gallery, one entered the front of the building—that is, on the eastern, narrower side—in the so-called Proneos (ante-temple), also
78620 intended for votive offerings. From there, through a large door, one entered the actual temple space, the so-called Hekatompedos (hundred-footed temple). This was divided into three aisles by two rows of columns. At the end of the wide nave, directly opposite the entrance, one could see the statue of the Goddess in a large niche; in front of this niche, a section of the nave was separated by a not very high
78625 metal latticework, bearing the name Parthenon—"virgin chamber"—a name that was also applied to the entire building. In this Parthenon, in the narrower sense, most likely stood a platform where the victors in the contests could stand opposite the statue of the Goddess, not unlikely for a more solemn awarding of victory; the side aisles and upper galleries could then be occupied by spectators. This partitioned Parthenon was
78630 also intended for votive offerings; so were the others. Hekatompedos. Light entered this inner temple space from above through an opening in the roof (Οναϊον). On the west side of the building, one entered through a small forecourt similar to the Proneos, the Tamieion—a room for the treasurers of the sacred funds—into the spacious rear building (Opisthodomos), the repository of these sacred funds.

78635 Walking outside, around the temple, one saw the metope reliefs pass by one after the other. These, as we saw, were placed in the superstructure, alternating with triglyphs, beneath the cornice. There were 92 of them, 14 on each of the shorter sides, 32 on each of the longer sides. The relief work rose to a height of about a quarter of a meter and stood out brightly against the colored background, while—we can safely assume—itsself being highlighted by color in various sections. Many of these metopes still remain in the ruins of the Parthenon; with a few exceptions, they have become almost entirely unrecognizable. A few others, the best preserved, can be found in museums, primarily in the British one. The reliefs of the middle section of
78640 the temple, which exploded during the gunpowder explosion of 1687, have, of course, been lost; we still have Carrey's drawings of those on the south side.[1] What all these rows of metopes depicted cannot, therefore, be stated with complete certainty. There is little doubt that the front of the building, the eastern side, depicted the battle of Gods and Giants. The rear, the western side, probably depicted the battle
78650 between the Greeks and Amazons. The relatively well-preserved metopes belonged to the

south side; they depict the battle at the wedding of Peirithous, when the Centaurs attempted to abduct the Lapith women. These depictions were interrupted in the middle by several others, not unlikely from the legends surrounding Troy's downfall, just as it is not improbable that the north side primarily depicted scenes from the legends of Troy's downfall, interrupted in the middle by several Centaur battles. These were all combats in which higher morals were believed to triumph over brutality and barbarity, or rather, the mythical precursors of the goddess' own heroic struggle against the barbarians. The national inspiration here is therefore unmistakable. In the Battle of the Giants, depicted on the front of the temple, the goddess herself had played a major role; this was also embroidered on the state robe (peplos) she received annually. The metopes that have been preserved are in sufficient condition to allow us to assess the sculpture. High demands were placed on the artist's imagination here. Each metope could only contain a single, smaller depiction, and what else could that be than a duel between a Centaur and a Lapith—or would one prefer a Hellene—or a Centaur stealing a woman? The same thing therefore had to be depicted differently each time. For example, at one point the Centaur presses the Lapith down, putting an arm around his neck (see Michael), then again the Lapith has jumped behind the Centaur and pushes him back with his left knee and, simultaneously, his left arm, lashing him with great force around his neck (2nd metope). Elsewhere, a Centaur has forced the Lapith against a barrel, several of whom were naturally present at the wedding, and is rolling him backward over it, lifting him by one leg (9th metope). With a violent lunge, a movement in which his entire body participates, as it were, and which also transfers itself to his garment, on another metope (7th metope), a Lapith has seized the Centaur by the throat and forced him so far backward that he can barely stand on his hind legs. Similarly, another Centaur, outnumbered (27 metopes), is to the left, holding his hand over a wound in his back and trying to escape; The Lapith holds him back, his left hand around his neck, and with it he pulls him to the right, pushing himself off the ground with his left foot. The Lapith will not be able to hold his enemy back for long; however, he has already raised his free right arm (this one is lost) for a deadly thrust. Lapith and Centaur, each striving for an opposite side, balance each other for a moment. At the same time, the Lapith's broad cloak falls from his shoulder, straight to the ground, just as swayed back and forth as the two combatants. More fortunate is a Centaur on a metope right next to this last one (the 28th). Joyfully, with a wagging tail, he leaps over the body of his enemy, a handsome youth, who lies back on the ground in a strikingly true pose.

Other metopes are different. The last three described are among the most outstanding examples of Attic sculpture. The chosen moments are highly interesting; everything is full of expression, the postures and bodily forms are very beautiful; the clothing is exquisitely crafted. Most of the others are open to criticism; yet many of these also offer much beauty (e.g., the 1st, 5th, 7th, and 9th). There are also some, however, that are even quite low: the combatants, for example, are touching each other, but there is no hint of a struggle (e.g., the 6th and 32nd); the bodies are gaunt (in the 32nd) and not entirely correctly formed; the composition leaves unsightly gaps in the background (e.g., the 26th); the postures are contorted to the point of impossibility (e.g., that of the Lapith's arm in the 31st). Many metopes, even otherwise beautiful ones, also show the clearest traces of the older artistic style: the bodily forms are sharply defined; it has not yet been possible to accurately depict the bodies in their various curves. The movement is not expressive (e.g., in the 30th metope) and so on. The difference in the heads is also great; from the most nobly formed face (the Centaur in the 4th metope) there is all sorts of diversity to the grotesquely monstrous (the Centaur in the 31st metope). It is also beyond doubt that one of the Centaur heads (the 19th metope) bears a strong resemblance in type to the head of Myron's satyr. Thus, a very significant difference in the hands can be observed in these metopes, and this gives us a clear insight into the nature of Phidias's work. He worked with artists from all sorts of schools, including those of Myron, who were still completely accustomed to other artistic methods. They all had to be brought up to speed on his art, but that suddenly proved impossible. The metopes were the first sculptural work to be delivered—they had to be inserted between the triglyphs before the cornice was placed on top—and even then, the corps of artists was far from fully inspired by the master's spirit. Here, we see, as if before our very eyes, how all of Attic art is being transformed.

This was already practically accomplished when the façade groups, consisting of freestanding statues, were put in place, although not all of these pieces were executed with equal mastery. The group on the eastern façade, that is, at the front

of the temple, depicted the birth of Athena; that on the western façade depicted the struggle between Athena and Poseidon for possession of the Attic lands. Even today, in the old house of Erechtheus, one still finds both the saltwater spring, which
78720 Poseidon had brought forth from the rocks with a blow of the trident, and the first olive tree, which Athena had caused to rise on that occasion. [1] Of the eastern façade group, the largest part, and especially the central one, which is of particular importance, had already been lost by Carrey's time. Fortunately, however, the Madrid museum preserves a raised section above a spring from the Roman period, on
78725 which undoubtedly a copy of the central main figures of the group appears. It is far from the case that Phidias, according to the common folk representation found, for example, in vase drawings, would have had a small Athena emerge from the head of Zeus. His concept is much grander. How is it possible that

The artist leaves the question of where she arrived entirely unclear. She is there, standing in her full size before her father, about to rush away, yet not yet completely turned away from him; she is seen almost entirely from the front. Zeus sits on a throne, seen from the side, but he too is somewhat turned forward. These are the two main figures of the group in the center of the facade. Between these two
78735 hovered Nike (the Goddess of Victory), thus beneath the highest ridge of this temple of victory; she joins Athena, whose usual companion she will become; on whose hand she also hovered at the large statue inside the temple. Next to Zeus stands Hephaestus or Prometheus, one of whom, according to the common mythical story, had his head split open with his axe.

Regarding the rest of the composition, we are also not entirely in the dark; the ends of the group are still in relatively good condition. It was on the "many-peaked" Olympus that this great event took place. In the left corner of the facade, Helios, the sun, rose from the sea; already his four steeds were shaking their heads wildly from the waves, and one could see the head and shoulders of the charioteer, who, with
78745 outstretched arms and evidently not without effort, held the reins with which he drew the heads of his impetuous horses toward him. In the other (right) corner, Selene, the moon, calmly sank into the darkness, her head tilted back to cast one last glance over the earth before leaving it. Soon she would be completely gone. Only the heads of her horses remained.

This was the designation of the heavens across which the sun, moon, and stars moved, which, together with the earth, encircled Olympus, the exalted abode of the gods. At the far end of this (left) sat a beautiful youth, a young god, in a pose of the most calm repose, leaning slightly backward and resting his left forearm on a raised surface of the ground; he was more or less devoting his attention to the rising
78755 Helios. Similarly, at the other corner, a goddess in a reclining position gazed at the setting moon. She leaned in the lap and against the breast of a goddess beside her. Beside this goddess sat a third. Similarly, the reclining god had two goddesses beside him. Judging by the panther skin on which he appears to be resting, he must have been Dionysus, and then his two companions were undoubtedly Demeter and her daughter, Kora. Who the three goddesses on the other side are is actually impossible to determine. A figure has been preserved, standing next to the so-called Demeter and Kora; her enormously fluttering dress reveals her vigorous movement. She is mistaken, perhaps not wrongly, for Iris, the messenger of the Gods; a similar figure must have stood on the other side.

This façade group undoubtedly represented the world of the gods, as they were terrified when the Heavenly Maiden suddenly appeared before their eyes. Hephaestus (or Prometheus) at Zeus's side recedes to one side in the Madrid relief. In a similar pose, a female birth deity, an Ilithyia, probably stood on the other side next to Athena, one or more of the same type usually appearing in depictions of the birth of
78770 the Goddess. It is quite likely that the remaining space was completely or partially occupied by Gods or Goddesses, who in some way or another expressed their dismay. We still possess the torso of a male deity, who must have stood at Athena's side. He recoiled, but—as can still be seen from the torso—he had his arm raised and his head directed toward the center of the façade. This could very well have been an attitude of surprise. That the Goddess had only recently appeared is clear. Yet, all of Olympus has not yet noticed what has taken place. The two outermost deities are still gazing ahead at Helios and Selene. Those who follow, however, are already turning somewhat toward the center; the ones who follow feel even more strongly drawn to it. The postures of these four Goddesses clearly show that they had just before turned
78780 their attention to a completely different direction. They do not yet know what is happening; the two Goddesses on the right are apparently making movements to get a good look; the one closest to the center is even about to stand up to do so; on the

other side, the one furthest toward the center turned her head toward her companion, pointing her hand toward the center, apparently a reminder to also look. In the immediate vicinity of Zeus and Athena, as we noted, the gods likely stood, completely stunned by what they saw.

We are now better able to assess the composition of the western facade group, although almost less of it has been preserved than the other. Carrey saw it in a relatively intact state, and besides his, we have another illustration by a draftsman from the same period. The battle between Poseidon and Athena, the great event that made the latter Attica's national deity, had once taken place on the very hill where she was now depicted. Standing before this group of the castle, looking down, one could see the river Cephisos in the plain on the left; in the left corner of the facade, one now also saw this river god emerge from the water to observe what was happening in the castle. On the other side of the castle flowed the small stream Kallirrhoe, a branch of the Ilissos; this female river deity was seen in the other corner of the facade. Thus, there was a certain connection between the illustration and reality. It was the decisive moment in the battle witnessed in this group of gables. Poseidon had most likely caused a spring to gush forth from the ground with his trident; there, in the center of the gable, Athena's olive tree rises, and the god retreats, sensing that he is now vanquished. Similarly, on the other side, the goddess withdraws somewhat, presumably facing the god in a victorious pose. Just as Nike on the other gable stood between Zeus and Athena, so here too the olive tree stood between her and Poseidon. Behind her was her chariot, which Nike apparently steered, while Hermes stood to the side of the horses, deeper within the gable, partially obscured by them. Behind Poseidon also stood his chariot, driven by his spouse, Amphitrite; a female figure—let her be called a Nereid—stood, like Hermes on the other side, beside the horses. Behind Poseidon came Leucothea with the boy Palaemon Melikertes, Thalassa (the Sea) with the still young Aphrodite on her lap, completely naked and with the infant Eros (God of Love) beside her. These were the deities worshipped on the Isthmus of Corinth alongside Poseidon, who was the chief god there. Had Poseidon been victorious, he would have taken possession of Attica with him. Behind Athena's chariot, one has every right to expect deities who, besides her, are most characteristic of Attica, and it is therefore not unlikely that the two female deities represented there were Demeter and Cora, and the youthful naked god—the counterpart of the naked Aphrodite on the other side of the façade—Iakchos, that is, Dionysus in his youth; these were the deities of the famous mysteries of Eleusis in Attica. On Athena's side, Hygieia (Health), who was closely related to Athena, and her father Asclepius (the god of healing) followed, not surprisingly, and correspondingly, on Poseidon's side, behind his associates in the worship of Corinth, presumably the nymph Euryte and her son by Poseidon, Halirrhothios. Then, on both sides, came the river gods in the corners.¹⁾

Already in the arrangement of the figures, we see the astonishing progress art had made in these two façade groups. In the Aeginite groups, for example,¹⁾, the coherence rested on an almost perfect correspondence between the two halves of each group on either side of the central figure, and where the slope of the façade prevented a figure from being placed upright, they were simply placed on their knees, without there always being any real reason for the person being depicted to kneel. In our facades, however, all the figures have a perfectly understandable pose or movement, yet all have one, allowing them to fit perfectly into the place they are meant to occupy. Here too, the unity of the composition is powerfully preserved. It is entirely connected to the center. The warring factions in the western facade focus their attention on the decision that falls in the center; likewise, the river gods in the corners. In the eastern facade, we see a movement that increases from the corners toward the center. At the outermost ends, Helios rises toward the center, but Selene descends facing away from it; the latter, however, as we noted, turns her head toward the earth, which she leaves—a movement in itself quite understandable—and thus also acquires some direction toward the center. Furthermore, the so-called Iris, as she rushes mightily from the center, may almost strive out of the frame of the composition; she was still so captivated by what is happening in the center that she turns her head quite strongly back toward it. Likewise, unity was also maintained in these groups by a certain degree of agreement in the corresponding components on either side of the center of the facade. However, here the artist managed to push the boundaries of diversity to the limit.*) At the ends of the eastern façade, which we still possess, Helios and Selene are certainly similar, yet very different. Following them, on either side, as we know, are three deities. Of two of these, one leans against the other, but on the right side, these are the two outermost, on the left side, the two innermost. Furthermore, the deity looking at Helios in a reclining

position is male and naked; the one gazing at Selene in a similar, though yet again in various respects different, position is female and clothed. Similarly, in corresponding places in the two halves of the western group, similar, yet again rather dissimilar, components could be identified. The aesthetic need for grouping, inherent in our human nature, first reaches its full development here. Variety appealed to the Athenian, yet nothing resonated less with him—we have already seen this in the architectural ornamentation of the temple—than a confused scene, which did not immediately provide a clear impression of the whole, allowing the mind to easily grasp it.

When, at the beginning of this century, the sculptor Daenecker encountered a cast of Dionysus and Cephissus, he declared that he had never "seen anything like it;" they were "formed, according to his expression, as if from nature, and yet he had never had the good fortune to see such natures"; with these words, the artist provided a characterization of Attic artistic idealism that is not much to dispute. What diversity there was, again, in all these figures. While Dionysus's body was a model of youthful vigor, Cephissus, in his limp and drooping flesh, strikingly displayed the character of an aquatic being. What awe-inspiring forms, however, we are confronted with when we consider the sad remains of Poseidon's back and shoulders! Now, Phidias's treatment of the nude is undoubtedly the highest; yet, in the execution of the garment—although his predecessors likely left more to him—he undeniably raised art to its true height. The uniqueness of every pose and movement is also delicately expressed throughout. Who can fail to see, in the blown-back garment of the so-called Iris, the speed with which she rushes forward? The river god Cephissus has with difficulty pulled himself to the edge of his current; he does not move easily outside his element, after all. Of Poseidon's charioteer, we have only the torso; but who can fail to see from it what she is? Understandably, all this could only be achieved through the highest technical skill. There is also no doubt that colors clarified the parts of the figures, which also stood out more powerfully against a colored facade. How much, too, from these facade groups, the spirit of that broader and more enlightened religious conception, which especially characterized the artist's time, blows towards us!1) What a gulf exists between his birth of Athena and the popular representation depicted on vases!2) Even the conception of the western group, according to which the entire battle is decided by the mere appearance of the olive tree, is certainly more poetic than it testifies to a strict adherence to tradition. It is a similar treatment of mythological material as tragedy permits, and here we clearly see again the spiritual affinity of Phidias' art with this. Ancient myth undoubtedly also knew of a formal combat, and an epic poet would certainly have dwelt with great predilection on all sorts of details, for example, having the various arbitrators appointed by Zeus, whom the popular story also mentions, deliver speeches in a dignified parliamentary assembly. Here everything is summed up in one point; It is the moment when things take a turn: the olive tree rises, everything is decided. Striking, but at the same time the myth has almost become something entirely different.

Likewise, the divine figures on these façade groups testify to a higher spiritual freedom. Phidias undoubtedly characterized his gods by attributes, the usual additions through which everyone could easily recognize them; for example, Hermes by his crozier, Poseidon by his trident. Such attributes have been lost from our façade; only Dionysus would still rest on his panther skin. They were probably mostly made of metal. However, these things were not of such paramount importance to the artist as in older art—which often overwhelmed the figures of the gods with them—or in common folklore. He was much more concerned with portraying the gods in the gestures, postures, and bodily forms that their mythological character demanded—as, for example, Athena was sternly maidenly, Hera matronly—and since his predecessors had taken only a few steps in that direction, his imagination was limited almost entirely by that mythological tradition, which naturally allowed considerable leeway. And even with this, he wasn't too particular. According to mythical tradition, Dionysus, for example, was a bearded man; Phidias recreates him as a vigorous youth. Yet, as has already been noted,1) the free-spirited trend of the time, which asserted itself here, still stood entirely on the foundation of popular religion. These ancient myths were, therefore, for the artist something higher than suitable material for a sculptural group. As soon as the "Elgin Marbles" became known, it attracted attention that these statues, intended to stand on a facade, were carved with as much care at the back, where they would never be seen, as at the front. This sheds a very peculiar light on the character of Phidias' art. We vividly sense how much these groups were more than mere decoration of the facade for the artist. It was a serious, sacred task he had to fulfill in their creation; the most important religious traditions for his

- 78915 people had to receive a sublime expression worthy of their dignity, and that they received this was in itself a supreme necessity for him. He had to place them there as established for all ages in a monumental form, and that they truly possessed this in all its perfection was everything. The work, which would not be conspicuous, was nothing less than superfluous.
- 78920 The nearly 160-meter-long frieze, which, in the surrounding gallery of the temple, completely encompassed the interior of the temple, depicted the procession during the festival of the Panathenaia¹), an image, as we have seen²), of the Attic people as it had developed over the centuries. Already in the distribution of this material over
- 78925 the designated space, that Attic sense for a correct and beautiful arrangement reveals itself in all its subtlety. The artist could not conceive of composing this procession as a circular band without beginning or end, like the hunting and battle scenes, modeled after the Oriental style, that adorned, among other places, ancient vases. A procession had to be depicted, going somewhere, but how? Wherever one wanted
- 78930 to place the end of this procession, the beginning would always have to be adjacent, and it was impossible for both to be composed in such a way that the natural gap between them would not forcefully impose itself on the viewer, which would naturally cause the frieze to lose all character of a band. But where should that end be located—undoubtedly the most important part of the procession? Naturally, on the
- 78935 eastern front of the building. But where? At one of the corners? One immediately senses that this is not possible. The center above the main entrance is actually the only fitting place, but there, undoubtedly, the beginning and end of such a procession would be almost grotesquely juxtaposed. Phidias resolves all such objections at once—the full significance of this solution will become clear to us
- 78940 shortly—by dividing the procession into two parts, two columns, both of which converge above the eastern main entrance. One covered the entire west side, then turned northward and arrived at the east side; the other arrived there after first passing along the south side.
- 78945 A cavalry procession was seen on the West Frisian side. Some riders are already mounted; others still need to adjust their equipment, for example, tying on their sandals; or the horses themselves are not yet complete. It is a selection of Attica's youth, who, on beautiful horses—for which Attica was renowned—follow the procession. That these riders also include victors in the competitions—if not all—is beyond
- 78950 doubt. At the end, in the left corner of this west side, a procession organizer leads the riders. This creates a gradual transition to the north frieze, at the beginning of which some riders are still not fully equipped. Soon, however, we see the cavalry riding forward uninterruptedly, though in uneven ranks and without much regularity, so that they clearly do not have a military cavalry before them. This is also evident
- 78955 in the riders' equipment; there is great diversity, from the naked youth, with only a sort of cloak hanging diagonally across his back, to the even more military-style attire. The movements of the horses and riders also lack anything resembling monotony; For example, now a horse throws its head back wildly, then forward again, or the animal jumps completely off the ground. - If one had passed the group of
- 78960 riders, then one came to the agent of the apobats, a runner beside the charioteer²); then a group of sixteen men on foot, among whom were probably the Thallophores, the handsome old man with a branch in his hand, chosen by some kind of contest³); before these marched musicians—this reminds us of the musical competitions instituted by Pericles⁴), until finally they saw before them the great sacrifice being offered to the goddess. Metoici (foreigners under the protection of the state) carried, as skaphephors or hydriaphores, the heavy containers and water jars containing the wet and dry goods necessary for the sacrifice; before these, with their escorts, went the sacrificial animals themselves, sheep and cows, the sacrifice of the Attic colonies. The north frieze ends with these sacrificial animals, and everyone senses that the
- 78970 procession cannot be concluded with this and will therefore continue on the east frieze. The second column, which also proceeded from the southern frieze to the eastern side, opened with a detachment of regular Attic cavalry, a splendid corps composed of well-to-do men who could properly provide horses and equipment. Here, as at the beginning of the northern frieze and throughout the western frieze, the
- 78975 procession was still in preparation; the first horsemen had not yet formed ranks. Now we see clearly what a great advantage the division of the procession into two columns afforded the artist. The gap between the beginning and end of a procession was utterly unmanageable; that between the beginning of two processions, and likewise, as will shortly become apparent, that between their ends, were made almost imperceptible
- 78980 in the composition to the unintentional observer. Undeniably, this division into two

presented the great danger of creating the impression that two entirely separate scenes were depicted on the frieze, but this was entirely avoidable. Phidias had already made his task easier by not having the two columns begin in the middle of the west side, but by assigning the entire western side to one of the two—that of the northern frieze—so that the separation fell on a corner, which naturally always made it less pronounced. Now, however, as we noted, both at the beginning of the southern frieze and on the entire western frieze, one could see a not-yet-organized cavalry procession, and this very similarity in material made the divide less noticeable. While the general direction on the western frieze was north, the movement of riders just mounting, interspersed with others not yet ready, was not particularly forceful. Moreover, here at the southern corner, the artist could have added something that pointed more specifically southward: a few riders, still busy with their equipment, had turned in that direction, and likewise, a reluctant horse, rearing violently, had turned completely. Thus, one gradually reached the south side of the West Frisian as well. Having passed the horsemen, who were not yet in order, one saw regular ranks of six men in diagonal formation before one. Then, however, one came upon some disorganized horsemen again; the front rank had been forced to break up because it had encountered a line of chariots¹) that had participated in the race. Ahead of these chariots walked pedestrians, among whom, not surprisingly, were Thallophores and musicians, who also appeared on the north frieze. Here too, one saw sacrificial animals extending to the end of the frieze, this time to the great sacrifice of the city itself.

Now, if one positioned oneself in front of the east frieze, at the front of the inner temple building, one saw on either side the heads of the two columns, which had turned the corners, moving toward the center of the frieze. On both sides, there was a procession of stately advancing girls, carrying the supplies for the sacrifice, and that the canephors² were among them, there is no doubt. Further toward the center of the frieze, the two columns had already arrived at their destination; for example, a temple official took a dish from one of the front girls, which she had been carrying, and in front of the girls, on either side, stood a group of middle-aged men in a reclining position, most of them leaning on their staffs, waiting for the entire procession to arrive. They were probably dignitaries of the state, although that cannot be said with certainty. Right in the middle of the frieze, the outermost points of the two columns had arrived, at a place that one should imagine as the interior of the temple, just above the entrance to the actual temple. On one side, the right, one sees a boy wearing the peplos, the beautiful robe brought by the goddess has been handed over to a priest, who arranges it in its folds; on the other side, the left side, two girls wear a kind of tabourets on their heads, which they hold by their legs and on which something is placed; a priestess is in the process of taking them from her; one of the girls carries something else on her arm. These girls were most likely the arrephores, and perhaps they brought the goddess her secrets.¹) Moreover, the spectator was fortunate enough to witness a spectacle in this east frieze that was apparently completely hidden from the eyes of the celebrants themselves. The Immortals had descended from Olympus to see the Attic people perform in all their splendor and glory. They sat there in two groups, on either side of that middle group—from the place one might imagine as the inner temple space—facing away from it, looking ahead at the columns approaching from either side.²) One immediately recognizes Zeus and his wife, Hera, on the right, the Castle Goddess herself with Hephaestus. Poseidon and Aphrodite are also clearly distinguishable with the boy Eros (Cupid). The other gods are less certain to be identified. All sat there in an easy, comfortable pose, apparently completely out of the more formal fold; Zeus, for example, who would later be depicted by Phidias at Olympia sitting upright on his throne, here leans comfortably with his left arm over the back of his chair. The Castle Goddess wears none of her usual regalia; only her spear was at her side. Here, therefore, the artist's primary task was to express the essence of the various gods without relying too much on their usual attributes. It was an entire Olympus of fourteen divine figures, whose magnificent beauty the artist had to reinterpret here for his contemporaries, and in every respect, these groups of gods belong to the most exquisite of Phidias's art we know. How utterly lacking, now, in that eastern frieze, where the two columns meet, is anything that could create a sense of separation. Two similar columns move from either side toward the center, followed on either side by these two groups of resting men, followed by the gods; these resting men wait, as it were, before the temple, while, behind the gods, the two outermost spires have penetrated the interior of the temple. This last one was indicated by nothing other than what occurred within it, yet between these two groups of gods, it was sufficiently separated from the rest of the frieze for the viewer's perception.

Because these groups, despite all their differences, nevertheless offered so much similarity that the eye involuntarily connected them, the idea that any boundary should be sought between them could not occur. Thus, the area where the two spires converged presented itself powerfully as a single whole, and since nothing could evoke the impression that it was not connected to the procession behind them, the two columns were firmly held together at their ends. Moreover, these were naturally so small there that the contrast between the two columns was only weakly continued. The artist composed more freely here by having these ends consist of two girls on one side and one boy on the other, so that there was no separation exactly in the middle. This lay between the priest and priestess, who were facing different directions. However, the fact that this had only recently occurred is evident in the priest's posture, and in the depiction, the two belong completely together again, in the place where we find them.

This frieze was only worked in very low relief; the elevation remained below five centimeters overall. This was necessary because, under the ceiling of the surrounding gallery, it naturally received light only from below, and with a greater elevation, the shadows of the lower sections would obscure the upper ones. Only in the latter case did they go slightly above five centimeters by excavating the background a little deeper there. There was a great risk of confusion in the places where the various riders obscured each other. The artist prevented this by excavating the outlines of the figures a little more sharply here and there. This did, however, result in some loss of the plastic character of the figures, as they no longer emerged so gradually from their background, but it was entirely contrary to the essence of the Attic artist to create compositions whose individual figures did not immediately catch the viewer's eye with complete clarity. 1) Undoubtedly, colours were also applied to this frieze, which also enhanced its clarity.

Here too, the figures stood out against a colored background, and several of their details were highlighted by color. Numerous metal additions were also applied. That pure, unmistakable sense of style and that self-control, capable of satisfying the possibilities of every artistic genre, are also strongly evident here, and these were among the most precious gifts of the Attic spirit. Therefore, there are no attempts here to introduce deep perspectives into the reliefs, to have another representation move further into the background behind one image, to give the figures a more or less longitudinal direction from the viewer to the background, sculpting them in foreshortened form, just as a draftsman in a similar case draws in foreshortened form. The artist of the somewhat later frieze from Phigaleia (a city in Arcadia), for example, was unable to refrain from the latter. A centaur, in particular, lying there with its head turned towards the viewer, provides a striking example. Such a foreshortened sculpture naturally acquires a monstrous quality; a figure drawn in foreshortening appears to possess the true form, a foreshortened sculpture also appears foreshortened. Phidias, however, apparently felt no temptation to such deviations. Strictly speaking, for example, the groups of gods on the eastern frieze should not be in line with the procession and its spires in the middle section of the frieze. However, Phidias was so unconcerned with the idea of either omitting these groups of gods or attempting to bring them more forward, so that the procession could, as it were, actually pass behind them, that he even used them in the composition, as we have seen, to create a separation between the procession and its spires.

This carefree deviation from reality is evident in yet another respect. In such a procession, the horsemen and charioteers naturally towered far above the pedestrians. If this were transferred to the frieze, unsightly gaps would be created, and the frieze would no longer visually form a uniform whole. The Attic artist, therefore, simply placed all the heads approximately in a single line (isocephalism), and although this resulted in a significant disproportion in size between horsemen and foot soldiers, a suitable grouping could ensure that it did not become too conspicuous, and in any case, this was by far the lesser of the two drawbacks. Likewise, Phidias was not bothered that the Panathenaic procession did not actually proceed to the castle in two columns, nor did he feel compelled to depict every element of the procession with meticulous precision. It was entirely different matters that captivated the artist's mind. In that procession, the Attic people appeared in their most select representatives; here, on that temple frieze, an uninterrupted scene of the highest beauty unfolded before the eyes of the beholder! Here, youth, middle age, and old age shone before gods and men, each in its own peculiar splendor. Magnificent sacrificial animals, often with characterful movements, were led to the castle. Only Attica, with its beautiful horses, could

produce such a cavalcade. What diversity it offered! The horse connoisseur could find here the movements for which these animals were usually trained; besides, however, one saw numerous others, in which the nature of the animal was more exclusively expressed; in all, each time changing, an image of magnificent beauty was presented. What a feeling of rapture flowed through them. An Athenian to the heart—like a true Hellene—when he had to confess how glorious the earth truly was, and how unspeakably happy he felt at the thought that all that beauty was truly produced by his homeland.

2) Even among the two or three hundred human figures that appeared there, a great diversity prevailed, yet one single spirit pervaded the entire scene: stately and solemn, the people proceeded toward the castle, the deepest seriousness prevailed everywhere, everything spoke of a sacred act being performed there. And indeed, not only were the most precious offerings made there to the Patron Goddess, but the scene of splendor and beauty that the brilliant procession unfolded in its performance was in itself a tribute to the Immortals,¹⁾ whose presence all deeply felt, even if, like us, they were not fortunate enough to behold it with their own eyes. How could one not have arranged one's attire in a stately manner? With all the freedom of movement one allowed oneself, one could not have observed moderation, full of dignity and self-confidence! In quiet modesty, that select procession of maidens proceeded there; with confidence and proud composure, the heavenly-beautiful youth dominated on his horse; quiet self-possession spoke from the posture and gestures of the men. It was the people of Pericles, shining there before the eyes of the Immortals—a glorious image of majestic beauty—the people of Pericles, as he also led them when he appeared in the assembly; it was, in a word, an Olympian people. Thus, it was primarily in his higher qualities that Phidias portrayed that glorious, ostentatious image of his people, and we vividly sense how much the man, who even in his external compositions acted primarily according to his artistic inspirations, thereby elevates himself above reality. And something else is closely related to this. Despite all the diversity we admire in this frieze, each of those numerous figures exists solely for the sake of the procession; all actions, postures, and gestures can be connected to it. Likewise, anything that even hints at the characterization of specific figures is absent; above all, the facial features reveal nothing individual. Thus, any thought of this or that Panathenaic procession is entirely excluded here, and we see it, so to speak, in its eternal form, elevated above all chance. Not only where he depicted the figures of Olympus, but also where, as in this *Mes*, he had to depict the events of reality that each of his contemporaries could witness with their own eyes, Phidias was an idealistic artist in the strictest sense.

Illuminated by the bright light that fell through the large opening in the roof, one saw before them in the interior of the temple the heavenly maiden Athena in all her stately power and divine beauty; only in the large temple sculptures, where the Deity appeared in all the magnitude of her dignity, could Phidias unfold his full power as an interpreter of the divine. It was already a magnificent sight, that ten-meter-high statue on a two-meter pedestal; the nude parts, face, arms, and feet were made of ivory; the dress and other accoutrements were of hammered gold; the whole thing stood out clearly against the red-colored wall behind it. We can form some idea of the composition not only from the descriptions but also from copies, including two fairly faithful ones, and depictions on reliefs, cameos, and coins. The pedestal depicted the birth of Pandora, the first woman, who was immediately instructed in the art of weaving by Athena. The goddess's attire is also exceptionally richly decorated. A magnificent piece was her helmet with its sphinx between two winged horses; around her sandals, a battle of Lapiths and Centaurs was depicted. On the outside of her shield was a battle of heroes and Amazons, on the inside, that of gods and giants.

How could Phidias display his skill as a chiseler in all this! The Athenians refused to allow him to place his name on this statue. He compensated himself for this by placing his own portrait and that of Pericles among the fighting heroes in the Amazon camp. On a copy of this shield in the British Museum, one can still clearly recognize both Phidias himself, a bald old man, and Pericles, who partially obscures his face with his raised arm—Phidias apparently wanted what he had done to be less conspicuous. It was entirely a deity in the higher religious imagery one saw before us in Phidias's statue. She stood there in silent majesty, calm, without any conspicuous movement. She supported herself primarily on her left foot; her right leg was slightly raised; this only slightly broke the upright shape of her robe. She had placed her shield beside her on her left side, briefly holding it with her hand. Behind it, in the familiar form of a serpent, coiled Erichthonius, the progenitor of the Attic people, himself Athena's foster-child, just as the Attic people were under her care. Her spear rested against her left shoulder. In her right hand, she held

79180 Nike, the goddess of victory, slightly out in front of her. Indeed, the various capacities in which she could appear were here somewhat related to a higher whole. Was the Parthenon a kind of synthesis of the old house of Erechtheus, the temple of Athena as the Guardian Goddess, and the small temple of Athena-Nike1) on the slope of the castle?—in the image of the Goddess in the Parthenon, the essence of the Guardian Goddess and the Goddess of Victory were united, and likewise, the representation on
79185 the pedestal recalled that the same divine being was also the "artistic one," the "Ergane," as such, as she too possessed a sanctuary in the castle. Now, in all this, the artist undoubtedly had portrayed her, above all, as a heavenly maiden (Pallas) Athena had been known (or rather, made known by the name of Athena), then he would have characterized her primarily in her most general nature.

79190 But Athena, in all her sublimity, offered only a weakened image of the lofty qualities of her father, Zeus, and thus seemed destined, as it were, to approach humanity more closely than these. It was given to Phidias to depict that immense being in forms worthy of his majesty, specifically at Olympia, as the "supreme god of
79195 all Hellenism,"[2] which found its principal religious and national center there. Everything surpassed the grand splendor with which the statue itself, also of gold and ivory, and the extensive additional work were executed. Here Zeus sat on his throne in a moment of solemn majesty, a Nike hovering from his right hand. The statue, with its pedestal, was approximately fourteen meters high and seemed even
79200 larger; Parthenos, which stood, reached, as we noted, a height of about twelve meters. Undoubtedly, the grander religious conception was also somewhat rooted in ancient religious tradition, especially with the "father of gods and men"1). In Homer, Zeus was undoubtedly much more reclusive in majesty and quiet in movement than the other gods, and according to the usual story, Phidias himself claimed to have
79205 arrived at his conception of that supreme divine majesty through a passage from that poet. When Thetis asked him for a favor, Zeus consented with benevolent majesty; he waved his eyebrows—according to Homer—so that his hair waved along his head, thereby making the entire Olympus tremble2). That was that divine majesty that held men and gods in awe and caused his will to be carried out without requiring any effort on his
79210 part. It's a pity we don't possess any actual sculpture that can be considered a definitive copy of Phidias's. Even the well-known Zeus of Otricoli is undoubtedly only remotely so; that lion-like type it has, especially in those mane-like locks, is certainly not by Phidias. Such a special individualization as that of a human with an animal type, however authentically drawn from nature, was not yet in the artist's
79215 sphere, and above all—his gods were merely the sublime expression of the universally human. Fortunately, Elian coins have preserved for us not only a depiction of the whole, but also of the head of Zeus. That small work of art still speaks to us, at least to some extent, of that silent, awe-inspiring majesty and heavenly goodness—that true revelation of a supreme majesty, as unmoved as the atmosphere of Olympus—that caused so many to raise their heads in stunned reverence to that temple statue.
79220 It was a significant moment when it stood there, completed for the first time, in the Temple of Zeus: Hellenic idealism had reached the highest point it could reach. A beautiful Elian saga depicts Phidias, kneeling before his statue, asking the god himself for his judgment on it.
79225 There, Zeus's lightning strikes the artist. The god has spoken and affixed his seal to the work.
The master was permitted to place his name on it.

79230 However, Phidias's work at Olympia is of a somewhat later date. After that magnificent temple on the fortress of Athens, the Parthenon with all its sculptures, was completed and dedicated during the great Panathenaia of the year 438, it gradually came into full use. Besides serving at that important annual city festival—celebrated every four years with even greater splendor—it was also, as has been noted1), intended to hold the prodigious treasures that constituted the goddess's
79235 possession: her money—she had a substantial annual income; consider, for example, only the sixtieth of all tributes paid to her by allies2), and the votive offerings she had received over time and in ever-increasing quantities. These latter were almost all brought there from the house of Erechtheus and the small temple of Athena Nike. A prodigious mass of gold and silver vessels, weapons, necklaces set with
79240 precious stones, and numerous other feminine adornments in beautiful caskets, golden statuettes of all kinds, especially magnificent otter tools, and the necessities for the grand procession—all of this and much more adorned the "pre-temple" (Proneos) and the two parts of the inner temple space, the "Hekatompedos" and the "Parthenon" in the narrower sense. Everything concerning the sacred treasures was arranged on a

79245 fixed basis. We still possess the relevant popular decree. 3) Apparently, a great
deal of sacred money had been used before that time—"borrowed" from Athena and the
other gods. This now remained largely be returned, and from then on, the Goddess's
treasurers would manage their affairs in the "Secret House" (Opisthodomos), where the
79250 Goddess's money would also be kept. A board of "Treasurers of the other Gods" was
established, who would also manage their affairs in the Secret House, opposite
Athena's, and would keep their funds. Administrative regulations were established for
both. Thus, we still possess, in relatively good condition, most of the inventories
with which, in accordance with this financial arrangement—which existed until the end
79255 of the Peloponnesian War—the Goddess's valuables were transferred to their successors
by the various boards of treasurers—an annual office—according to a fixed model and
in a specific manner. It was further determined for what purposes and up to what
amount funds from the Goddess's treasury could be spent, understandably for purposes
such as further beautification of the castle and the provision of instruments for
worship. No one was allowed to propose any other use for that money unless they had
79260 first been granted indemnity (ἀδελία) to make such a proposal. The goddess was then
considered to be lending such money to the Athenian state and received interest
(between 1 and 2 percent). We still possess a kind of promissory note for such
loans²⁾ and for accrued interest³⁾. Likewise, her people could count on her valuables
in times of need, even on the gold of her statue, which, on the advice of Pericles,
79265 had been crafted so that it could be taken away. Thus, even with her material
resources, she was Athens' patron goddess. In all this, a naive faith that knew no
doubt still speaks; yet it is quite striking here how weak the boundary between the
sacred and the profane could become in a religion like the Greek, especially in the
later development of more enlightened times. How much did Attica and Greece owe to
79270 the mighty genius of the Attic artist! It may seem surprising that so little is known
about the life of such a man. This, however, is true of all artists of antiquity, and
there is a very natural reason for this. Art was considered a craft, and since all
crafts were held in very low esteem in antiquity, the artist, although the Greeks
owed him the satisfaction of their highest needs, nevertheless enjoyed only limited
79275 social standing. No well-born Greek youth who used his intellect—as we read in two
ancient writers, Plutarch¹⁾ and Lucian²⁾,—felt the desire to become an artist himself
at the sight of Olympian Zeus or the works of Polykleitos. This was a prejudice from
the old chivalric period, which even outlived the glory of the Attic democracy for
centuries. Phidias, through his association with Pericles, came somewhat more to the
79280 fore than other artists; Yet he, too, was still considered one of that vast body of
artisans whose personalities, understandably enough, aroused little interest.
But does the artist, whom we can still get to know so well through his works after
twenty centuries, have any cause for complaint? It is still perfectly clear to us
what Phidias' art was in his time and for his people. It stood at the end of a
79285 thousand-year-old period of popular development, a ripe fruit of the Hellenic and
Attic spirit, nurtured in a period of the highest development of national vitality,
sufficient to meet both the more practical and the higher needs of his people.
Everything seemed to have to cooperate to make it possible at a given moment.
It was, therefore, only in a short space of time that this product of so many
79290 centuries could come into being. A decline soon set in, in which all the conditions
and circumstances that had contributed to it disappeared in a relatively short time.
The. Storms broke out, whose approach had already been announced during the work
itself, and one of the first victims was the artist himself. It was about seven years
after the completion of the Parthenon—Phidias had undoubtedly only recently returned
79295 from Elis—when charges were brought against him for having stolen part of the gold
intended for the statue of Athena Parthenos. At the instigation of Phidias' enemies,
one of his former workmen, Menon—who tells you that the master, like Michelangelo
later, was not a very strict master to his subordinates?—sat down in the marketplace,
begging the people for protection, as he had something to report about Phidias but
79300 did not dare to do so. The people agreed, and so Menon acted against his former
master. However, this accusation of theft was not accepted. The gold could indeed be
taken from the statue, and Pericles invited the accusers to weigh it. Yet, this did
not acquit Phidias. The anger against him was primarily fueled by the fact that he
had depicted himself and Pericles among the demigods fighting the Amazons on the
79305 shield of the Parthenos. Phidias was taken to prison, where he died of illness. Menon
received, as a reward, exemption from all state charges and was placed under the
special protection of the ten strategists (army leaders) by the people. It was in
Elis that the memory of the great artist was honored—his descendants were there
appointed the hereditary honorary office of caring for the maintenance of the great
79310 statue of Zeus (as Phaedruntes).

The attack on Phidias had primarily been a test to determine the popular sentiment toward Pericles. The way Menon was allowed to act was also calculated to arouse the people's jealousy against Pericles. What did the much-vaunted rule of the community mean if they dared not accuse someone who had committed offenses against it, simply because he was Pericles' friend? By having Phidias arrested and rewarding Menon, the Attic people had now clearly demonstrated that they would not relinquish their high authority to anyone, and the terrain now seemed ripe for further attack. The actor Hermippus brought charges against Aspasia, accusing her of impiety and deceiving free Athenian women, whom she—this interpretation was given to mean that she received women and girls for instructional purposes—had shamefully enticed to her side in order to appease Pericles. Thereupon, at the suggestion of Diopeithes, the people passed a decree that atheists and those who supposedly taught about supernatural things would be prosecuted in the strictest manner. This referred to Anaxagoras, and this, in turn, was to refer to Pericles. Finally, a decree was immediately passed against him as well. At the suggestion of Drakontidas—slightly modified by Hagnon—he would have to render an extra account for his management of funds. A significant role in all this undoubtedly played by petty jealousy. This thus exalted workman, Phidias, was quite naturally the object of many's jealousy; he had even dared to equate himself and his friend with demigods; and how could Pericles himself have escaped the envy? Yet those men who acted there in a closed phalanx against Pericles and all that belonged to his party—however much malicious malice they may have displayed—were not primarily motivated by selfish passions. Hermippus, as has been noted, was a man of a truly conservative persuasion, Diopeithes a religious zealot, Drakontidas, it seems, a declared enemy of democracy. It was the entire trend of old Athens that was here vigorously opposing the newer; it was, so to speak, the trend of the old house of Erechtheus against that of the Parthenon. That old Athens did not triumph over the new. Pericles could only save Anaxagoras by expelling him from the city, but Aspasia was acquitted, and undoubtedly—though we are not told—he himself was as well. With all this, however, the time when the Attic people allowed themselves to be led uninhibitedly by the Olympian was over for good, and undoubtedly many had now come to the conviction that this new, higher spiritual direction must lead to a renunciation of the Gods. Meanwhile,—and how could it be otherwise?—the tension between Athens and the Peloponnesians had also increased again. Numerous clashes had arisen, and the situation had become such that, if Athens wanted to maintain its high position, war was inevitable. It was Pericles, above all, who believed that this was the time to let it happen. Athens had never been better equipped to conduct this than then; surprisingly, the resources it could rely on made its position almost unassailable. Only fourteen years of the thirty-year truce had elapsed when war with the Peloponnesians broke out again. Many in Athens believed that Pericles had been driven to war primarily because he hoped to restore his shattered prestige, as the people would then be less able to do without his forceful leadership than ever before. Who can say that such considerations could not have been a contributing factor, although they were undoubtedly not the primary motivation? In any case, during the war, discontent against Pericles increased significantly; people felt oppressed by its burdens and directed all their discontent against the man on whose advice they had begun to seek him. He was fined and, after serving as strategist for several years, removed from supreme command. He was soon recalled, and in the latter part of his life he enjoyed some satisfaction in other respects, but his time was effectively over when a plague, which at that time wreaked havoc in Athens, took him away as well (429 BC). It is a sad spectacle to see how everything that had once defined Pericles's strength or filled the great statesman with hope has faded away. After this period, there is little left of a free citizenry, held together and guided in a fixed direction by awe for spiritual superiority and reverence for what is recognized as higher and better. Democracy, first and foremost, wants to be itself, and everything is striving for unity and drifting back and forth, now that the zeal to assert itself as supreme sovereign completely dominates the community, and everything that seems to be happening at the moment is immediately pursued with passion. One should certainly not blame too much on a few individuals. Couldn't a Kleon or Hyperbolos, whom Avas was capable of, lead the people, now that the scepter had almost fallen from the hands of the Olympian? Pericles had entered the war with the highest hopes; if the Attic people can control itself, if it doesn't shy away from effort, but also doesn't allow itself to be lured into futile undertakings beyond its powers, it will undoubtedly emerge victorious from the battle! However, the Attic people lacked self-control; they grumbled about their efforts, throwing themselves into futile undertakings that

held a certain charm for the imagination. Instead, the best of the people's strengths opted for it, and—with impunity, they could commit numerous errors against the rules prescribed by Pericles, so prodigious were their resources. They committed so many, however, that finally the Peloponnesians entered the city, the long walls were demolished, and their fleet was burned before their eyes, while the Attic alliance had also disintegrated, and the Asia Minor Greeks stood unprotected against the barbarians. Everything that had once filled the soul of the Athenian with such a high sense of self had been destroyed.

It goes without saying that the consequences of the disasters that befell the city were deeply felt, especially in the rear of Athena's temple. As we have seen, we still have numerous debts of debt for borrowed sacred money and accrued interest; they are especially relevant to this period. Already at the beginning of the war, this practice of borrowing began, and later it repeated itself incessantly; naturally, the indemnity to propose such a loan was repeatedly requested and received. Thus, the treasures in the castle gradually melted away. After a while, it seems, the interest rate was demanded. Ultimately, whatever came in was immediately used for loans. Already at the beginning of the war, it had been determined that at least the 1,000 talents would remain untouched; a proposal to borrow even from them was prohibited under penalty of death, except in the event that an enemy fleet approached the city. Similarly, 100 ships were designated, which could only be equipped in that case, and then with that money. Later, even though no enemy fleet was approaching yet, the need became dire. The threat of death was lifted; the ships were used for other purposes; the 1,000 talents were used. Nor could the goddess's treasures be spared in the long run. For a long time, these treasures were kept at bay; indeed, quite a bit was added—the inventories we still possess inform us of this. This is coming to an end; some items disappear; the final entry in the last inventory of the Proneos's treasures under this arrangement states that everything had been transferred to the Hellenotamia, for waging war: "one golden wreath remains, weight as much." What happened to the Proneos's treasures undoubtedly happened—although we lack the inventories of those very last periods—also to those of the Hekatompedos and the Parthenon. Thus, Athens's wealth evaporated, and now that its naval dominance had collapsed, all hope of complete restoration vanished. The material conditions that had once made Phidias's works of art possible had also vanished. Several times later, new financial arrangements were made; inventories were again drawn up—we possess quite a few of these as well—and indeed, at times, quite a few valuables were amassed. However, the Patron Goddess never received a treasure even remotely comparable to the one she had possessed. She, too, was deeply affected by the misfortunes of her people.

But the power of downfall reached infinitely deeper. Not without reason had Pericles' enemies directed their attacks against Anaxagoras. Indeed, the close contact between the more enlightened religious way of thinking and the stricter philosophy was very dangerous for the popular religion. In such matters, conservatism is usually felt to be infinitely more correct than the more liberal approach. One of the philosophical schools of that time, that of the southern Italian city of Elea, was already very clearly in conflict with the popular religion. Its founder, Xenophanes, even railed against the old polytheism with a certain ferocity, and if, it seems, the other Eleatic philosophers expressed themselves less on the subject, it was not unlikely, because they were no longer so passionate about such matters. One of the most prominent of these Eleatic philosophers was Zeno, who also lived in Athens and, as we know, associated with Pericles there. Xenophanes claimed, for example, that if cows, lions, and horses had hands, they would depict the gods as lions, cows, and horses. How this simultaneously destroys the entire foundation of Greek religion and all of Greek art! Philosophy increasingly withdrew the best intellectual forces from the popular religion, and those philosophers who did not break with it nevertheless failed to grasp it in its true character. Was it any wonder that he increasingly yielded to his natural tendency to lower the standard of the divine? Phidias himself did not hesitate to place himself and his friend on the shield of Parthenos among the demigods. One only had to continue on this path to arrive at the vulgar human deification of the Roman Empire. And indeed, the world of the gods now increasingly sank to the level of that of humans, so that ultimately, elevating a human to the status of god became a very common occurrence. The history of the Parthenon and its festival also shows us the Greek folk religion moving in this direction. At the end of the 10th century BC, the Athenian people decreed that Antigonus and his son Demetrius would be honored as gods with sacrifices, games, and a procession, and that their images would appear in the embroidery on the goddess's magnificent robe, the

peplos, alongside her and Zeus himself, as divine participants in the battle against the Giants. At the time, many still found this deeply offensive; it was considered a divine judgment that a gust of wind caused a large gust of wind to tear the magnificent robe during the procession, and a severe sleet was considered a punishment from the gods, causing considerable damage to trees and crops. All such sentiments later faded. Centuries before this had happened, however, relatively shortly after Athens's peak, when the retrograde of popular religion was still only in its infancy, it no longer offered the artist such lofty and austere ideals of the divine as it had once done in the time of Phidias.

Yet, despite all this, the creative power of the Hellenic and Attic spirit was far from exhausted. Greek visual art, in particular, continually unfolds new strength and splendor amidst all the religious, political, and social decline, amidst all the material and moral misery that so largely befell Hellas and Attica after that period of greatest prosperity. Once elevated to a high position by the power of national and religious inspiration, it managed to maintain and develop, so much so that in many respects it only now reached its highest perfection. It also underwent the influence of the changes of the times, in some ways even to its advantage. For Phidias, art was still more a means than an end. He wanted to present the gods of Olympus to his contemporaries as if before their eyes, and he gave them a heavenly, beautiful form because without it, he could not conceive of a deity. This was, without a doubt, the most serious stance an artist could take. Yet, a new path of free development was opened up for his successors, now that they were no longer so captivated by such lofty concepts. In later artists, beauty itself became the primary goal, and where Phidias had indicated with powerful strokes, they developed and refined; the wealth of beautiful forms was astonishing, now that these were sought more for their own sake than for the divine forms they had to depict. Furthermore, if Phidias had attempted to portray the diverse character of the gods in bodily forms, postures, and gestures, his soul was too dominated by the general ideal of reclusive divine majesty to proceed far along that path of specialization. Now now the world of the gods came closer to men and became much more like them in every respect.

When it became uniform, it could also much more easily become the interpretation of the latter in all its colorful diversity, while for a long time there remained enough idealism to make the artist strive for the glorification of the forms that nature produces. Only then did Aphrodite become the truly feminine beauty, full of the radiance of life, which she, according to her nature, should be; Apollo the powerful, proud youth, in whom everything speaks of noble self-esteem and spiritual strength; Dionysus the more effeminate, whose beauty smacks of the feminine, just as Hera shines in her matronly majesty, Athena in stern maidenhood. Only then, in a word, did Greek art in its fullest extent reveal to our generation the glory of human appearance in its inexhaustible wealth of beauty.

But at the beginning of all this stands that mighty Attic hero of art. It was he who first taught the visual arts its true calling: to interpret nature by idealizing it; through him, above all, humanity achieved a new victory over nature, learned to know and spiritually master it; and if Greek art truly revived subsequent generations many times over, it was primarily enabled to do so by the stamp he left upon it. Therefore, because Greek art, as it was through Phidias, has so powerfully moved our modern times, because the master inspired a Michelangelo and Raphael, albeit often only through the most distant shadows of what he was capable of—therefore, even if the remains of his masterpieces were not in the Elgin Room of the British Museum, his spirit would surely live on among us—even if he were for us little more than a vague shadow from the distant past, of whom we could never know in any satisfactory way what he was to us.

Leiden.
A.E.J. HOLWERDA.

December 17, 1886 EDUCATION. In the "Ned. Spectator," Dr. A. E. J. Holwerda champions Greek and says, among other things, about our young students:

"Generally speaking, there's far too much 'studying'; our country, in particular, could certainly do without a few lawyers. It has become clear that examinations are a highly inadequate means of weeding out unsuitable individuals. How many a dimwitted youngster is so polished up by his tutor that the faculty is forced to accept him, whether they like it or not? Even the grammar school can't do everything in this regard, but certainly more than the university. How many complaints of overload are based on the fact that completely unsuitable individuals go to university? Climbing Mount Parnasus is no longer difficult in the Netherlands—there's a cog railway on that mountain too—now all we need is science, and we will become small by the

- 79510 opposite of what made the Greeks great, who, after all, achieved their mastery of art and their relatively high level of development in science through "... through tireless, deeply earnest effort."
- January 15, 1895, Royal Academy of Sciences.
- 79515 The literary department held an ordinary meeting today, chaired by Professor Kern, at the Trippenhuis here. A letter was received from the Minister of Internal Affairs in response to a letter from the Geographical Society, stating that Mr. Van Limburg Stirum had been appointed as the government's representative for the upcoming geographical congress.
- 79520 Furthermore, a letter from Mr. Six was received, stating that, having reached the age of 60, he was becoming a retired member.
- Finally, it was announced that 11 entries had been received for the Latin Poetry competition.
- 79525 Professor Allard Pierson announced that he had traveled abroad due to illness and was therefore unable to attend the meeting. The next item on the agenda was a lecture by Dr. A. E. S. Holwerda of Leiden.
- On the sanctuary and mysteries of Eleusis.
- 79530 The lecture began with a description of the site where the Eleusinian sanctuary was built. It was reachable from Athens in four hours and situated on a small plateau south of the sacred grove with its sacred spring. The temples and other buildings towered above a formidable bulwark of steep rocks, and nowhere did the words seem to be shouted more powerfully to the wanderer: "Keep away, you profane."
- 79535 Virtually nothing remains of the temple's former grandeur, and a few huts and a shabby little church have risen from its ruins. The society of amateurs founded in England in the previous century commissioned some excavations. It was believed that mysterious cellars had been discovered and it was thought that the main building of the Eleusinian sanctuary, with its numerous columns, must have resembled an Egyptian rather than a Greek temple.
- 79540 Only from 1882 to 1893 was the entire sacred site sufficiently excavated at the expense of a Greek archaeological society. The work was conducted under the direction of Philias. Many sculptures and inscriptions were discovered, and the foundations of the numerous buildings have become fully known through these excavations. The Proverb called particular attention to the main building. In its deepest depths, the foundations of the oldest building for initiations, the Telesterion, have been found,
- 79545 founded long before the 6th century BC. These can then be distinguished from the square building with its 25 columns, the temple, which was destroyed by the Persians; then the foundations for a new Telesterion, whose construction began in the period after the Persian Wars, before Pericles, but was not completed. The outline of the large building, erected in Pericles' time, has now been completely exposed, as have the foundations of the stoad, which was later added to the main building. According to Aristides, the Telesterion burned in the 2nd century AD. To create space for the structure, the rock must have been partially excavated. Eight staircases were carved into the rock interior, and two smaller temples must have stood on the north side.
- 79550 Even after the excavations, the Telesterion's interior remained a mystery.
- 79555 The author knew that the main section was the "Anaktoron" (anatomical structure); but they also found references to "Anaktora" (plural), from which mysterious voices sounded, opening and closing, causing it to alternate between darkness and light, and so on. The "anaktora" were simply not imaginable. Even after the excavation, the idea of an Egyptian temple was not abandoned, even though it was known that the ceiling
- 79560 must have been partially open. Space also had to be found for a stage, where the mystical drama was always performed; the stairs were designated as the seats for the spectators. Some have believed they could deduce from Plutarch that the Eleusinian temple had two stories; in short, the excavations have made the matter even murkier than it already was.
- 79565 The Proverbs now set themselves the task of finding a solution according to the information from the writers and the remains of the temple, and arrived at different results. The "anaktoron" must have been the actual stage, whose platform was probably placed approximately 3 meters above the ground floor. And the stairs were not seats but offered standing places, each row 20 cm higher than the previous one, so that the
- 79570 spectators could see clearly over each other's heads onto the stage. That is also why the columns were erected so far apart to obstruct the view of the stage as little as possible. Those who participated in the mystical drama on stage, the priests, emerged from the space below through an opening in the platform, for the stage was also the sacred place of initiation, where the sacred objects were shown to visitors. However,

79575 the following questions remain: why a platform was carved into the rock behind the temple; why one of the stairs leading to it has such a slight incline; how the location of the small temple in the immediate vicinity of that platform should be explained; and still, how one could speak of "anaktoron" in the plural.

79580 The answers to these questions are closely related. From passages in Hesychius, the author demonstrates that "anaktora" referred to small portable temples located within the permanent temple building. When the "anaktoron" was to be used for the performance of the drama, the portable temples were removed from the platform; when they were needed again for the ceremonies, they were carried back there. It now also becomes understandable that one reads how a priest sometimes emerged from an

79585 "Anaktoron"; he was then seated in such a small temple building and emerged when the door was opened. While the priest was seated in the small "Anaktoron," he would sometimes sing or shout something. Lights burned in these small temples, while during the ceremonies inside the temple building it was otherwise completely dark. So, if a door of one of the small temples was opened, the entire building was illuminated.

79590 This also explains many obscure inscriptions today. Secret things were kept in these "Anaktora," and during the Great Mysteries, they were transported in processions on chariots to Athens and from there back to Eleusis. The aforementioned staircase with its gentle slope and the platform were probably used to transport this rather heavy "Anaktora" outside. A movable bridge of 13 meters

79595 in length, between the door and the back wall of the temple and the platform would have made it possible to remove the "Anaktora," even when the stage was intended for dramatic scenes. And the small temple on the edge of the plateau could have served as a storage place for the "Anaktora" on such occasions. Viewed from the outside, the Eleusinian temple must not have presented an impressive sight; it was a low, square

79600 building with blank walls. Only initiates were allowed to cross the threshold. Thus, an old invoice for repairs to the temple, dating from the fourth century BC, lists expenses for the dedication of five workmen. Plutarch's indications suggest that inside the building, the walls surrounding the temple were painted with scenes of the underworld and the islands of the blessed.

79605 Based on the authors and the now-acquired knowledge of the meaning of several previously obscure expressions, the author provides: Now a description of the solemnity of the Eleusinian Mysteries themselves. There were certain degrees of initiation: the highest was the contemplation of the sacred objects in the "Anaktora." These were shown on a specific day to the few who

79610 had reached this degree of initiation. This was preceded by the consecration in the Lesser Mysteries of Agrai; and shortly before, the sacred drink had been consumed in the forecourt; the sacred bread had been taken from the sacred chest, eaten of it, and placed back in the sacred basket, and from that back into the sacred chest. The torch-bearing priest had spread the sheepskin of purification before their feet, and

79615 they had seated themselves on it. They had prepared themselves by fasting and immersion in the sea, and for days on end, the most precious sacrificial animals, some adorned with gold ornaments, had been slaughtered. The goddesses had been carried from Eleusis to Athens and from there, surrounded by dense crowds, returned to Eleusis. The cries and hum of voices

79620 as they ascended to the holy place had echoed from afar until the evening before the momentous day. And that evening, in the sacred grove, dances had been performed; by the light of torches, the search for the lovely Kore had been reenacted. And now the people streamed into the temple; they jostled for a good seat on the steps; they recognized friends from old and chatted most animatedly until the hour of the mysteries approached. The sun was sinking; within the building, the shadows rose

79625 higher and higher, until finally, complete darkness fell. People held their breath. Through the opening in the stage deck, a gleam of torches shot upward; The Eleusinian priesthood, in full regalia, appears, headed by the hierophants, dressed in long, trailing robes, their hair flowing over their shoulders, bound by a diadem. They are

79630 the descendants of the hero who once dared to wage war against even the king of the city, Erechtheus. The instructions of the hierophants are inspired by the Deity himself; they have forever abandoned their civil name. The priests stride slowly and stately across the stage; sacred ceremonies are performed; explanatory words are spoken by the hierophant, the incense fills the

79635 space and continues to float upward in mists, in which the torchlight plays ghostly. Solemn chants resound, and the crowd responds with short forms from two to three thousand mouths. And on the day of the mystical drama, other figures emerge from the opening in the platform. One sees Zeus and Pluto, who steal the lovely Kore. The grieving mother

79640 goes in search of the lost daughter. Heartbreaking lamentations make one share her

pain. One lived the life of the Deity itself and learned the nobility of maternal sorrow.

A mighty blow on a sounding board becomes the signal for the small procession to move to a specific point. Enters Hermes, who brought the girl herself, Kore, back to her

mother. The weight of deepest sorrow is lifted from the soul. And on the day of the highest ceremony, only the few initiated, the chosen ones, take their places on the steps; mysterious voices sound from the "Anaktora"; now and then, burning torches were raised from these temples, briefly shedding light in the darkness; all this, however, for the time being, behind a translucent curtain.

Finally, this was pushed aside, and the hierophant appeared, who, striding past the temples, showed the initiates the sacred things about which no Greek mouth has ever revealed to posterity.

This most intimate ceremony was followed by a final performance, open to all. Then, among other things, a water jar was emptied onto the stage, and the priests muttered prayers.

The sacred mystery of Eleusis was over, and, impressed by the ceremony, they began their return journey.

Heading towards turbulent Athens.

Mr. Holwerda's captivating speech was met with applause, after which Mr. Land noted that even in the Greek church, the ministers always remain standing, so the spectators standing on the steps need not seem unusual.

Mr. Tiele argued that it was not the case that sermons or anything similar were delivered at the Eleusinian Mysteries.

The speaker replied that one should not cling too closely to the modern concept of sermon; however, there are passages showing that sermons did indeed take place. The meeting was then closed after a round of questions.

April 8, 1896 By Royal Decree, Dr. A. E. J. Holwerda, a lecturer at the five-year higher civic school in Leiden, was appointed professor in the Faculty of Arts and Philosophy at Leiden State University, to teach archaeology and ancient history.

April 30, 1896 Historical Sciences.

This afternoon at two o'clock, Dr. A. K. J. Holwerda accepted the professorship in the Faculty of Arts at Leiden University, with an address, delivered in the main auditorium of the academy, on: "The Historical Sciences, in particular those of classical antiquity; their independence and significance."

Every era has its dominant intellectual trend; ours may well be called the era of the natural sciences. Yet, therein lies a one-sidedness that has caused the great significance of the historical sciences to be far too little appreciated. The speaker included among these historical sciences all those concerned with religion, language, art, literature, state, and society. The power and scope of these sciences has increased particularly since the middle of the last century; it has been difficult

for historical appreciation to break through. The men who have made a significant contribution in this field are remembered. First and foremost, to him belongs the truly extraordinary man, the first to point the way in this direction, Jakob Perizonius, who discovered a fundamental principle of historical criticism. Niebuhr

is remembered after him, while even before him, Johan Joachim Winckelmann conceived the idea of art history in its full scope. This liberated the mind from the power of rationalism, enabled it to move more freely, and led to the development of the genetic method of explanation and the comparative method.

This character of movement has, remarkably, remained hidden from many scientists. Natural science also sought to impose its method on historical studies, and there

were those, like Comte Buckel, who were struck by this shortsightedness. Du Bois Raymond's ignorabimus was heresy for scientific orthodoxy. Ottokar Lorenz attempted to steer the study of history onto the right track. People have tried to observe and apply laws in the field of history as well, but this preconceived notion naturally causes both the presentation of facts and the entire method to suffer greatly. The

speaker demonstrates that finding laws cannot be the be-all and end-all of science; its goal must be to explain phenomena. There are phenomena whose origin and existence are difficult to fathom, and for which one will not immediately seek laws. There is no chance. But not everything can be brought to light by an algebraic formula. Much can still be brought to light, but until then, it will be ignorable for tens of

thousands of years. The speaker then highlights what the historical sciences owe to classical philology and how historical research developed within its school. Textual

- criticism has proven exceptionally useful in this regard. The antiquities of the ancient philologists were already a history of civilization. Modern historical study is rooted in the study of ancient history. But later studies, especially archival
- 79710 studies, repay the services rendered with usury. Among the leading sciences is the study of antiquity, archaeology. Although one must also guard against one-sidedness in this field, it has managed to develop into a model of an exact historical science in the last thirty years, especially in the
- 79715 initial investigation of the facts, through excavations, knowledge of ancient coins, and the style of ancient works of art, using all sorts of tools. This puts research on solid ground. Archaeology has breathed new life into the entire study of classical antiquity. Inscriptions have proven excellent services in this regard. These, in turn, are explained by knowledge of customs and traditions. Through archaeology, numerous peoples have risen before us, as if from the dead. From the fragments of
- 79720 ancient civilization, a world history is gradually emerging for us, as it were. Because life is gradually coming into everything, we ourselves are living along with it, the harmony around us creates harmony within us. The historical sciences are, at their core, an anthropology. The human is the object of our interest. And that human reveals itself in various domains, which is why people can find material for their
- 79725 spiritual needs in very different areas. Historical science, therefore, stands alongside the study of nature and also derives significance from the pressure of temporal circumstances; the prophets of Israel, the artists of Greece, the jurists of Rome do not belong to a worn-out geological
- 79730 formation for us; they live for us. Moreover, no theory of natural science can be elevated to a general world philosophy. Let us recognize that the spiritual life of man cannot be understood without the help of our historical sciences. In this regard, we should beware of a vulgar rationalism, which we bow to as if it were a new revelation of 19th-century natural science. And then the Rev. warns: Finally, against the rationalist leaven in another respect.
- 79735 Practical utility is not so glorified. It is all utility. But that is not the answer to the question: why science? Rather, it is this: to obey a powerful driving force within us, and the realization that we are in harmony with it satisfies us. Should the numbness of utilitarianism ever affect our civilization, it will revive when it reads of Hellas, what it means to practice art and science for its own sake.
- 79740 With the usual addresses to curators, professors, and students, the speaker concludes his speech.
- 79745 July 7, 1898 At the Kon. Decision: Professor J. van Leeuwen Jr., Professor of Arts and Philosophy at Leiden State University, is relieved from teaching Greek antiquities, and Professor A. E. J. Holwerda, Professor of Arts and Philosophy at that university, is now charged with teaching Greek antiquities.
- March 4, 1899 Married:
Dr. A. E. J. HOLWERDA, Professor at Leiden, Widower of Mrs. N. JONKHEID,
79750 and
C. L. A. JONGKINDT CONINCK, Widow of the Honourable Mr. D. LA GRAPPE DOMINICUS.
Leiden, March 2, 1899 [Married on March 16, 1899.]
- 79755 March 7, 1899 The Board of the Philological Study Fund, established in Utrecht, invites, since the beginning of the last preceding academic year, PhDs or PhD candidates, currently studying or having studied at a Dutch university, who wish to be considered for a posting to Rome, Athens, or another location to be designated by the Board, under the condition of receiving a stipend of an amount to be determined later, to apply to the delegate of their university before April 1. The delegates
- 79760 are: Professor HOLWERDA for Leiden; Professor VALETON for Amsterdam; Professor BOISSEVAIN for Groningen; Professor v. d. VLIET for Utrecht.
Art. Article 16 of the Articles of Association: "Dutch nationals who are or have been students at one of the State universities or the Municipal University of Amsterdam may be sent."
- 79765 "Firstly, Doctors or Doctoral candidates in classical literature are eligible, subsequently also Doctors or Doctoral candidates practicing the subjects mentioned in Article 42, paragraph 5(d) and Article 45, paragraph 5(e) of the Higher Education Act."
- 79770 J. V. D. VLIET, Secretary of the Philological Studies Fund.
- Regarding a lecture at the Teylers Foundation in Haarlem, February 14, 1900, see <http://nha.courant.nu/issue/HA/1900-02-17/edition/0/page/1?query=holwerda>

- 79775 April 17, 1900 [...] the continued meeting of the Historical Society and Archaeology. Dr. J. Berlage from Gorkum spoke on: "A Roman castle in Germania," while Dr. J. H. Holwerda Jr. from Leiden spoke on: "Delphi." Both clarified and illustrated their informative and engaging presentation with drawings and maps.
- 79780 January 4, 1901 The January issue of Tijdspiegel contains: Dr. J. H. Holwerda Jr., Delphi;
- 79785 December 14, 1901 To Prof. Dr. A.E.J. Holwerda.
Your Honorable Sir,
Following your letter in the "Algemeen Handelsblad" dated December 7, I consider it advisable to address just a few more words to you. It seems to me that a further exchange of ideas between you and me about the purpose of museums in general is completely pointless. Our opinions on this matter diverge too much. I also consider a further explanation of my opinion superfluous, since the organization of most museums is already moving in the direction outlined in my letter of November 30th. In almost
- 79790 all natural history museums, the collections are already divided into two sections: one for the general public ("Show Collection" or "Schau-Sammlung") and a second for scientists.
- 79795 The administrators of ethnographic museums also already follow this principle. At least, the director of the National Ethnographic Museum writes in his compelling work: (Dr. Schmeltz, "Ethnographic Museums in Central Europe". Report of a Study Trip. Leiden, E.J. Brill. 1896), speaking about the "Anthropological-Ethnographic Abtheilung des K.K. Naturhistorischen Hofmuseums" (Anthropological-Ethnographic Abtheilung of the Royal National Natural History Museum) in Vienna (l. c. p. 52):
- 79800 "The board has established a separation between objects suitable for public display and those of more special interest to the professional. This measure, which has long been in use in Museums of Natural History, but, as far as I know, here for the first time in an Ethnographic Museum, is certainly worthy of imitation." (I add space.)
- 79805 With a view to the future of the National Ethnographic Museum, I indeed attach great value to this statement by Dr. Schmeltz. Once the division of collections, in the aforementioned spirit, has been accepted in principle by professionals and museum administrators, the choice of the location for the large public national museums—both in the government and parliament—can no longer raise any objections. The one is logically connected to the other; public national museums with "schau Sammlungen" (show collections) for the public should naturally be located in the largest
- 79810 population centers.
- But now for the reason why I consider it advisable to answer you.
In the November issue of "Onze Eeuw" 190, p. 1013, you wrote that we have "cleared out" our ethnographic collection at Artis. In my "Open Letter" to you in "Algemeen Handelsblad" dated November 30th, last year, I emphatically protested this false
- 79815 representation and even attempted to assure you that our Ethnographic Museum is flourishing—thanks to the many interesting and valuable acquisitions. (Ethnographic collection of the Siboga expedition, etc.) Wherever there is talk of "acquisitions," of "enrichment," the concept of "clearance" is already excluded.
- 79820 A further correction on your part would certainly not have been out of place. But see—in your letter, addressed to me in the "Algemeen Handelsblad," I now read the following: "That the Ethnographic collection at Artis was not literally cleared out is entirely correct. Oh no, it has simply been left without its own curator for years, without a professional to manage and organize it. It has been, so to speak,
- 79825 linked to... the Entomological Museum at Artis; an entomologist who is also curator of ethnology."
- What now? — is this serious or short-tempered?
- The replacement of the curator-ethnographer, Mr. C. M. Pleijte Wzn., by the curator-zoologist Dr. J. C. H. de Meijere, is surely not a "clearing-out process."
- 79830 You further say: "I do not believe that the study of insects is the right preparation for those in religion, art, and the art industry." — I do not either, — but equally I do not believe that the study of religions or ancient languages is the right training for those in agriculture and livestock farming, hunting and fishing, costumes and
- 79835 apparel, house construction, vessels, instruments, weapons—in short, all those things and objects that play a much larger role in the lives of so-called "uncivilized" peoples and therefore primarily fill our Ethnographic Museums. So when the skilled ethnographer, Mr. C. M. Pleijte Wzn., left our Museum, we faced a difficult situation. There were plenty of applicants—officers, civil servants, ministers, etc.—

but no "professionals." After careful consideration, the board appointed Dr. J. C. H. de Meijere as curator—not exclusively an "entomologist," as you might think—for nowhere in this country, and as far as I know nowhere else, can one obtain training solely as an "entomologist"—but as a zoologist in general, a student of Professors Dr. Max Weber, Dr. C. A. J. A. Oudemans, and Dr. Hugo de Vries.

Why a zoologist now? Because a zoologist, through the nature of his morphological and comparative studies, has learned to describe the most diverse, largest, as well as microscopic, objects, and through his strict classificatory training, through which he is, as it were, drilled in the art of ordering and arranging, generally feels more at home in a museum than a man of letters or a theologian.

We remain convinced of the correctness of this view—especially where we experience that it is supported by very compelling facts. Although I am, of course, far from capable of tracing the genesis of all ethnographers, it is nevertheless noteworthy that several renowned ethnographers—in relation to their training—are "zoologists." Apart from the fact that Prof. Dr. Max Weber also published ethnographic studies ("Ethnographische Notizen über Flores und Celebes", 1890), the well-known ethnographer Dr. A. B. Meijer, director of the "K. Zoologic Ethnographic-Anthropological Museum" in Dresden, — a zoologist; A. C. Haddon in Cambridge was formerly a professor of zoology in Dublin; Prof. Dr. E. H. Giglioli, a permanent staff member of the "Internationales Archiv für Ethnographie" — published in Leiden — is a professor of zoology in Florence; and Dr. J. D. E. Schmeltz, — director of the National Ethnographic Museum in Leiden and editor of the aforementioned journal — formerly conducted scientific research in the field of zoology. (J. D. E. Schmeltz "Ueber Polynesische Lepidopteren etc.")

The view of the board of our Society regarding the appointment of a "zoologist" as curator at the Ethnographic Museum — was therefore not founded on such shaky ground, but was indeed well-founded.

I am pleased that your letter has given me the opportunity to share this view of the board of I was able to publicly explain our Society.

I now have the honor, with the highest respect, Your Honor,
Your Servant,

Dr. C. KERBERT,
Director of the Royal Zoological Society "Natura Artis Magistra".

August 30, 1922, PROF. HOLWERDA. †

Yesterday, at the age of 77, after an illness lasting only three days, Professor A. E. J. Holwerda, former director of the National Museum of Antiquities in Leiden, passed away in Leiden.

Prof. Dr. Holwerda was born in Gorcum on July 21, 1845, and after successfully completing the state examination, enrolled as a theology student at Utrecht University on September 21, 1862. He soon began studying in literature and received his doctorate in ancient literature in Utrecht on May 1, 1868, under the rectorship of Professor N. Beets and with Professor Herwerden as his supervisor. From 1869 to 1870, he was a lecturer at the H.B.S. in Schiedam and from 1878 to 1886 at the H.B.S. in Leiden.

The latter year, he was appointed professor at Leiden University to teach archaeology and ancient history. He accepted this position on April 29 of that year with an inaugural lecture on the historical sciences, in particular classical antiquity, their independence and significance.

In 1905, he was appointed director of the National Museum of Antiquities in Leiden, succeeding Dr. Pleyte. In 1915, he resigned as professor upon reaching the age of 70. Numerous works are by him. Published works include "Die alten Kyprier in Kunst und Kultur" (1885), "The Significance of Archaeology for the Study of Antiquity," a speech delivered on the occasion of the Second Dutch Philologists' Congress on April 18, 1900, in Leiden.

During the struggle over higher education under the Kuyper ministry, he published the brochure "Special Universities and Special Professors" in 1903, in which he championed the cause of the special universities.

That same year, he published a brochure on the reform of our grammar school and secondary education, reprinted from the publications of the Association for the Simplification of Examinations and Education. In response to the criticism that followed, his brochure on the special universities was followed in 1905 by a brochure: "Who are we ourselves? A word to his fellow intellectuals," also in response to the educational novella, and secondly: "Can we not become different? A word to his liberal compatriots."

He also wrote several articles. in the Gids, the Spectator, Mnemosyne, Die

79905 Archeologische Zeitung, and the annual journal of the Kaiserlichen Deutschen
Archeologischen Instituts.
In 1893, he was appointed a member of the Royal Academy of Sciences in Amsterdam,
where he gave a paper in 1905 on: "New Portrait of Emperor Augustus."
The deceased was also a member of the Society of Dutch Literature and a Knight in the
79910 Order of the Netherlands Lion.
So much for the official announcements.
We briefly considered under which heading we should file this death, under Education
or Art. We chose Art because we had so often observed Professor Holwerda's work on
ancient art, both from afar and up close.
79915 We knew the professor personally for four years and often conversed with this
amiable, jovial, and always friendly-smiling old gentleman. Hearing him talk about
ancient art, excavations, etc., was a delight. How indignant the otherwise jovial and
amiable old man could become when he heard about vandalism in the field of ancient
arts. I once heard him speak with indignation about the demolition of an old pump in
79920 one of our Limburg villages. But it was even more interesting to see the professor at
work in his museum. Unlike other museums in Leiden, Professor Holwerda's was
distinguished by order and regularity. Everything had its p
I've never seen his kind, big eyes sparkle more than when I made a remark he hadn't
suspected: "Do you know, Professor, that Baedeke placed a star for your museum, and
79925 nothing for the other Leiden museums?"
The Leiden museum was his glory. His absent-mindedness was also proverbial. A "joke"
is told about him, which he himself never confirmed, but why those kind, faithful
eyes laughed so often. The professor wanted to visit a colleague but didn't know the
correct house number. He rang the doorbell at number 33 and asked the lady who opened
79930 the door: "Am I with Professor..." No, was the answer, then you should go next door.
He rang the doorbell at "next door" and asked: "Am I with Professor..." When the maid
started laughing and corrected him: "You're with Professor...", Mr. Holwerda realized
he had become the victim of his absent-mindedness. With Mr. Holwerda, one of our most
eminent Dutch scholars descends to the grave.
79935 May his memory be cherished.
OWL.

September 2, 1922 Funeral of Dr. Holwerda.
Amidst many expressions of interest, primarily from scholarly circles in Leiden and
79940 beyond, the burial of the remains of Prof. Dr. A. E. J. Holwerda, former professor at
Leiden University and former director of the Museum of Antiquities, took place
yesterday morning at the cemetery on Groenesteeg in Leiden. Representatives included
the University's Board of Governors, the Senate, and the board of the Faculty of Arts
and Philosophy. In accordance with the deceased's expressed wishes, no speeches were
79945 held at the graveside. After flowers were strewn on the grave, the son thanked Dr. J.
H. Holwerda for the last honors paid to his esteemed father.

van Giffen versus Holwerda jr

79950 [p. 153] IV. DATING AND HISTORY. (fig. 110).

Thus, a Roman castellum, also a naval station, lay here on the present-day Vliet near
Voorburg; the harbor bed, which was rediscovered here in connection with the Vliet,
and the tiles with stamps from the Roman fleet unearthed here, exclude all doubt. I
79955 have often emphasized how the presence of this naval station is one of the strongest
pieces of evidence for the old belief that the Vliet must have been the old
Corbulonis canal, dug around the middle of the 1st century AD. In his essay on the
Fossa Corbulonis, Mr. BEEKMAN (Tijdschrift v. h. Kon. Ned. Aarde. Gen. 1916) last
elaborated on this belief in detail. It seems to me that doubting its correctness is
79960 now virtually impossible. This canal of Corbulo was dug, as Tacitus tells us, "ut
incerta maris vitarentur," that is, to avoid the uncertain sea, so as to be able to
sail as much as possible inland; there seems no doubt as to where.
"There are four places from which one usually crosses to Britain from the mainland:
from the mouths of the Rhine, the Seine, the Loire, and the Garonne. But those who
79965 choose the sea from the Rhine region do not depart from the mouths themselves, but
from the Morini, who live among the Menapii" (that this means the mouth of the
Scheldt is beyond doubt). Thus, STRABO IV, 5, 2, tells us. Here we clearly see the
purpose of both the digging of Corbulo's canal and the construction of our fortress.
Both are clearly aimed at the military communication of the Rhine with England. We
79970 find confirmation of this in many pieces of pottery, which are not of Rhine origin,

but are closely related to forms used specifically in England (cf. in particular II, A 3 and various types under II D). These demonstrate at least a very close connection between our Arentsburg and Roman England in those days.

Regarding the time at which our naval station existed here on this canal, our finds do not leave us in any doubt about that either. From our surveys of the terra sigillata and other pottery, it is clear that this astonishingly rich ceramic material, with a few early exceptions, only begins with the somewhat later Flavian period. Early Frankish pieces, such as the well-known sigillata forms Drag. 29, are not yet found, or are very rare. The coins also speak of the same starting time.

Indeed, Vespasian is the first emperor for whom a large number of coins have been found, and with whom the continuous series of coins begins. Considering that such coins were still in use for some time after their creation, this material also points to a beginning under the same emperor or his successor.

Perhaps even more eloquent are the finds of tile stamps. The first large number in our time are the stamps of Legio X, which, as is well known, first arrived in our country with the Batavian Revolt of 70 and departed again around 105. It was this legion that we rediscovered in Nijmegen on the Hunerberg, and which therefore apparently sent a detachment to this castellum. Our legion stamps, however, allow us an even more precise dating. They seem to prove that the castellum was built before the year 89. Indeed, we read here only the few names of the legion: "X Gemina"; the addition "pia fidelis Domitiana," which it received in the year 89 as a reward for its loyalty during the rebellion of Saturninus, and of which it has retained at least the first two predicates, "p. f.," appears only on one tegula (cf. RITTERLING "de legione X Gemina" and Westdeutsche Zeitschr. XII 20).

Now we hear that it was precisely during these years that the Romans conquered Britain, and that military transports from our region also played a role in this (cf. TACITUS's account of Agricola's expedition, 36). Cohorts of Batavians and Tungri even saved the day for him at one point in the year 84. This considerable force, originating from the banks of our Rhine, must therefore have crossed from here to Britain, and it is therefore logical to assume, after the above, that our naval port of Arentsburg was built for these British expeditions, in which our country also had to play such an active role a good ten years after the Batavian Rebellion.

Yet another fact confirms this. Wherever it was possible to distinguish the oldest construction period of the fortress from the others, it turned out that Batavian pottery (and Tungrian pottery is probably indistinguishable from it) was in common use among the first builders of our fortress.

Already at the beginning of this work, I expressed the opinion that it must have been Batavian cohorts who built our fortress. Now, I think we can safely say that the Batavian cohorts, who performed such important military operations in Britain in 84, probably built their staging port here.

As both coins and, especially, pottery series demonstrate, this staging port served continuously for the military connection of the Rhine with Britain until shortly before the middle of the 3rd century. That it would have been needed occasionally for larger military transports during that period is also evident from written tradition.

According to SPARTIANUS (Vita Hadriani) and FRONTO ("de bello Parthico"), fierce wars must have been waged in Britain during the time when Emperor Hadrian came to power. We know very little about this. We only know of one inscription (cf. Riese Inscr. no. 499) concerning a person who held various posts under Emperor Hadrian, and before that time, "tribunus militum" was "legionis VI victricis cum qua ex Germania in Brittanniam" (translated). So, we have here the transport of an entire legion from Germany to Britain at the beginning of Hadrian's reign, when there was such fierce fighting in that country, and it is obvious that our staging port also served in this context.

However little else we know about British history, we are still frequently mentioned of Batavian and other auxiliary troops from Germany. An exceptionally heavy period of fighting in Britain begins again in the time of ANTONINUS PIUS, whose wall in Scotland testifies to an extensive conquest (cf. MACDONALD, The Roman Wall in Scotland). "Antoninus Pius per legatos plurima bella gessit; nam et Brittones per Lollium Urbicum vicit legatum, alio muro summotis barbaris ductor," it says in the

"vita A. Pii" (5, 4). Established by inscriptions in the Pius wall in the north, the name LOLLIUS URBICUS even appears in these inscriptions (C. I. L. VII 1083-1141, especially 1125). Fighting also took place against the Brigantes south of the Antoninus wall. The name of JULIUS VERUS, whose many inscriptions have been found in this part of England (cf. HAVERFELD, "Julius Verus"), is associated with this battle.

According to the inscriptions, this action can be dated to the year 158. Of particular importance to us is an inscription, quoted by MACDONALD 1.1., p. 9, which

mentions units of the 2nd, 6th, and 20th legions, which were detached from both Germania under Julius Verus to Britain for assistance in the battle. We can imagine how our staging port at the Rhine estuary must have been put into action in that year, as troops from Germania apparently rushed to Britain from all sides to assist Britain.

It seems highly likely to me that we are seeing here the events that also left their mark on our remains of Arentsburg. After all, it seems highly likely that repairs and new construction would have been necessary for that large troop transport in the staging port as well. And precisely at this time, shortly after the middle of the 2nd century, we observed new construction at various points within the fortress. For example, the large double gate, built into the long western side wall, dates from this period. The new partition between the harbor and the fortress, which is connected to this gate, also dates from this period. At various points in the barracks, both those of the infantry and the cavalry, we observed repairs around this time.

Such a second construction period is also likely to be discernible in the stone buildings excavated by REUVENS. At least the stamped tiles also speak of significant construction in the second century, although the exact age cannot be determined. First, we must note that, in contrast to the later building materials, the bricks found here from the 10th Legion—that is, those from the early period of the fortress's construction—are exclusively roof tiles. Building materials from foundations or hypocausts are not present here from this legion. It therefore seems likely to me that during this first construction period, at the end of the first century, even the main buildings were constructed exclusively of clay, roofed only with stone tiles.

The oldest hypocaust tiles, therefore, are from legion eleven, those of legion 1 Min and legion XXX Ulpia Victrix. Dating these stamps as precisely as that of legion X is not possible. We do know, however, that both legions arrived in Lower Germany shortly before 120 and that the first remained in these regions until the time of M. AURELIUS, the second until the very last. (Cf. SCHILLING "de leg. Rom. XXX Ulpia", see also Bonn Jahrb. 111/112, 296).

These tiles and stones, which REUVENS found used primarily in his buildings I and III (villa and praetorium), can therefore probably also be attributed to the new construction period, around the year 158, which we assumed above. It seems likely to me, therefore, that the large main buildings were first erected as actual stone buildings at that time.

Thus, we see a very extensive reconstruction of our fortress around that time; the large gate, probably the main buildings, and certainly several barracks were renovated at that time, and it is obvious, as we have already seen, to look for the cause in the extensive transport of troops from three legions, which must have taken place from the Rhine to Britain.

However, based on our tiles, it seems possible to speak of a third construction period for our fortress. By far the largest mass of this is namely, those with the stamps of the Exercitus Germ. inferioris or its Vexillationes. Now we know (cf. Bonn Jahrbuch 111/112, 296) that this stamp was common in the tile factories, which produced the building materials for both Legio 1 and Legio 30, probably somewhere in our country itself, at the end of the 2nd and the beginning of the 3rd century. These stamps cannot be dated precisely, but they generally belong to this late period; the fact that they are the last is, of course, also attributable to the preponderance of their number. And now, it seems highly likely to me that this staging port was also used extensively under Emperor Septimius Severus. After all, even in the latter part of the 2nd century, the period from which finds at Arentsburg are also very abundant, there were continuous wars in England. (Vita M. Aur. in the Hist. Aug. VIII, 7). In 175, we again hear of troop transports from the Danube to England (Dio. XXI, 16), and it seems not unlikely that these took place along the Rhine and through our port. Furthermore, there is constant talk of fighting in northern England over the rampart that Antoninus Pius had built in Scotland (Dio. XXI 8, XXII 9). These wars were particularly fierce under Septimius Severus and even seem to have ended with this emperor withdrawing from northern Britain and building a new stone defensive wall on the site of Trajan's former rampart (cf. Dio. XXVI 12 and 5 Vita Severi, Hist. Aug. 18, 2. See Bonn Jahrb. C X, p. 30).

In this context, another matter seems remarkable to me. We saw above that REUVENS had already been on the section of land that we who may now attribute to the harbor, has excavated one or more stone buildings (II), in which one would naturally prefer to see buildings intended for the fleet, factories or arsenals; REUVENS also points out

the probability that they date from a relatively late period. Now I have previously expressed my opinion about some inscription stones, now preserved at Duivenvoorde Castle in Voorschoten, which earlier writers seem to have found now here, then there. I suspected that they probably originated from the only Roman ruin we know of in South Holland, from Arentsburg (cf. Ber. d. R. G. Komm. IV 8 and CIL XIII suppl.). These inscriptions all belong to the time of SEPTIMIUS SEVERUS and his successors and one of them reads: (Riese Inscr. 171): "Imp. Caes. L. Septimius Severus Aug. bet M. Aurelius Antoninus Caes. Coh. XV Vol. armamentarium vetustate collabsum restituerunt sub Val. Pudental leg. Aug. pr. pr. Curante Caecil. "Batone praefecto." Could there be a connection between these relatively late harbor buildings and the arsenal rebuilt by Septimius Severus? If so, then we also have a construction activity in Arentsburg at a time when this harbor would have served a significant purpose as a staging post to England.

Tradition is entirely silent about the subsequent historical periods. We know nothing of these regions or of England. Therefore, we are entirely dependent on the finds for the final period of Arentsburg's existence.

To determine the period until which the fortress existed, the finds are also entirely sufficient. The last types of decorated relief terra sigillata, from the beginning of the 3rd century, certainly still occur at Arentsburg. However, they are no longer as numerous as those that immediately precede them. Likewise, we find quite a bit of other pottery from the first third of that century, although the first 30 to 40 years of the 3rd century are... Arentsburg was still occupied in the 1st century, although not as densely as in the 2nd century. After that, however, the pottery suddenly breaks down. Of the utmost importance for our dating is the fact that the last types of pottery, which we find, for example, in Niederbieber,

The finds, which were after all abandoned around the year 260 (cf. OELMANN Keramik Niederbieber), do not occur here, or only very rarely. It is therefore certain that Arentsburg was abandoned several decades earlier than Niederbieber.

The coin finds also fully agree with this. Up to and including CARACALLA, we see our unbroken series continue regularly, with a nearly even number of coins. Then, the coins from the years in which the pottery only indicated a small occupation begin to become rarer, and with GORDIANUS (238), the continuous series finally breaks off completely. We would certainly not be far off if we consider this year to be the end date of the actual fortification.

Only a very few pottery pieces can be from a slightly later period; there are no compelling data in this regard. However, our coin series does possibly point to a revival, albeit insignificant, around the year 270. We saw above how, according to REUVENS's data, a single cavalry barracks (REUVENS's building IV) was built of stone at one location in our fortress, which was apparently already largely in ruins at that time. This was in contrast to all other barracks buildings from an earlier period, partly using fragments from this rubble. It seems likely to me that we must combine these phenomena and assume that the walls of the already dilapidated fortress once again served as a temporary residence for a Roman cavalry troop around the year 270. The single coin of Emperor CONSTANTINUS is, of course, in itself insignificant. Undoubtedly, under this emperor, our naval fortress in the Germanic lands had long since fallen for good.

However, before this fortress was built at this location, as we have seen, another structure was located here. Even before our excavations began, I had suspected the presence of such a precursor. The single pot from the 16th legion, which was permanently disbanded in the year 70, which prompted this suspicion, has remained such an isolated phenomenon that I dare not now attribute any dating significance to it.

The many traces of soil found beneath our fortress itself, however, leave no doubt about the existence of such a prehistoric period. It was not an actual fortress that stood here at the time; it was probably merely a building surrounded by palisades. We cannot date this building because here, even more so than in the first fortress period, the pottery, which cannot be dated so precisely, predominates. Meanwhile, it seems undeniable that a number of very early pieces among our finds—a few coins, a piece of millefori glass, and pottery fragments sufficiently indicated in the descriptive list—can be attributed to this oldest period. Although their number is too small to allow for any dating with certainty, because with such a small number of specimens one always has to reckon with the possible coincidental survival of a few specific objects, we can nevertheless assume with great probability that the first settlement here already existed in the early years of our era, if not a few years earlier. In any case, it is certain that a Roman settlement must have existed here

80170 well before the Batavian Revolt; the traces of the foundations alone teach us this with complete certainty.
Now a few words about the name. We have previously explained why we believed we might have the Praetorium Agrippinae of the Peutinger map before us (cf. fig. 110). After all, this map depicts two significant places close together in the center of South Holland between the Meuse and the Rhine: Lugdunum Batavorum and, just a few miles inland, Praetorium Agrippinae. It seems impossible to derive any information from the map's drawing or measurements; they are too unreliable. However, when we consider how our Voorburg ruin lies on the extreme eastern edge of the sand of the Dutch coastal region, and that settlements are known in several places to the west, under the dunes, it seems highly likely that we are looking for the eastern of these two places here, near Voorburg, and that Lugdunum must lie somewhere under the Dutch dunes. It also seems significant to me that the small drawing indicating Praetorium Agrippinae on that map—a small square building with a blue box in the center—is the same as what we often encounter on that map for places located on water. This, too, might argue in favor of identifying this Praetorium with our naval port. However, certainty regarding the name is impossible; the expectation that the excavations might reveal it has not been fulfilled. I used to think that Claudius' wife...

80185 Agrippina might have been the namesake here, but the considerable number of objects from an even earlier period found here might now perhaps remind us more of the ancient Agrippina.
80190 One thing is certain in this regard: our fortress is not what people used to believe: the Forum Hadriani of the Peutinger map. After all, firstly, it was not a forum but a naval port, and secondly, it existed long before Emperor Hadrian could have given it his name.

80195 See also <https://www.delpher.nl/nl/tijdschriften/view?identifier=MMKB07%3A000885001%3A00121&query=arentsburg+vlootstation&coll=dts&sortfield=date&page=2>

80200 Conclusion. The Roman fortification at Arentsburg was simply a fortified station of the Rhine fleet and had no other significance than the other stations of the Classis Germanica along the Rhine.

THE SIGNIFICANCE OF THE CASTELLUM AT ARENTSBURG

BY F. KROON

Based on the numerous and important discoveries at the site, Dr. Holwerda, in his publication "Arentsburg" 1), has established a very close connection between the castellum at Voorburg and events in Britain. He believes he recognizes the great significance of the Rhine for Roman war policy towards Britain and, as it were, relates the history of the castellum to events in that country. The presence of ceramics of likely British origin supports his view. A careful study of this matter, however, has led me to a completely different insight and to a differing view regarding the military significance of the aforementioned castellum with its naval station. To explain this view, it is first necessary to briefly outline how Dr. Holwerda classifies and dates the finds:
a. He concludes that the reconstruction in stone of an older settlement and the construction of the naval station took place before the year 89. In another writing, 2) he specifies this further by indicating around 85, the oldest shards being from the time of Domitian.
b. Furthermore, he notes significant new structures at various points in the castellum, which he places shortly after the middle of the 2nd century.
c. He then considers the possibility of a renovation.
80225 1) Arentsburg, a Roman military naval station near Voorburg (1923).
2) The Netherlands' earliest history (second edition, 1925).to be recognized around the end of the 2nd century or the beginning of the 3rd century.
d. He then raises the possibility of the construction of arsenals around 210.
e. From the finds, he further concludes that the castellum was abandoned around 238, but was temporarily occupied again around 270.
80230 f. A fairly large quantity of ceramics, probably of British origin, finally serves to point out the connection with Britain.
To highlight my objections to Dr. Holwerda's very close connection between the history of the castellum and that of Britain, it is necessary to address the

80235 aforementioned cases one by one:
ad a. Dr. Holwerda connects the reconstruction in stone and the construction of the harbor with Agricola's campaigns in Britain and, in his view, with the changed Roman war policy towards that country during those years. As we have seen, the oldest Roman shards date from the time of Domitian, who came to power in 81. Dr. Holwerda now
80240 dates the period to around 85. If desired, one could place it even earlier, but in my opinion, not before 82. Let us therefore stick with this year and consider the events in Britain.

Since the revolt of Boudicea, four legions had been stationed there. In 67, Nero was able to remove one of them (Leg. XIV), thus reducing the occupying army to three
80245 legions again. In 71, however, another period of aggression began when Cerealis, after suppressing the Batavian revolt, invaded with Leg. II Adiutrix departed for that city. After three years of successful operations, Cerealis was replaced in 74 by Frontinus, who vigorously continued the conquest. When his term of office expired, he was succeeded in 77 by Agricola. He undertook a campaign every year, which led him
80250 further and further north, until in the late summer of 82 he decisively defeated the Caledonians, the northernmost tribes. The conquest of all of Britain seemed to have been accomplished. However, it was Agricola's last campaign; he was recalled in 83. Now, while the image given by Tacitus may be highly exaggerated and highly
80255 subjective, one can certainly assume that Domitian, for whatever reasons, no longer cared for Britain, and that Agricola had to watch with great regret that his magnificent work was not consolidated and what he achieved was jeopardized by the failure to fully pacify Caledonia 2).

In any case, it is certain that after 83, there was no further military action in Britain for a considerable time. On the contrary, around 86, Legion II Adiutrix was
80260 sent to the Danube, reducing the occupying army to three legions. Can we now connect the reconstruction in stone of our castellum at Arentsburg—as we saw, at the earliest in 82—so closely with an action in Britain that had been underway for years, but ended precisely in that year? It seems truly irresponsible to me.

And if one were to speak, with Dr. Holwerda, of a change in Roman war policy towards Britain, then this would have to be in the opposite sense to what he does. Indeed, Domitian turned away from Britain and turned against Germany. For however much this emperor was slandered and ridiculed by ill-disposed authors for his victories over the Germans, the spade ultimately did him justice. 3) His work on the Rhine and
80270 Danube was of great significance. If, as I believe necessary, one excludes the events in Britain, then there are two possibilities for the reconstruction in stone and the construction (possibly renovation) of the port: either they were connected to other military measures, or they were incidental. It seems to me that the events on the Rhine in the first years
80275 of Domitian's reign compel the former view. After all, in 83 the campaign against the Chatti took place, which ended with their subjugation and the occupation of their territory. After this, construction of the first Limes began.

1) Agricola.
80280 2) Collingwood and Myzes, *Roman Britain and the English Settlements* (Oxford, 1936), pages 113 et seq.
3) F. Koepp, *Die Römer in Deutschland* (1926), pages 52 et seq.

Isn't it much more natural to understand the innovations at Arentsburg in the context of those events than to look for a connection, as has been demonstrated, that is very difficult to accept with an action in Britain that was drawing to a close?
80285 It is quite possible that the improvement of the castellum was deemed necessary to deter the Batavians and Caninefates, many of whom had witnessed the uprising in 69, from rash actions during the action against the related Chatti. Aside from this, it
80290 is clear that this action necessitated numerous transports on the Rhine. Securing these transports and generally strengthened military-police surveillance of the waterways must naturally have required greater activity and probably also an expansion of the Rhine fleet. The construction (possibly improvement) of the harbor section is perfectly logical in this context. It is in the nature of things that the
80295 castellum was also renovated and strengthened at that time. If one considers the year 83 too early, then there is also the construction of the Limes and the very dangerous uprising under Ant. Saturninus in 88. No, truly, enough happened on the Rhine itself in those years to explain the improvements at Arentsburg. and. Dr. Holwerda could not define the dating of the following, very important, new constructions as precisely as the previous one. Nevertheless, he believes he can ultimately place it at around 158.
80300 In this, he is actually guided entirely by his assumed close connection with Britain.

Which, however, as we saw above, must be considered highly dubious at the very least. This dating is based on the discovery of hypocaustic tiles bearing the stamps of Legion Minervia and Legion XXX Ulpia Victrix, which tiles primarily belonged to two

large buildings, designated by Dr. Holwerda as a villa and a praetorium. The former legion arrived on the lower Rhine around the year 83, proceeded to the Danube around 100, and returned to its camp in Bonn around 105. In 162, it took part in the campaign against the Dacians, but also returned to its old garrison afterward, where it remained. Regarding the time, the tiles of this legion could therefore date as early as 83, and certainly from 105, when Legion X Gemina, which also had a detachment in Voorburg, permanently departed these countries, and a detachment of Legion I Minervia was likely stationed there. However, we must assume, on the authority of Dr. Holwerda, that the buildings date from a later period.

Leg. XXX Ulpia Victrix arrived on the lower Rhine around the year 119 and remained there until the end of the Roman occupation. The tiles of this legion can therefore be dated from around 120. If we now assume that the new building was intended for detachments of both legions together, we arrive at a possible period from 120 until the date when the Exc. German Inf. stamps were jointly introduced for both legions. This date is not known with precision, but it likely falls in the early second half of the 2nd century. There is therefore a time lag of approximately 40 years.

In addition to the large buildings mentioned above, the following have also been observed: a new, heavy gatehouse in the western wall, a new partition between the fortress and harbor sections, and various renovations to some barracks buildings. Further developing his hypothesis that the origin and subsequent history of the stone castellum with naval station is closely linked to the course of events in Britain and in connection with the well-established fact that fierce fighting took place there during the reign of Antoninus Pius, necessitating the sending of reinforcements from the Rhine overseas, Dr. Holwerda suggests that these buildings also reflect the history of Britain and were connected to those transports.

As a former officer, I find this somewhat unsatisfactory. Even if one were to assume that those transports passed through Arensburg (which is possible, but not certain) and stayed there for a few days to stretch their legs before the start of the sea voyage, one would still expect the construction of a number of temporary barracks rather than palaces with central heating and luxurious bathing facilities. The large gatehouse and the new partition between the fortress and harbor sections are also difficult to explain in this context. The only things that, in my opinion, could fit this picture are the improvements to the existing barracks, if they also represented expansions. But as far as those other buildings are concerned, I really cannot find any basis for it. The praetorium and the villa, in particular, point more to the imminent arrival of a great lord than to passing troops. If one now asks what great lord could be expected after 120, one immediately thinks of Hadrian, who, after inspecting the Rhine border in 121, crossed over to Britain.

One can't help but wonder whether the castellum at Arensburg should be identified with Forum Hadriani of the Tabula Peutingeriana. Dr. Holwerda believes that this is not the case. After all, he says, firstly, it was not a forum (in the sense of marketplace, he means) but a naval port, and secondly, it existed long before Emperor Hadrian could have given it his name.

It should be noted, however, that forum does not exclusively mean marketplace. In my opinion, it is quite possible that Hadrian used his stay there to personally settle various pending matters; this was entirely in his nature. In commemoration of this important event, the castellum may have been renamed.

Returning to the core of our topic, it should be noted that it is known how Hadrian personally gave instructions on his travels for improvements to the fortifications, sometimes even ordering their relocation. There would therefore be a strong case to be made for attributing the other renovations to his efforts. This seems quite acceptable to me for the renovations to various barracks and the new partition between the fortress and harbor sections, but an exception must be made for the large gate.

Dr. Holwerda reports that for the construction of this gate, the existing moat had to be partially filled in, and that shards were found in the material used, which makes it necessary to date the gate's construction to at least around 160. But in Dr. I have found nothing in Holwerda's publications that would necessitate placing these other buildings in the same period, as he does.

It therefore seems advisable to me to divide the buildings, which Dr. Holwerda places in one group around 158, as follows:

- a. The palace and the villa: shortly before Hadrian's arrival, i.e., 120-121.
- b. The improvements to the barracks and the partition between the fortress and harbor sections: after his departure, i.e., 121-122.
- c. The large gate in the Western Wall: ± 160.

Regarding this gate, it should be noted that its connection to events in Britain also seems highly dubious to me. While there was fierce fighting there during Antoninus Pius, and undeniably, around 155 transports departed from the Rhine to Britain, it remains somewhat puzzling why this would have necessitated the construction of a more robust gate at Arentsburg. One would rather think of an incidental improvement. However, if one were to seek a connection with events elsewhere, one would also be better off focusing on this case to the Rhine. Under the recently mentioned emperor, not only was there fighting in Britain, but the entire surveillance system against the Germans was also improved around 160. A renovation of our castellum fits much better into this picture, in my opinion.

ad c. Dr. Holwerda believes he finds the possibility of a subsequent renovation around the end of the 2nd or the beginning of the 3rd century. This is based on the discovery of pans stamped with the stamp of Exercitus Germ. Inf. As we have already seen, these pans cannot be dated precisely, but they must surely date from after around 160. He also draws on the history of Britain for this possible renovation. He points out that troop transports resumed around 175 and that there was renewed heavy fighting during the reign of Septimus Severus (193-211). This does not seem very convincing. Aside from the fact that tile replacement is sometimes necessary, even without any specific underlying events, if one prefers to consider a more general renewal of the castellum, one might again look much more closely to the Rhine than to Britain. Under Commodus (180-192), numerous changes and improvements to the Germanic Limes took place (e.g., the foundation of the large castellum at Niederbieber). There were also renewed wars against the Chatti and Chauci. It is truly unnecessary to look across the North Sea for an explanation for work on our castellum, regarding Dr. Holwerda points out the significance of some inscription stones, which, in his opinion, originate from Arentsburg. He cites one of the inscriptions, which shows that work on the arsenals was carried out during the reigns of Septimus Severus (193-211) and his successor, Caracalla (198-217). He asks whether there might be a connection between the stone buildings excavated by Revius on the site now recognized as a harbor and the arsenals mentioned in the inscription. He continues: "If so, then we also have a building project here at Arentsburg at a time when this harbor would have served a useful purpose as a staging post to England." As can be seen, he remains trapped until the end by the idea of a connection he sought, the basis of which, however, is difficult to maintain from a military historical perspective. Let us assume that the inscription stones actually come from Arentsburg and that the magazines mentioned on them were indeed the buildings discovered by Revius. Is there then any reason to turn our attention to Britain? Quite a lot happened on the Rhine in those years. Septimus Severus, for example, prepared plans to subdue the Germans. Such plans certainly included the reconstruction or construction of arsenals. Under his successor, Caracalla, wars were waged against the Chauci and the Saxons, that is, near our region. This, too, provides sufficient explanation for the reconstruction of warehouses at Arentsburg. Therefore, I dare say without any hesitation: look closer to home.

ad e. The observed reoccupation of the castellum in 270 is tactically very simple to explain. In that year, the Limes was definitively abandoned, after which the Danube and Rhine would form the border. The work and relocations associated with this reorganization would certainly have necessitated considerable transport on the Rhine. A temporary guard of the Rhine estuary to cover these transports is not only plausible, but tactically essential. The castellum at Arentsburg was perfectly situated for this purpose.

ad f. I am fully aware that discussing ceramics of likely British origin would be treading on very thin ice. And yet, I cannot remain entirely silent on the matter, as it is, in fact, the only point that undeniably points to a connection with England. But this will have to remain a layman's talk.

The remarkable thing about this ceramic is that it was found in a fairly large quantity at Arentsburg, but, as Dr. Holwerda reports, has not been found elsewhere along the Rhine. So it apparently did not reach beyond our castellum. One might think that it was a consignment imported as merchandise, which the importer suffered because it proved unpopular here. But there is another solution, which, at least in my opinion, is more satisfactory. Around the year 150, the Romans very likely transported several British tribes in their entirety from their land to the Limes in Wurttemberg. If this is true, it might explain the presence of this Caramel of British

- 80435 origin in Arentsburg. Anyone who has ever seen, in reality, on a newsreel, or in a photograph, the embarkation of Javanese emigrants destined for the foreign lands, will immediately understand. The caring women naturally brought their pots with them, not only as a precaution, because one could not know what it would be like abroad, but also to have food and drinking water on the way. If such a group of British colonists had to stay in Arentsburg for a while to wait for further transport, then
- 80440 it is conceivable that the women noticed that better or more beautiful pottery was available there. Women are women; they preferred the foreign pottery and left their old pots behind.
- I readily admit that this is a very homely explanation, but for that very reason it is perhaps not so far from the truth.
- 80445
- Summary. From a military historical perspective, it is unacceptable to connect the reconstruction in stone of the castellum at Arentsburg under Domitian with Agricola's war campaign in Britain, which had just ended. More reason to consider this is in connection with the campaign against the Chatti, the continued occupation of their
- 80450 land, and the establishment of the first Limes.
- The construction of a praetorium and villa is difficult to connect with the passage of troop transports destined for England, but rather points to the imminent arrival of a prominent figure, which could point to Hadrian.
- 80455 Some of the other renovations to the castellum could be attributed to Hadrian's wishes.
- The others can be more easily linked to events on the Rhine and in our region than to those in Britain, insofar as they were not incidental.
- 80460
- Conclusion: The Roman fortification at Arentsburg was a simple fortified station of the Rhine fleet and had no other significance than the other stations of the Classis Germanica along the Rhine.
- Correspondence regarding van Giffen's accusations against his son Holwerda.**

- 80490 567a
Dear Sir,
- As I suspected, we—both you and I—have been the victims of fraud. There is no urn field at the location indicated to me, but there is a small area where some urns once stood. However, they have been removed; by whom is easy to guess. Probably, in your
- 80495 municipality, there are still urns, just not in the designated location. Incidentally, there are no specific mounds at that location, as I believed there were. I consider it undesirable to continue further investigation in your municipality and have therefore had the work stopped. The extent to which we are dealing with fraudsters is evident from the fact that the workers actually forced my

80500 amanuensis to pay them their 2 guilders as a daily wage, claiming that I had promised it. In the meantime, I thank you politely for your kind intentions; my visit is now also unnecessary.

Sincerely, Yours sincerely, Dr. J. H. Holwerda, Deputy Director of the National Museum of Antiquities

80505 To the Honorable Mayor of Luijksgestel.

[...] J.W. Moll

80510

[380] ? October 7, 1912

Dear colleague,

Permit me to add a brief written word to the letter that Van Giffen was supposed to send you today, and of which I took note.

80515 I now have a sufficient overview of the matter, also through perusal of the exchanged documents, to be able to express the opinion that there has been more misunderstanding than actual misconduct. And furthermore—and this is the main point—Van Giffen is unjustly distrusted. I can certainly understand that distrust, considering the letter he wrote to you. But now that he has made a full amendment to
80520 that letter, this point, which was the reason for your action, can no longer carry the weight to hit this young man as seriously as you initially intended. I have also thoroughly checked that in all sincerity, no thought of collusion with anyone has ever entered his mind.

80525 However, I have not considered myself entitled to form an independent opinion regarding van Giffen's person and therefore request this two mentors, Moll and van Bemmelen, under whom he worked for many years, to send me their opinions. I hereby submit this testimony to you. I believe it speaks volumes in van Giffen's favor. Since this is the case, since it is a matter of gaining significant strength for your science and keeping alive such a rare and genuine interest in science—I have complete
80530 confidence that your sense of justice and the memory of the cordial relationship that, as evidenced by the letters exchanged, existed between you, your son, and van Giffen, will be able to lead you to the decision to grant him the permanent position he so ardently desires. I remain, yours sincerely and kindly,
H. Krabbe

80535

[277] [October 11, 1912?] Since the faculty issued its previous recommendation, objections to Dr. Holwerda have come to its attention, both through documents His Excellency sent to it for information purposes and through communications provided by some of its members.

80540 These objections are of two kinds:

1. The events concerning Arentsburg challenge Dr. Holwerda's scientific seriousness and sense of propriety.

80545 2. The second objection raised against Dr. Holwerda is even more serious in the faculty's view. It amounts to the claim that Dr. Holwerda would make independent scientific work, and thus the continuation of the work, impossible for young scholars appointed to the Museum as officials, as soon as it becomes apparent that they do not fully share and support his opinions and views. The faculty is of the opinion that, should a serious investigation reveal the validity of these objections, the appointment of Dr. Holwerda as director of the Museum of Antiquities should be
80550 strongly discouraged.

However, the faculty lacks the information to form an opinion on this validity and must therefore declare itself incompetent to issue further advice.

[380] ?? 10 Oct. 2012

80555 Dear colleague,

I owe an explanation for my visit to your son. I asked him whether he was seeking cooperation with v. Giffen and, in that case, considering his likely future position at the museum as his successor, whether he would accept the responsibility of a permanent appointment, which might lead you to grant v. G.'s request.

80560 I had to receive a negative answer to that question.

Sincerely, I remain, Anne L.
H. Krabbe

[380] ?? 11 Oct. 12

80565 Dear colleague,

Should there now be a misunderstanding between us? I hope not. The fact is that the deputy director recommended Mr. v. Giffen to you for a permanent position, after what happened last summer. Since your son had now demonstrated such a benevolent attitude and will in all likelihood be responsible for the museum's affairs, there was every

80570 reason to ask him the question, which, if answered affirmatively, would have made it easier for you, in my opinion, to grant Mr. v.G.'s request. Your son appears to have changed his mind.

My efforts, which I initiated at the request of my friend Moll, with the museum authorities have now come to an end.

80575 Convinced of your good intentions, I remain yours sincerely and with pleasure.
Yours sincerely. H. Krabbe

[277] Draft response (Unification of the professorship of archaeology with that of director of the

80580 Museum of Antiquities).

Response of the Faculty to the letter from the Curators of October 11, 1912, (sent October 21, 1912) regarding the unification of the positions of Professor of Archaeology and Director of the National Museum of Antiquities.

We hasten to respond to your letter of October 11, 1912, No. 793.

80585 Your committee poses two questions:

1. Whether the unification of the professorship currently held by Professor Holwerda with that of Director of the Museum should be permanent?

2. Who should be considered as Professor Holwerda's successor as Director? Regarding the first question, we would like to point out what our faculty already noted in its

80590 1903 advisory report to your college, when the question of combining the two positions was raised. The faculty was of the opinion at the time that it would be desirable in many cases for the Professor to be the directing head of the institution where his study material is kept; that "however, no hard and fast rule can be

80595 established in this regard, as various circumstances may arise that make a different arrangement preferable."

The reason why the faculty, back in 1903, recommended the association was that "at that time, the museum needed strong leadership; it truly wanted to serve the interests of the public as well as those of the academic community in the future, and one could expect that the then-incumbent, Professor Holwerda, was the man to provide

80600 that leadership."

The association was therefore advocated solely because of the circumstances and the personality of the then-professor.

That the association, while highly desirable in certain cases, nevertheless had its drawbacks, was always recognized by the faculty, and Professor Holwerda, in

80605 particular, stated, according to the minutes of the faculty meeting held on this matter, that he found the combination extremely difficult, but that he accepted it for the sake of the future. The faculty believes that there are cases in which the combination of the two positions need not be objectionable to either party, but that even in cases like this one, where it was objectionable, it could still happen that a

80610 Professor will have to make a sacrifice, like Professor Holwerda did in 1903.

However, as far as the National Museum of Antiquities is concerned, it is now effectively organized and in the interest of the public and the academic community. We should advise against the combination of the two positions just as strongly now as we advised against it in 1903.

80615 Your board rightly notes that the appointment of a new director does not imply a commitment that he or she will later succeed Professor Holwerda as Professor. Rather, insofar as this expresses the principle of separation, it is the opposite. We would therefore consider a temporary appointment highly inappropriate.

In 1903, the question of personalities also weighed heavily, and this naturally leads us to an answer to the second question. Undoubtedly, we are now in much more

80620 favorable circumstances in this respect than in 1903. Indeed, it is safe to say that Prof. Holwerda could not have carried out such an extensive reorganization effort without the effective assistance of Deputy Director Dr. J.H. Holwerda Jr.

Most of the new museum design was carried out directly by the Deputy Director after prior discussion, often also based on his insights. The current highly effective

80625 organization of the national supervision of finds entrusted to the museum and of the systematic research of our soil is thanks to his energy and insight. He is a practical and forceful leader who will never lose sight of the importance of studies at our University.

80630 We therefore consider him the most suitable person for this position.

Should your council wish us to appoint more than one person, we would secondly

mention Deputy Director Dr. P.A.A. Boeser, who worked at the museum for several years. However, we can hardly seriously recommend him over the former. A final remark. It happens that an official affiliated with a library, museum, observatory, or similar institution as an extraordinary professor or lecturer is assigned to teach in their specialty. In our opinion, this is highly desirable. However, the issue here is different. The question is whether to attach a directorship to an ordinary professorship; but conversely, to assign a director or museum official the additional position of lecturing in a limited area.

[173] Leiden, November 26, 1912

My dear colleague

The interest you have shown, for which I am very grateful, means that I would like to share with you in a few words my decision.

I have no control over all these slanders and disparages, as they are done secretly. Therefore, I cannot speak to the minister about them except in the vaguest terms.

The honesty of myself and my son, and also the scientific merit of the latter, are far too high for me to justify ourselves in these respects without an accusation being publicly made.

Very soon after your departure, this insight dawned on me.

I consider any action by the least of my own selves far beneath me. I will certainly leave the field open for Mr. Lohman. So be it. Aderenne qui pourra.

I had to speak to Mr. R. again, as usual, and I also asked him briefly about this. He agreed with me completely. However, I had already made up my mind when I asked him. Thanking you again, with kind regards, also to Madam, as always.

?? A.E.J. Holwerda

[173] Leiden, 28 Nov. 1912

My dear colleague,

Although I am convinced I cannot go to the Minister with it, I still owe you my

thanks for your information. Indeed, I do not know at the moment how it would be advisable to use it in any other way. Now, I believe I understood that I was not allowed to mention your name. That must have been a misunderstanding. What objection could you possibly have to that? May I then, if I deem it appropriate, say, colleague Blok told me that someone (me, that is), a friend of Mr. van Giffen, heard and informed him of this and that.

And then, the person who brought it to you is a good man. However, the action was considered otherwise? To accuse him of forgery without that person having any right to do so is not good.

And then, surely there can be no objection on your part to informing that informant that you are preventing me from pursuing the matter. It would then be sent to them in a sealed letter.

With this, he is even more obliged than you already are to me.

P.S. My son will be back in town this evening. I will, of course, inform him.

[173] Leiden, November 28, 1912

Your Honor,

I learned from my colleague Blok that someone has made very serious accusations to him against me and the deputy director, Dr. Holwerda.

I summon you to repeat these openly to us. The Professor and Director of the National Museum of Antiquities

A. E. J. Holwerda

[268] Leiden, December 23, 1912

Your Highness,

A new, enormous fact in the Van Giffen case has come to light. We have a prospective draftsman, Mr. H. Martin, who can perform his services as a draftsman, and we wanted to see if he could also learn something more. He and Mr. van Giffen accompanied us to Arentsburg. Neither of them yet knows anything of any significance about Roman archaeology, but the deputy director could then let them participate in the work to see how far they had learned about excavation. Mr. Martin proved unsuitable for it, Mr. van Giffen not.

I nominated Mr. Martin as an assistant for a year, during which he can do work for which he is well-suited. I considered him a respectable young man.

I had to advise Mr. van Giffen very decisively because of his character traits and opinions.

Now the deputy director of the Arentsburgh Association receives a report containing a complaint from Mr. van Giffen—the student, N.B.—that Dr. Holwerda, his mentor, is not doing the work properly.

In that document, Mr. van Giffen also mentions that he had discussed the same matter with Mr. Martin in a memorandum addressed to the President-Curator, which also complains about "unspeakable circumstances."

I have now provided Mr. Lohman with a detailed dossier concerning Mr. van Giffen. In the discussion about the matter, Mr. Lohman raised virtually no points from that dossier. I heard nothing, then or later, of the charges brought against us. Thus, the President-Curator accepted a complaint against my museum management from a probationary museum official without informing me and thus allowing me to justify myself. The probationary official was someone I declared it would be irresponsible to appoint permanently, an opinion I had clarified with a series of facts.

One understands the intention: Mr. van Giffen, who still has to learn his trade, must obtain a permanent position in the museum against us.

For us, it is becoming a matter of defending our own honor and dignity.

I urgently request you to inform His Excellency of this.

How is it possible to keep Mr. van Giffen in the Museum any longer?

I hope and trust in the Government's justice.

Sincerely,

dn A.E.J. Holwerda

Right Honourable Sir J. B. Kan

Secretary General at the Ministry of the Interior.

Not exactly as provided to Mr. Kan

[268] letters from Professor Holwerda to Minister Kan regarding Van Giffen
Leiden, 13 January 1913

Your Excellency,

It has come to my attention that a meeting of the Curators recently took place, at

80765 which, among other things, the existing difficulties concerning the Museum of Antiquities were discussed.
To my regret, I was not summoned to that meeting. I deeply regret this, as the matter could probably have been clarified through joint discussions. Now, there is no doubt that, in connection with this entire matter, accusations against me as museum director were also brought before the Curators. Therefore, should anything
80770 unexpectedly come to Your Excellency after this meeting that directly or indirectly points to an unfavorable assessment of my museum management, I believe I can trust that no decision will be made by Her even remotely based on such an unfavorable assessment without first hearing me.
With respectful regard.
80775 Your Excellency, obedient servant A. E. J. Holwerda, Professor-Director of the National Museum of Antiquities
To His Excellency the Minister of the Interior

[268] 23 1 Mr. J. B. Kan
80780 Right Honourable Sir
His Excellency was indeed kind enough to speak with me briefly this morning. I also spoke about the Giffen case. May I be so bold as to clarify this for you once again?
Because Mr. van Giffen, the probationary curator, is distrustful and unreliable, yet
80785 doesn't interfere with any authority under the rules, doesn't understand that working in the museum's interest requires collaboration with others, I strongly advised against continuing the experiment with him.
A complete dossier submitted to the Curators supported this assertion. It's not my fault that the gentlemen apparently ignored this.
80790 Now comes the Arentsburgh case: Mr. Martin. The snakes of Mr. van Buiten Uelleb. Mr. van Giffen and his friends have sent two officials, whom I, as director, sent to Arentsburgh to assist the deputy director.
The choice of Giffen and Martin, so that the most? menadhelmerk hv
80795 on the ?? did the following. That evening, using Dr. Holwerda's drafts, which had been entrusted to Mr. Martin in his official capacity as a draftsman, the well-known indictment was drafted. This was handed over to a private committee entirely without my knowledge. In my opinion, this is a very flagrant violation of official duty. Mr. Martin acknowledged this on behalf of me and Dr. Boezer, but had done so "on the orders of Mr. van Giffen," "his superior," as he added on another occasion.
80800 The Arentsburgh committee was clearly very favorable to the Lord. Both gentlemen, he also briefly and casually indicated that at least 14 of the 15 accusations were either unproven or refuted, i.e., that they were false accusations.
As evidenced by a letter from the Curators to the deputy director dated January 27th. Last year, Mr. van Giffen also used two unsolicited statements to the President
80805 Curator, making unsolicited representations.
In the document addressed to the Arentsburgh committee, Mr. van Giffen stated that he could not cooperate with the head of his department (see page 7).
Such a person who, behind the backs of his superiors, tells at least 16 untruths about outsiders, even the simplest rules of conduct, and who, moreover, claims to be
80810 unable to cooperate, should be banned from the museum. This is not a matter of "expulsion," as he is not yet in. The consequences then.
The minister still attached great importance to the Proposal unfounded.
The idea that this is a "sprinkle" with the museum is definitely incorrect. A person is on probation, and the question is: should that probation be continued?
80815 The minister still considered less favorable treatment on the part of the deputy director.
This seemed to me to be the crucial point.
I must respect that. That His Excellency
I respect that this must be taken into consideration, understanding is self-evident.
80820 What the Minister may be assured about this rests beyond doubt that that secret dossier, about which we are not opposed, is further raised.
However, he primarily agrees with an assurance from Mr. van Giffen himself, just as the scientific impropriety of the Arentsburgh committee was also mentioned.
This was because
80825 the Arentsburgh committee only accepted Mr. van Giffen, the man who, according to that committee itself, had numerous 14 unproven or refuted accusations.
I understand the minister's difficulties. How can he...
However, it strikes me who should be held accountable?
Are the charges of...? Is this necessarily...?

80830 Clear counter-evidence cannot be found in my document to His Excellency, in the memorandum that Professor Nieuwenhuis sent to the SD?
This is something else, which he informed me he sent to the Minister.
I could also submit a letter from Professor Goossens from Rolduc, who heard about the matter and now writes about the humane way in which Dr. Holwerda treats young people.

80835 Assuring such a man a position in the museum, which he does not yet hold, seems impossible to me.
It is another matter to give him a period of transition, even if it is in the museum's interest that it be short. Mr. van Giffen has actually already had several requests for transition. How would it be possible to keep him on longer? What the

80840 minister might want to do to ease this transition is another matter. In the absolute interest of the museum, in the interest of order and authority, it is important that this transition be as short as possible.
I do not understand how it is possible, after all this, to keep such a person in the museum, even though I am...

80845 With all the compassion I can feel for the young man, I am reluctant to resign myself, but I must point out that his stay in the museum is detrimental in many ways. Your Excellency

This morning...

80850 May I just inform you that I had a conversation with His Excellency the minister. Respectfully but very firmly, I said that I might soon find myself in the very sad necessity of openly defending our honor and good name as well. F The name of the high-ranking person F I? One name in particular. I cannot tell you how much I hope I will be able to remain silent.

80855 His Excellency seemed not unwilling, not entirely unwilling, to continue Mr. van Giffen.
He has only been appointed temporarily to continue, whom he has not been appointed to provide a position in the museum.
I have previously pointed out that this gentleman is distrustful and even unreliable,

80860 that he cares for no order, no rules, no authority, and does not realize that he and the museum's interests have the interest of working and collaborating with others. I have insisted on this with numerous documents.
Later, this gentleman, violating all the rules of the art, quietly, with the help of officials entrusted to his position, filed a complaint against me, to be submitted to

80865 the Arentsburgh committee. This committee issued the following statements, which were strongly supported in his favor.
I have, without hesitation, refuted the 15 points of accusation by the delegated party as unproven. Mr. v. G. himself states in this document that they are not just able to cooperate.

80870 Although the curators indicate in a letter dated January 27th that Mr. van Giffen also has "real advantages to offer" compared to Mr. President Curator, they apparently remain willing to have them/him retained in two respects. He has spoken. It seems to me that he really still supports the museum.
He is apparently still willing to grant a position in the museum that he does not yet

80875 have.
I had to point out to His Excellency the Minister that this would be an insult to me that I cannot allow myself to be subjected to.
Here, Your Excellency, is a brief account of what I have endured in a matter in which you too are of some interest, although you are, of course, completely outside the

80880 scope of this matter.
I have the most pleasant memories of the conversation I had with you, should you be so kind as to grant me permission, and I ask that my kind regards also be extended to Miss your daughter. Sincerely, I have the honor to
Thank you for your kindness.

80885 Sincerely,
Although Your Excellency fully respects the advice, after the kind reception I received, I nevertheless felt compelled to keep you somewhat informed.
P.S. Already for a few days
When I noticed that even a stranger was willing to treat the institution we created

80890 as it is, I asked the Minister to consider my application for resignation as withdrawn.

[277] [early 1913] Very confidential 1
To avoid having to write the same thing over and over again, I would like to inform

80895 my friends in this way of the almost unbelievable intrigues of which I have been the

victim.

In September, my father wanted to request his resignation as director of the museum (not as a professor, because both positions are ultimately incompatible), and I applied to be his successor. My colleague Boeser himself did not want to and supported me and the Literary Faculty brought a proposal for me. The advice was favorable.

Meanwhile, we had a temporary curator at the museum, a young man [van Giffen] with a doctorate in Natural History, but with great ambition for my profession, which he would learn from me. He also accompanied me on a few excavations. This young man was determined to be appointed, and when that initially seemed to be possible, he came up with all sorts of demands: the most important of which was that I withdraw almost entirely from the indigenous section of the museum. Everyone knows that this section is essentially entirely my creation, and so I understand that I was not interested. Yet, I had already come a long way towards accommodating him when, through various dubious actions on his part, it became clear that continuing the experiment with him was undesirable. My father, as director, made this decision entirely independently and informed him of it. This was the signal for him to launch a smear campaign against me, who, as I dare say, has always been equally lenient towards him. His father, an orthodox minister, appeared on the scene, and Mr. Krabbe, a law professor, through Groningen connections of this young man from Groningen, tried to work for them. Mr. K. also came to me and asked me, "because I had always been so kind to the young man and yet was my father's designated successor," to put in a good word for him with my father. I had to refuse, of course, and a month later Mr. K. went around telling me it would be a disgrace if I succeeded my father, as well as all sorts of slander regarding my scientific work; I had actually accomplished nothing. He oppressed junior officials, etc., etc. I only learned of the slander much later. Meanwhile, the "Christian" action also began. The president summoned my father and threatened him that if he maintained his unfavorable advice regarding the young man, he would have to face the consequences. Of course, my father could not, for his conscience's sake, be forced by threats. So the consequences were bound to come. The young man in question collected all sorts of written accusations against my father and me, and these were used as a secret dossier against us. Neither of us was ever questioned about any of the accusations, despite our repeated requests. And even then, we were completely unaware of the nature of these accusations. They remained secret in the hands of the President, Curator Mr. de Savornin Lohman. Based on these secret accusations, a very unfavorable proposal was made in December, and it almost became reality. I would have been virtually prevented from working at the museum I had actually founded, and I would have been forced out of the study I myself had introduced in our country. All because of a combination of slander and so-called Christian justice. The exact nature of the accusations was still kept secret from us. I would have been sentenced without being able to defend myself.

By chance, or should I say, the honest believers among my friends of a board, the evidence of the slander came into my hands a few days before the verdict. The young man, assisted by a draftsman who was also leaving our museum, had also attempted to harm my work by bringing his slander to the chairman of the Arentsburg Association. He had confided in me that I wasn't on very good terms with Mr. Gratama, a colleague of Mr. Lohman in the Supreme Court. Instead of chasing the young man out, he took the accusations seriously and called me [2] to account. Suddenly, a few days before the decision, I received the entire slander file concerning my work. I had it printed with my defense. From the enclosed booklet, especially from page 23 onward, everyone can see how these young men had acted against me. The department was indignant and completely on my side. I personally circulated my booklet among the Curators, and I know from a reliable source that from that time on, the other Curators no longer participated. Against the advice of the faculty against the department, only the personal influence of Mr. Gratama remained. Lohman on his coalition partner. To strengthen himself, the Arentsburg Association now had to serve. After six weeks, I was asked to come and provide some further information, and to my indignation, I found both young men there. Mr. Gratama, along with two others who, of course, had no idea of my profession either, then went to court with those two young men as prosecutors and experts. You can imagine how insulting. If I hadn't left it at Arentsburg for the work, I would have walked away. There was nothing to be found, of course, and so the work was assigned to me again. * To spare those boys further, I...

In their article, the gentlemen indulged in certain expressions regarding my scientific activities and conclusions, such as only those completely ignorant of the field can make, and I was even vehemently reproached for informing curators and other

authorities of the accusations. As what gradually became known about the secret dossier became increasingly concerned, these people naturally became more and more concerned, and it gradually became a matter of saving his reputation. The acquittal was that Arentsburg had to be disguised as darkly as possible. If it weren't such a serious matter, it would be ridiculous how three complete laymen—Judge Gratama, archivist Kraemer, and engineer Welcker—speak of my archaeological work as if I were any ordinary rascal. With that judgment, they then brought it to the minister, who simply didn't dare follow his department's advice against Lohman. Meanwhile, we heard that he had been searching for a rival candidate in Berlin. He had also been told there that I was the right person. Now the Arentsburg document was sent to the faculty, asking them to reconsider their favorable recommendation. Mr. Krabbe and his friends were once again vigorously prodding faculty members against me, but I found some very ardent friends and defenders in it, so the faculty stuck to its previous recommendation. We understood, however, that Lohman would not give up, and therefore, on the advice of some friends, my father withdrew his request for resignation. This puts an end to the intrigue. We hope that the elections will free us from political influence in this matter. Meanwhile, Lohman has persevered to the extent that his protégé, despite making himself virtually impossible with everything he did, will remain in office, at least for this year.

The danger to my work has now passed, however, and we can gradually begin to speak. In response to the grievous treatment by authorities who have not the slightest idea of my work, I have asked some of the foremost in my field abroad to express their opinion of me and my work, and I believe the most worthy response on my part would be to send those authorities only that response. I am also attaching it here. For the rest, we must await better times.

* Meanwhile, to wait and see, Mr. Gratama, who hoped that someone else would become director, has postponed the work.

[277] [March 1913] At the Faculty of Arts and Philosophy of the State University of Leiden. (March 1913)

Confidential

At the faculty meeting of March 4, Mr. van Leeuwen asked why no appointment of director of the National Museum of Antiquities had yet been made. I could only provide some preliminary information at the time, but the matter apparently attracted considerable attention, as it does even outside our faculty circles. Some further explanation, even if not intended for publicity, therefore seems desirable.

[in the margin] The dean understood that he should not read this letter addressed to the faculty because of the word "confidential."

Last year, a doctoral candidate in natural history was appointed as a probationary curator. As such, he needed archaeological training from us if he wanted to actually act as a curator. Gradually, however, I began to have increasingly serious doubts, due to his character traits, whether it was advisable to continue the trial with him, and I felt it necessary to give him a very precise description of his position and relationship at the museum. I did so (October 22) in a document that I offered to discuss with him; which he declined. I demanded that he answer a few questions about this matter and another before November 1st.

Meanwhile, the father of that young man, a minister in Friesland, had already tried to pressure me and had separated from me with the words: "So you don't want to, then I know where to go." Furthermore, Professor Krabbe had tried the same here, not only with me but also with the deputy director, Dr. Holwerda, whom he appealed to as my "presumptive successor."

As you know, I requested my resignation [p. 2] as director last September, after having informed the Curators of my intention to do so in the preceding February, so now over a year ago, in order to give them all time to become aware. A somewhat peculiar objection was raised by the Curators at our faculty at the time (early October), as if appointing a director would obligate them to later appoint the same person as my successor as professor. They invoked this objectio on the correspondence of 1903, as if the faculty had advocated a permanent link between professorship and directorship, although in that very correspondence the faculty had argued the opposite: linking the two positions could only be desirable in certain cases. Apparently, there was a certain fear of nepotism among the Curators. However, the faculty knows how much I, especially now that the museum had expanded so much, considered such a link highly undesirable, and how the person wishing to be considered for director feels the same way.

On October 26, I was summoned by the president-curator, who said he wanted to speak with me about "difficulties that had arisen" between the deputy director and the

temporary official in question. In this way, two completely unrelated matters were linked for the Curators: my dismissal and the question of whether the official's character traits prohibited them from continuing the trial with him. It turned out that the official had gone to the president-curator with the document concerning his position in the museum, which he had refused to discuss with me, and, for understandable reasons, had presented this matter as one between him and his director, as one between him and the deputy director.

[p. 3] The president-curator not only accepted these complaints but, as I later learned, also released him from the obligation to answer my questions to his superior at the appointed time. When the deadline expired, I received a request from the president-curator not to hold him to that deadline. Even after that, I received no response to my questions.

That questionable situations had arisen in the museum, the likes of which we had never previously encountered, is understandable and will become even more understandable from the facts to be reported shortly. It goes without saying that I am not responsible for this.

Meanwhile, the president-curator wrote to me that the temporary official in question had gathered "written information" for him. On November 9th, I had a meeting with the presiding curator, whose character is best understood from a portion of a letter I addressed to him immediately afterward.

"I would like to repeat to you that I do not know the Lord ... and cannot recommend him, not even for a renewal of the examination."

"I know how you judge this, but a human judgment, from anyone, cannot prevail over that of conscience. If you should wish to question the sincerity of my convictions, I must let it pass."

"You speak of certain consequences that the pronouncement of my judgment could have. I don't know what you mean by that, but it doesn't matter to me. The consequences may come. I have no choice."

I never received a reply to that letter.

[p. 4] So I had to await the consequences of a recommendation issued according to my conscience. Not long after, a colleague from our faculty warned me that a smear campaign had been launched against us. A colleague from another faculty—he didn't mention his name—had come to him to see if it would be possible to persuade the Faculty of Arts to reconsider its very favorable recommendation regarding Dr. Holwerda. Dr. Holwerda, he assured me, was highly incompetent. All sorts of nasty things were said about him and me; the most important, however, was that Dr. Holwerda had falsified scientific data. If that colleague from our faculty showed even the slightest inclination to cooperate, he would receive a visit from the president of the board regarding this matter. As I understand it, that same professor had also approached other members of the faculty for the same purpose.

I began to suspect that the professor's slander and the "information" the president of the board had received were identical, and I also sensed the consequences of my advice. A work to which we had devoted 10 years of our lives would be jeopardized; the man whose tireless work first and foremost made the museum the flourishing institution it is today would be pushed aside, the man who also elevated the archaeological soil research commissioned to that museum to such great heights. For health reasons, I have had to withdraw more and more in recent years. As a result, the management of the internal museum operations has fallen entirely into his hands, and everything is now going excellently [p. 5] because the officials feel the support of his good judgment and firm hand; these officials cannot imagine working under any other manager. This successful course of events would be brought to an end. All this as a consequence of not advising against my conscience.

It later turned out that I was right. However, I didn't know at the time what had been decided at the curators' meeting of December 4th. Moreover, the slanderous gossip had come to us in such an indeterminate form that we had no control over it. Suddenly, however, we received more light. Through a document sent to him by the Arentsburgh Association—a document that had originated with the help of another official—the deputy director obtained a complete dossier of slanderous allegations. He had this printed with his response and allowed me to send you a copy, although not intended for publication.

Then we also learned what the main accusation was, that of forgery, which had been brought to the curators and spread by that professor. It concerns Dr. Holwerda's maps of the excavations at Arentsburgh from 1910 and 1911, of which tracings had been submitted to prove that they did not match and had been assembled through tampering. This accusation, however, was only possible because the accusers had omitted the words "provisional map" from the first map and had failed to mention that Dr.

81095 Holwerda had deliberately added this because he had deemed a further inspection of his map necessary in 1911, which he had carried out at that time.
[p. 6] The nature of the accusations will be further clarified in the printed material sent to you.

81100 I then spoke with His Excellency the Minister of Internal Affairs. Based on his instructions, I declared my willingness to temporarily remain in charge of the directorship in order to save the institution and give His Excellency the opportunity to investigate.

81105 At the beginning of January, the deputy director visited each of the curators individually with the printed document. It has now also been established that my suspicions regarding the Curators' conduct in this matter were entirely correct. That the "information" provided to the Curators was, at least in part, actually identical to the slanderous gossip was evident not only from the document sent to Arentsburgh, but also from a letter the Curators addressed to the deputy director on January 27th. It is also certain that this "information," particularly the two maps, constituted a point of consideration for the Curators. Likewise, decisions were made against the faculty's advice, and, as regards the temporary official, against my advice, even though this was supported by a comprehensive array of documentary evidence. I must note here that

81110 1. the president of the curator did not inform me of the content of this "information" in the aforementioned conversation.
2. I never heard any appointment policy from the curators.
3. Dr. Holwerda was never heard about the accusations made against him.

81120 On January 8, the Curatorial Board held another meeting [p. 7]. Professor Blok, the only professor in our faculty who had a public disagreement with Dr. Holwerda (I do not, of course, mean to say anything unfavorable to our colleague), was invited to provide information. Again, I was not heard. The fact that the deputy director is my son seems to me to disqualify the institution I mentioned above from giving advice and to place the deputy director himself outside any official legal relationship. The latter submitted a document requesting a hearing if any doubt remained about his guilt. I understand that a decision is currently awaited from the Arentsburgh Association, which has appointed a committee for this purpose (*). I do not know on what grounds such a committee can be granted any jurisdiction in University affairs. It can hardly be considered an expert committee in archaeological matters. Better experts could certainly be found in our faculty, although no one will present

81125 themselves as an excavation technician. Moreover, this is not a scientific judgment, but a judgment of honesty and good faith, which anyone who wishes to consider the accusation and defense can form.

81130 [p. 8] From the above, it will have become clear to you on which matters the interests of the institution, which you also care about, have been made dependent. Allow me to ask whether it would not be incumbent on the faculty to champion those interests. An institution that is of great significance to our University and is increasingly known with great honor has been placed in grave danger.

81135 Leiden March 1913 A. E. J. Holwerda

81140 [p. 7] (*) It is less relevant here that this committee, which only addressed the matter six weeks after receiving the printed material, was extremely angry because Mr Curators had been informed of the matter in this manner, but nevertheless, in a very condescending and unpleasantly worded document, which would lead one to expect the opposite, ruled out all questions of falsification and once again entrusted the

81145 further management of the excavations to Dr. Holwerda.

81150 [277] [April 1, 1913] Note from the Professor-Director of the National Museum of Antiquities regarding a letter from the Curators to the Faculty of Arts and Philosophy.

81155 His Excellency the Minister of the Interior felt compelled to request a new opinion from the Faculty of Arts and Philosophy last March regarding the person of one of the deputy directors of the National Museum of Antiquities. The Faculty then requested the submission of the dossier of documents that had assisted the Curators in forming an opinion on that person. This was refused in the following letter.

Curators of the State University of Leiden.
Both April 1, 1913.
No. 309.
Message in writing dated:

81160 March 17, 1913.
Subject: Directorate of the Museum of Antiquities.
In response to your letter mentioned above, and authorized by A. E. the Minister to do so, we have the honor to inform you of the following.
The Minister was under the impression that your faculty was not unaware that
81165 objections had been raised against Dr. Holwerda regarding the museum's management since its advice of October 21, 1912.
Now, it was not the Minister's intention to obtain your opinion regarding the facts that had become known during the investigation of the objections raised, which would encounter various difficulties. However, he believed that what your faculty or its
81170 members might know about Dr. Whether Holwerda was already known, or has become known since her aforementioned advice, could have prompted your faculty to further consider her advice regarding the provision of the Directorate of the Museum of Antiquities, given the circumstances.
Although, as your faculty rightly notes, the documents now sent to it specifically
81175 concern the Arentsburch case, the Minister appreciated bringing them to your attention, not with the intention that your faculty should investigate the soundness of the judgments expressed therein, but merely for information purposes.
Curators of Leiden University. Signed by the President and Secretary.
To the Faculty of Arts and Philosophy of Leiden University.
81180
This document gives rise to the following comments:
It is known that a probationary official, Mr. A.E. Van Giffen, whom I do not recommend for further appointment, sought all sorts of accusations concerning my
81185 museum management and the work and person of one of my deputy directors, which were widely circulated. These accusations were also brought to the Curators in the form of written "information," as the President Curator wrote to me. However, when, in January 1913, the deputy director's defense against accusations by Mr. Van Giffen also became known to the Arentsburch committee (accusations partly corresponding to those contained in that "information"), the Curators wrote on January 27, No. 18 sent
81190 a letter to that Deputy Director in which they noted that "insofar as it is up to them to make a decision regarding what allegedly happened at Arentsburch, that decision will not be made until after an on-site investigation where appropriate." The matter was made dependent on the ruling of the Arentsburch Commission.
After that ruling was issued in February, the letter of April 1st, mentioned above,
81195 indicated that, according to the conclusion, the Arentsburch case was of secondary importance. What was needed now was an investigation, outside of the now-demonstrated slanderous Arentsburch accusations, an investigation into objections raised against that Deputy Director "in connection with the museum management," which allegedly revealed "facts."
81200 The faculty could not disclose what those facts were. They were only referred to what the "faculty or its members may have learned about the person of that Deputy Director," that is, to what Mr. van Giffen had reported everywhere. scattered accusations.
Now, the only thing to be noted here is that:
